Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Obsolete
Number of LABs/CLBs	-
Number of Logic Elements/Cells	10000
Total RAM Bits	221184
Number of I/O	244
Number of Gates	-
Voltage - Supply	1.71V ~ 3.465V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	388-BBGA
Supplier Device Package	388-FPBGA (23x23)
Purchase URL	https://www.e-xfl.com/product-detail/lattice-semiconductor/lfxp10c-4f388c

Introduction

The LatticeXP family of FPGA devices combine logic gates, embedded memory and high performance I/Os in a single architecture that is both non-volatile and infinitely reconfigurable to support cost-effective system designs.

The re-programmable non-volatile technology used in the LatticeXP family is the next generation ispXP™ technology. With this technology, expensive external configuration memories are not required and designs are secured from unauthorized read-back. In addition, instant-on capability allows for easy interfacing in many applications.

The ispLEVER® design tool from Lattice allows large complex designs to be efficiently implemented using the LatticeXP family of FPGA devices. Synthesis library support for LatticeXP is available for popular logic synthesis tools. The ispLEVER tool uses the synthesis tool output along with the constraints from its floor planning tools to place and route the design in the LatticeXP device. The ispLEVER tool extracts the timing from the routing and back-annotates it into the design for timing verification.

Lattice provides many pre-designed IP (Intellectual Property) ispLeverCORE™ modules for the LatticeXP family. By using these IPs as standardized blocks, designers are free to concentrate on the unique aspects of their design, increasing their productivity.

