## Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

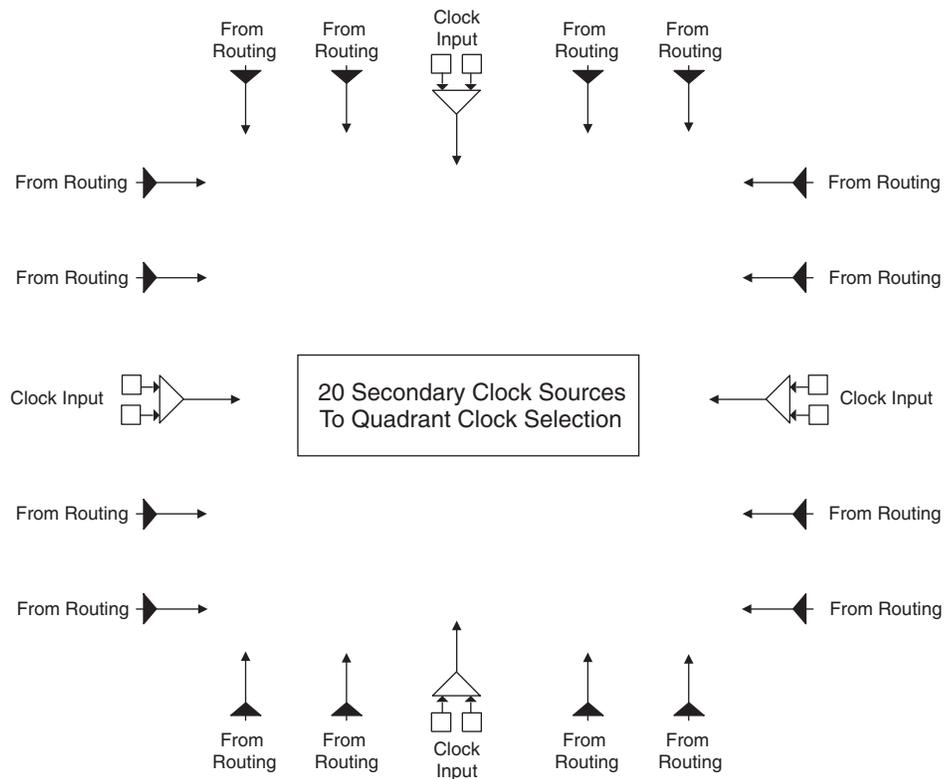

## Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

### Details

Product Status	Obsolete
Number of LABs/CLBs	-
Number of Logic Elements/Cells	10000
Total RAM Bits	221184
Number of I/O	188
Number of Gates	-
Voltage - Supply	1.71V ~ 3.465V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	256-BGA
Supplier Device Package	256-FPBGA (17x17)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/lattice-semiconductor/lfxp10c-4fn256i">https://www.e-xfl.com/product-detail/lattice-semiconductor/lfxp10c-4fn256i</a>

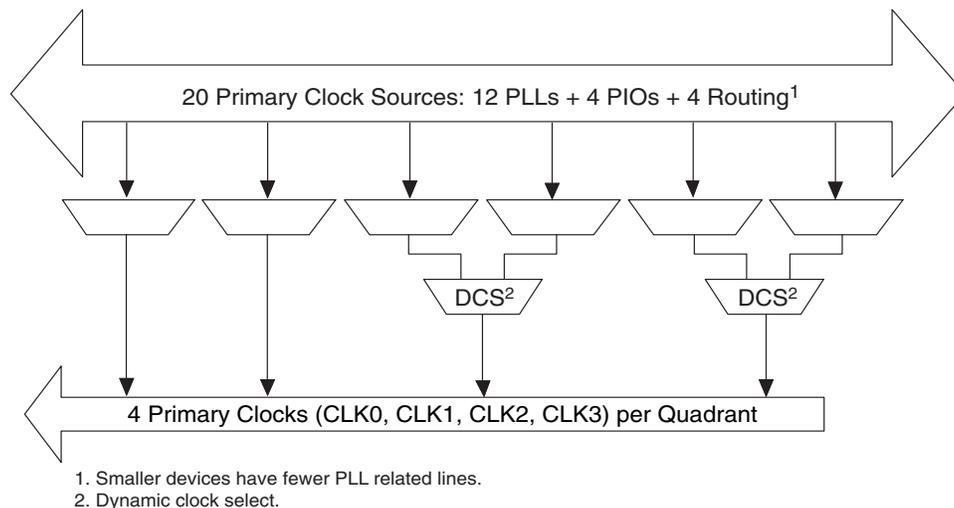

Figure 2-6. Secondary Clock Sources

### Clock Routing

The clock routing structure in LatticeXP devices consists of four Primary Clock lines and a Secondary Clock network per quadrant. The primary clocks are generated from MUXs located in each quadrant. Figure 2-7 shows this clock routing. The four secondary clocks are generated from MUXs located in each quadrant as shown in Figure 2-8. Each slice derives its clock from the primary clock lines, secondary clock lines and routing as shown in Figure 2-9.