Figure 2-18. Group of Seven PIOs

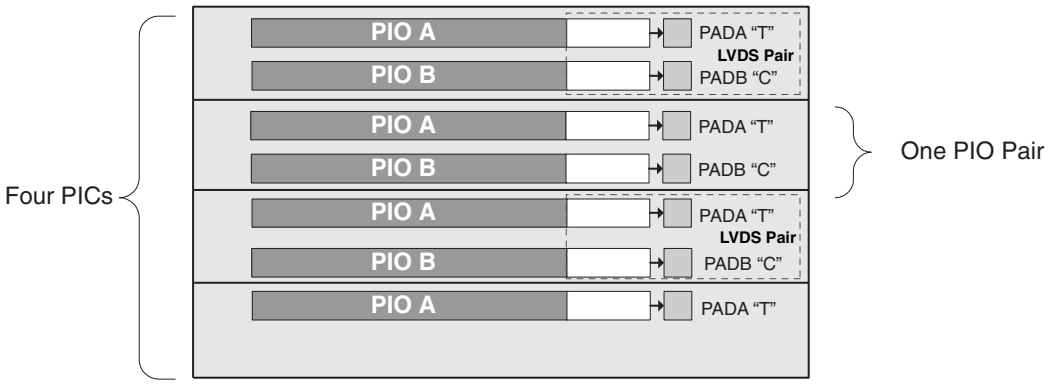

Figure 2-19. DQS Routing

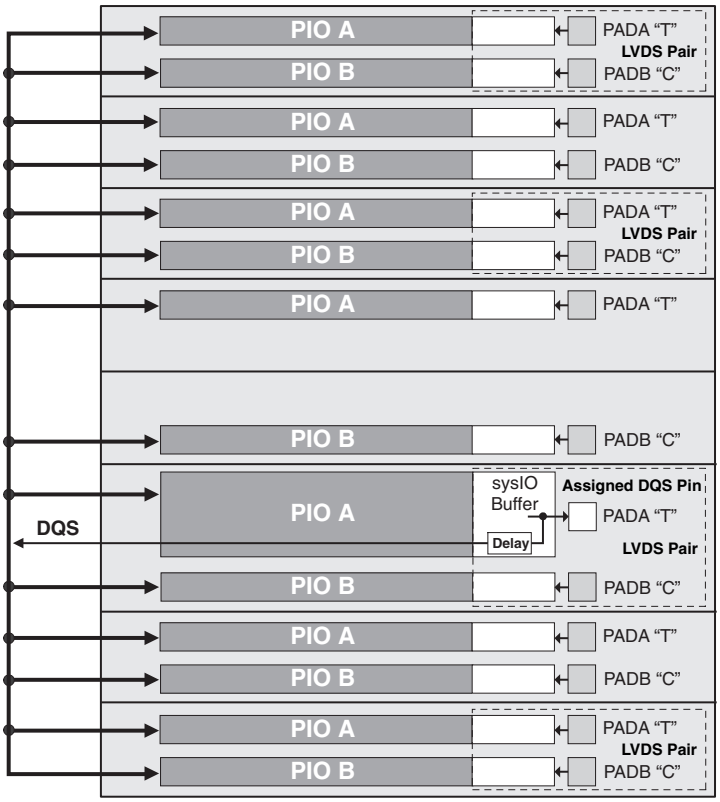

PIO

The PIO contains four blocks: an input register block, output register block, tristate register block and a control logic block. These blocks contain registers for both single data rate (SDR) and double data rate (DDR) operation along with the necessary clock and selection logic. Programmable delay lines used to shift incoming clock and data signals are also included in these blocks.

Input Register Block

The input register block contains delay elements and registers that can be used to condition signals before they are passed to the device core. Figure 2-20 shows the diagram of the input register block.

Input signals are fed from the sysIO buffer to the input register block (as signal DI). If desired the input signal can bypass the register and delay elements and be used directly as a combinatorial signal (INDD), a clock (INCK) and

Figure 3-2. BLVDS Multi-point Output Example

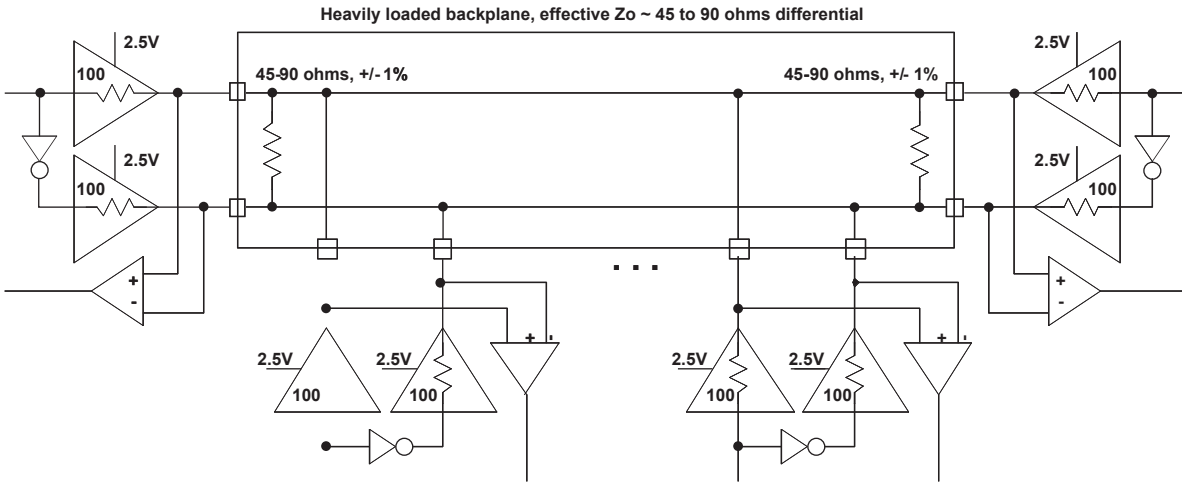

Table 3-2. BLVDS DC Conditions[1]

Over Recommended Operating Conditions

Symbol	Description	Typical		Units
		Zo = 45	Zo = 90	
Z_{OUT}	Output impedance	100	100	ohms
R_{TLEFT}	Left end termination	45	90	ohms
R_{TRIGHT}	Right end termination	45	90	ohms
V_{OH}	Output high voltage	1.375	1.48	V
V_{OL}	Output low voltage	1.125	1.02	V
V_{OD}	Output differential voltage	0.25	0.46	V
V_{CM}	Output common mode voltage	1.25	1.25	V
I_{DC}	DC output current	11.2	10.2	mA

1. For input buffer, see LVDS table.

LVPECL

The LatticeXP devices support differential LVPECL standard. This standard is emulated using complementary LVCMOS outputs in conjunction with a parallel resistor across the driver outputs. The LVPECL input standard is supported by the LVDS differential input buffer. The scheme shown in Figure 3-3 is one possible solution for point-to-point signals.

Figure 3-3. Differential LVPECL

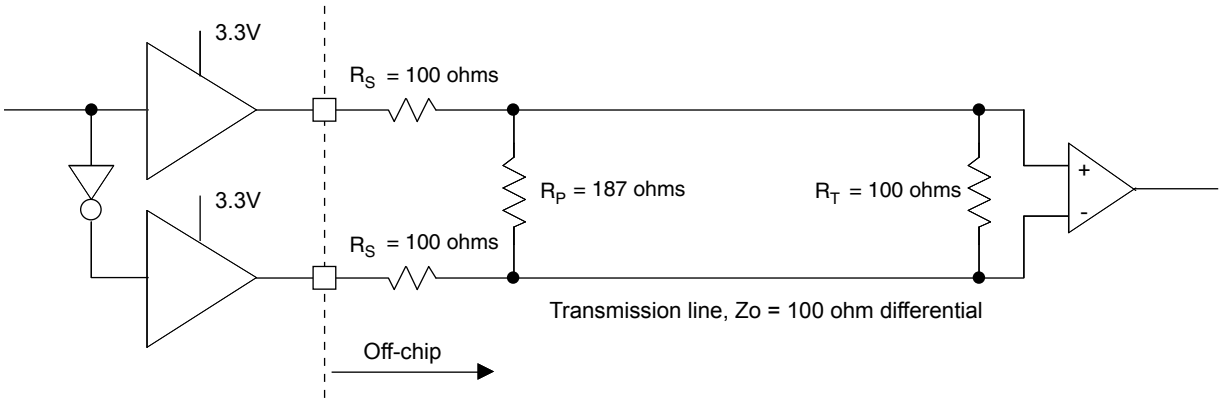

Table 3-3. LVPECL DC Conditions[1]

Over Recommended Operating Conditions

Symbol	Description	Typical	Units
Z_{OUT}	Output impedance	100	ohms
R_P	Driver parallel resistor	187	ohms
R_S	Driver series resistor	100	ohms
R_T	Receiver termination	100	ohms
V_{OH}	Output high voltage	2.03	V
V_{OL}	Output low voltage	1.27	V
V_{OD}	Output differential voltage	0.76	V
V_{CM}	Output common mode voltage	1.65	V
Z_{BACK}	Back impedance	85.7	ohms
I_{DC}	DC output current	12.7	mA

1. For input buffer, see LVDS table.

For further information on LVPECL, BLVDS and other differential interfaces please see details of additional technical documentation at the end of the data sheet.

RSDS

The LatticeXP devices support differential RSDS standard. This standard is emulated using complementary LVCMOS outputs in conjunction with a parallel resistor across the driver outputs. The RSDS input standard is supported by the LVDS differential input buffer. The scheme shown in Figure 3-4 is one possible solution for RSDS standard implementation. Use LVDS25E mode with suggested resistors for RSDS operation. Resistor values in Figure 3-4 are industry standard values for 1% resistors.