Figure 2-7. Per Quadrant Primary Clock Selection

For more information on the PLL, please see details of additional technical documentation at the end of this data sheet.

## Dynamic Clock Select (DCS)

The DCS is a global clock buffer with smart multiplexer functions. It takes two independent input clock sources and outputs a clock signal without any glitches or runt pulses. This is achieved irrespective of where the select signal is toggled. There are eight DCS blocks per device, located in pairs at the center of each side. Figure 2-12 illustrates the DCS Block Macro.

**Figure 2-12. DCS Block Primitive**

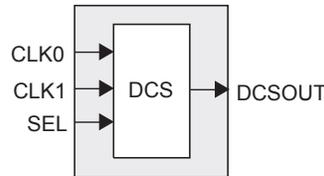

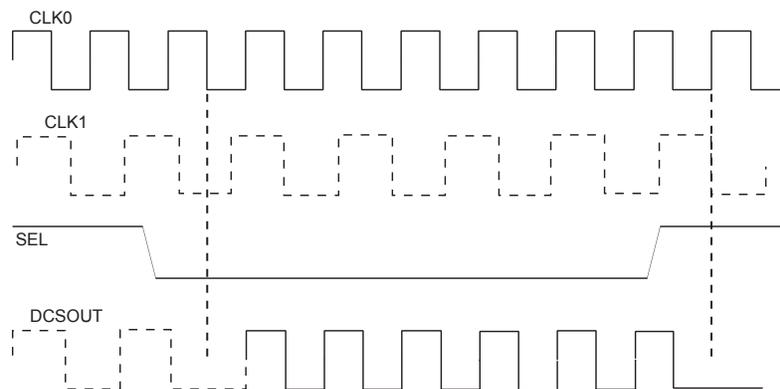

Figure 2-13 shows timing waveforms of the default DCS operating mode. The DCS block can be programmed to other modes. For more information on the DCS, please see details of additional technical documentation at the end of this data sheet.

**Figure 2-13. DCS Waveforms**

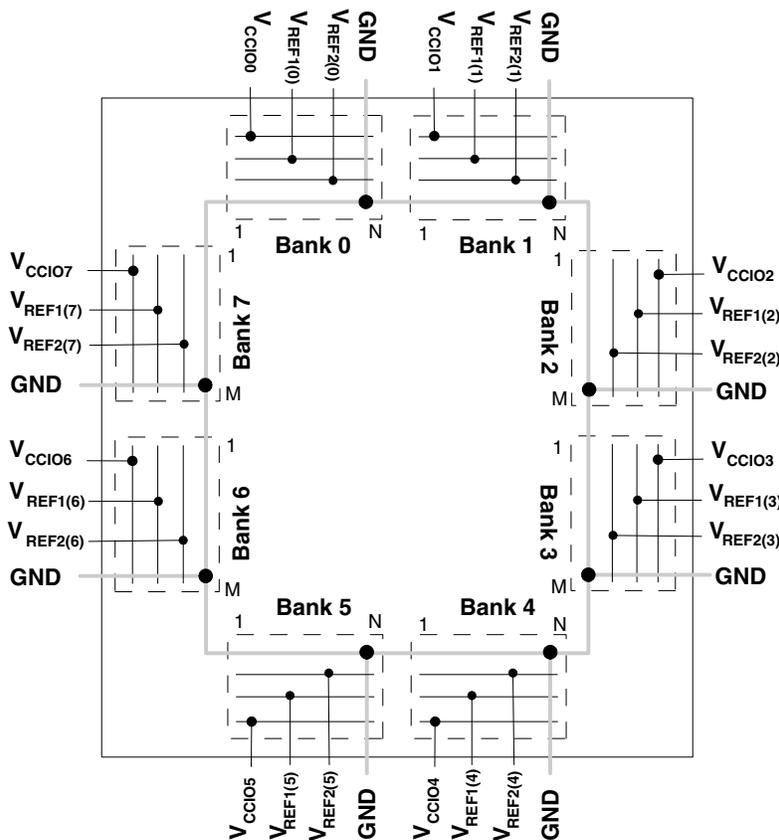

## sysMEM Memory

The LatticeXP family of devices contain a number of sysMEM Embedded Block RAM (EBR). The EBR consists of a 9-Kbit RAM, with dedicated input and output registers.