Figure 3-4. RSDS (Reduced Swing Differential Standard)

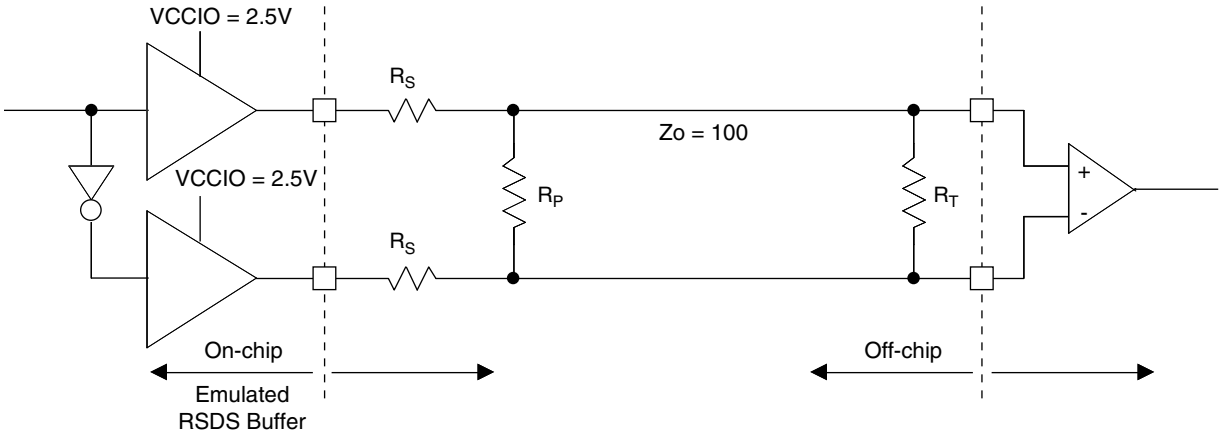

Table 3-4. RSDS DC Conditions

Parameter	Description	Typical	Units
Z_{OUT}	Output impedance	20	ohms
R_S	Driver series resistor	300	ohms
R_P	Driver parallel resistor	121	ohms
R_T	Receiver termination	100	ohms
V_{OH}	Output high voltage	1.35	V
V_{OL}	Output low voltage	1.15	V
V_{OD}	Output differential voltage	0.20	V
V_{CM}	Output common mode voltage	1.25	V
Z_{BACK}	Back impedance	101.5	ohms
I_{DC}	DC output current	3.66	mA

Timing v.F0.11

Signal Descriptions

Signal Name	I/O	Descriptions
General Purpose		
P[Edge] [Row/Column Number*]_[A/B]	I/O	[Edge] indicates the edge of the device on which the pad is located. Valid edge designations are L (Left), B (Bottom), R (Right), T (Top). [Row/Column Number] indicates the PFU row or the column of the device on which the PIC exists. When Edge is T (Top) or (Bottom), only need to specify Row Number. When Edge is L (Left) or R (Right), only need to specify Column Number. [A/B] indicates the PIO within the PIC to which the pad is connected. Some of these user programmable pins are shared with special function pins. These pin when not used as special purpose pins can be programmed as I/Os for user logic. During configuration, the user-programmable I/Os are tri-stated with an internal pull-up resistor enabled. If any pin is not used (or not bonded to a package pin), it is also tri-stated with an internal pull-up resistor enabled after configuration.
GSRN	I	Global RESET signal. (Active low). Any I/O pin can be configured to be GSRN.
NC	—	No connect.
GND	—	GND - Ground. Dedicated Pins.
V_{CC}	—	VCC - The power supply pins for core logic. Dedicated Pins.
V_{CCAUX}	—	V_{CCAUX} - The Auxiliary power supply pin. It powers all the differential and referenced input buffers. Dedicated Pins.
V_{CCP0}	—	Voltage supply pins for ULM0PLL (and LLM1PLL[1]).
V_{CCP1}	—	Voltage supply pins for URM0PLL (and LRM1PLL[1]).
GNDP0	—	Ground pins for ULM0PLL (and LLM1PLL[1]).
GNDP1	—	Ground pins for URM0PLL (and LRM1PLL[1]).
V_{CCIOx}	—	V_{CCIO} - The power supply pins for I/O bank x. Dedicated Pins.
$V_{REF1(x)}$, $V_{REF2(x)}$	—	Reference supply pins for I/O bank x. Pre-determined pins in each bank are assigned as V_{REF} inputs. When not used, they may be used as I/O pins.
PLL and Clock Functions (Used as user programmable I/O pins when not in use for PLL or clock pins)		
[LOC][num]_PLL[T, C]_IN_A	—	Reference clock (PLL) input Pads: ULM, LLM, URM, LRM, num = row from center, T = true and C = complement, index A, B, C...at each side.
[LOC][num]_PLL[T, C]_FB_A	—	Optional feedback (PLL) input Pads: ULM, LLM, URM, LRM, num = row from center, T = true and C = complement, index A, B, C...at each side.
PCLK[T, C]_[n:0]_[3:0]	—	Primary Clock Pads, T = true and C = complement, n per side, indexed by bank and 0,1, 2, 3 within bank.
[LOC]DQS[num]	—	DQS input Pads: T (Top), R (Right), B (Bottom), L (Left), DQS, num = Ball function number. Any pad can be configured to be DQS output.

Date	Version	Section	Change Summary
September 2005 (cont.)	03.0 (cont.)	DC and Switching Characteristics (cont.)	Updated Typical Building Block Function Performance timing numbers.
			Updated External Switching Characteristics timing numbers.
			Updated Internal Timing Parameters.
			Updated LatticeXP Family timing adders.
			Updated LatticeXP "C" Sleep Mode timing numbers.
			Updated JTAG Port Timing numbers.
		Pinout Information	Added clarification to SLEEPN and TOE description.
			Clarification of dedicated LVDS outputs.
		Supplemental Information	Updated list of technical notes.
September 2005	03.1	Pinout Information	Power Supply and NC Connections table corrected VCCP1 pin number for 208 PQFP.
December 2005	04.0	Introduction	Moved data sheet from Advance to Final.
		Architecture	Added clarification to Typical I/O Behavior During Power-up section.
		DC and Switching Characteristics	Added clarification to Recommended Operating Conditions.
			Updated timing numbers.
		Pinout Information	Updated Signal Descriptions table.
			Added clarification to Differential I/O Per Bank.
			Updated Differential dedicated LVDS output support.
		Ordering Information	Added 208 PQFP lead-free package and ordering part numbers.
February 2006	04.1	Pinout Information	Corrected description of Signal Names VREF1(x) and VREF2(x).
March 2006	04.2	DC and Switching Characteristics	Corrected condition for IIL and IIH.
March 2006	04.3	DC and Switching Characteristics	Added clarification to Recommended Operating Conditions for VCCAUX.
April 2006	04.4	Pinout Information	Removed Bank designator "5" from SLEEPN/TOE ball function.
May 2006	04.5	DC and Switching Characteristics	Added footnote 2 regarding threshold level for PROGRAMN to sysCONFIG Port Timing Specifications table.
June 2006	04.6	DC and Switching Characteristics	Corrected LVDS25E Output Termination Example.
August 2006	04.7	Architecture	Added clarification to Typical I/O Behavior During Power-Up section.
			Added clarification to Left and Right sysIO Buffer Pair section.
		DC and Switching Characteristics	Changes to LVDS25E Output Termination Example diagram.
December 2006	04.8	Architecture	EBR Asynchronous Reset section added.
February 2007	04.9	Architecture	Updated EBR Asynchronous Reset section.
July 2007	05.0	Introduction	Updated LatticeXP Family Selection Guide table.
		Architecture	Updated Typical I/O Behavior During Power-up text section.
		DC and Switching Characteristics	Updated sysIO Single-Ended DC Electrical Characteristics table. Split out LVCMOS 1.2 by supply voltage.
November 2007	05.1	DC and Switching Characteristics	Added JTAG Port Timing Waveforms diagram.
		Pinout Information	Added Thermal Management text section.
		Supplemental Information	Updated title list.