### sysMEM Memory Block

The sysMEM block can implement single port, dual port or pseudo dual port memories. Each block can be used in a variety of depths and widths as shown in Table 2-6.

Figure 2-28. LatticeXP Banks

Note: N and M are the maximum number of I/Os per bank.

LatticeXP devices contain two types of sysIO buffer pairs.

1. **Top and Bottom sysIO Buffer Pair (Single-Ended Outputs Only)**

The sysIO buffer pairs in the top and bottom banks of the device consist of two single-ended output drivers and two sets of single-ended input buffers (both ratioed and referenced). The referenced input buffer can also be configured as a differential input.

The two pads in the pair are described as “true” and “comp”, where the true pad is associated with the positive side of the differential input buffer and the comp (complementary) pad is associated with the negative side of the differential input buffer.

Only the I/Os on the top and bottom banks have PCI clamps. Note that the PCI clamp is enabled after  $V_{CC}$ ,  $V_{CCAUX}$  and  $V_{CCIO}$  are at valid operating levels and the device has been configured.

2. **Left and Right sysIO Buffer Pair (Differential and Single-Ended Outputs)**

The sysIO buffer pairs in the left and right banks of the device consist of two single-ended output drivers, two sets of single-ended input buffers (both ratioed and referenced) and one differential output driver. The referenced input buffer can also be configured as a differential input. In these banks the two pads in the pair are described as “true” and “comp”, where the true pad is associated with the positive side of the differential I/O, and the comp (complementary) pad is associated with the negative side of the differential I/O.

Select I/Os in the left and right banks have LVDS differential output drivers. Refer to the Logic Signal Connections tables for more information.

**Programming and Erase Flash Supply Current<sup>1, 2, 3, 4, 5</sup>**

Symbol	Parameter	Device	Typ <sup>6</sup>	Units
I <sub>CC</sub>	Core Power Supply	LFXP3E	30	mA
		LFXP6E	40	mA
		LFXP10E	50	mA
		LFXP15E	60	mA
		LFXP20E	70	mA
		LFXP3C	50	mA
		LFXP6C	60	mA
		LFXP10C	90	mA
		LFXP15C	100	mA
		LFXP20C	110	mA
I <sub>CCAUX</sub>	Auxiliary Power Supply V <sub>CCAUX</sub> = 3.3V	LFXP3E/C	50	mA
		LFXP6E/C	60	mA
		LFXP10E/C	90	mA
		LFXP15E/C	110	mA
		LFXP20E/C	130	mA
I <sub>CCJ</sub>	V <sub>CCJ</sub> Power Supply <sup>7</sup>	All	2	mA

1. For further information on supply current, please see details of additional technical documentation at the end of this data sheet.
2. Assumes all outputs are tristated, all inputs are configured as LVCMOS and held at the V<sub>CCIO</sub> or GND.
3. Blank user pattern; typical Flash pattern.
4. Bypass or decoupling capacitor across the supply.
5. JTAG programming is at 1MHz.
6. T<sub>A</sub>=25°C, power supplies at nominal voltage.
7. When programming via JTAG.

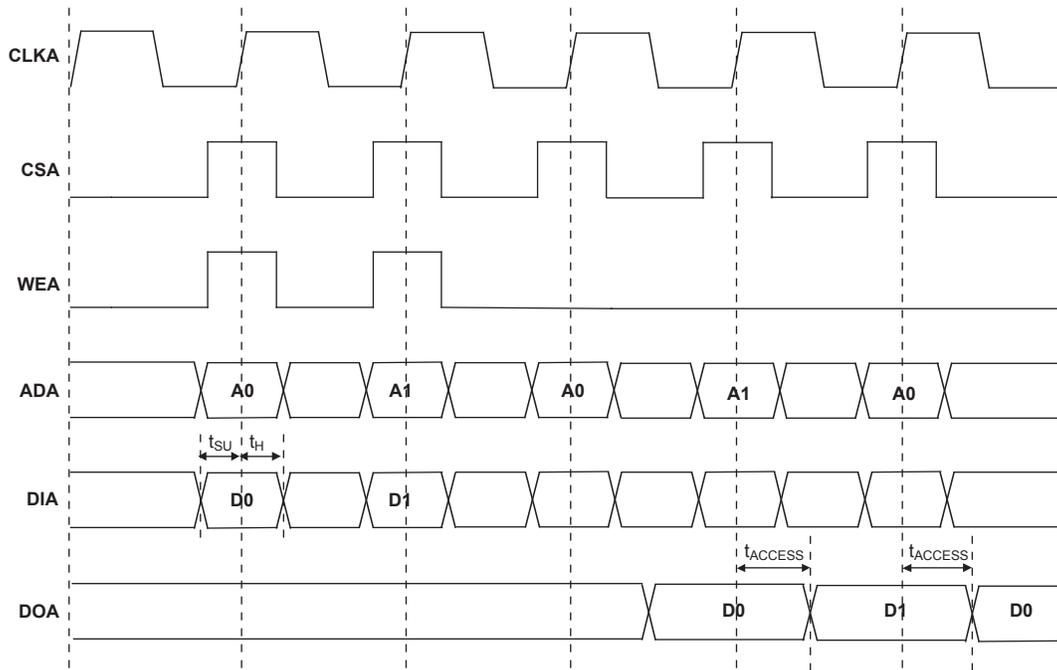

---

## Derating Logic Timing

Logic timing provided in the following sections of this data sheet and in the ispLEVER design tools are worst case numbers in the operating range. Actual delays at nominal temperature and voltage for best-case process can be much better than the values given in the tables. The ispLEVER design tool from Lattice can provide logic timing numbers at a particular temperature and voltage.

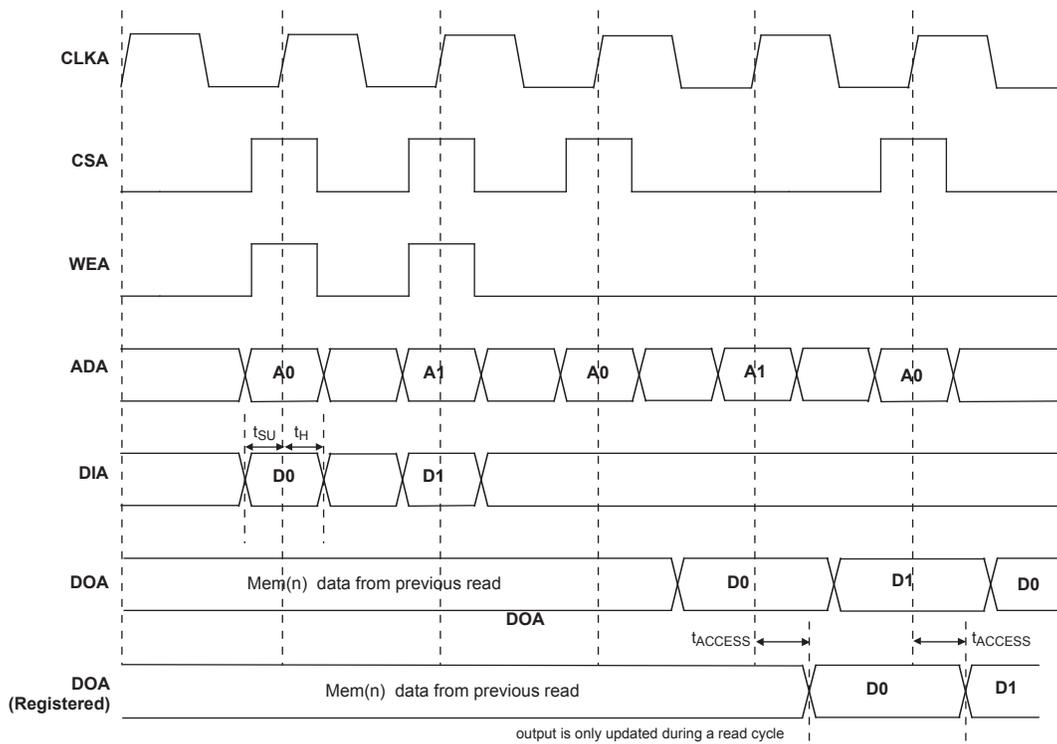

## EBR Memory Timing Diagrams

Figure 3-8. Read Mode (Normal)

Note: Input data and address are registered at the positive edge of the clock and output data appears after the positive of the clock.

Figure 3-9. Read Mode with Input and Output Registers
