Welcome to [E-XFL.COM](#)**Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)**

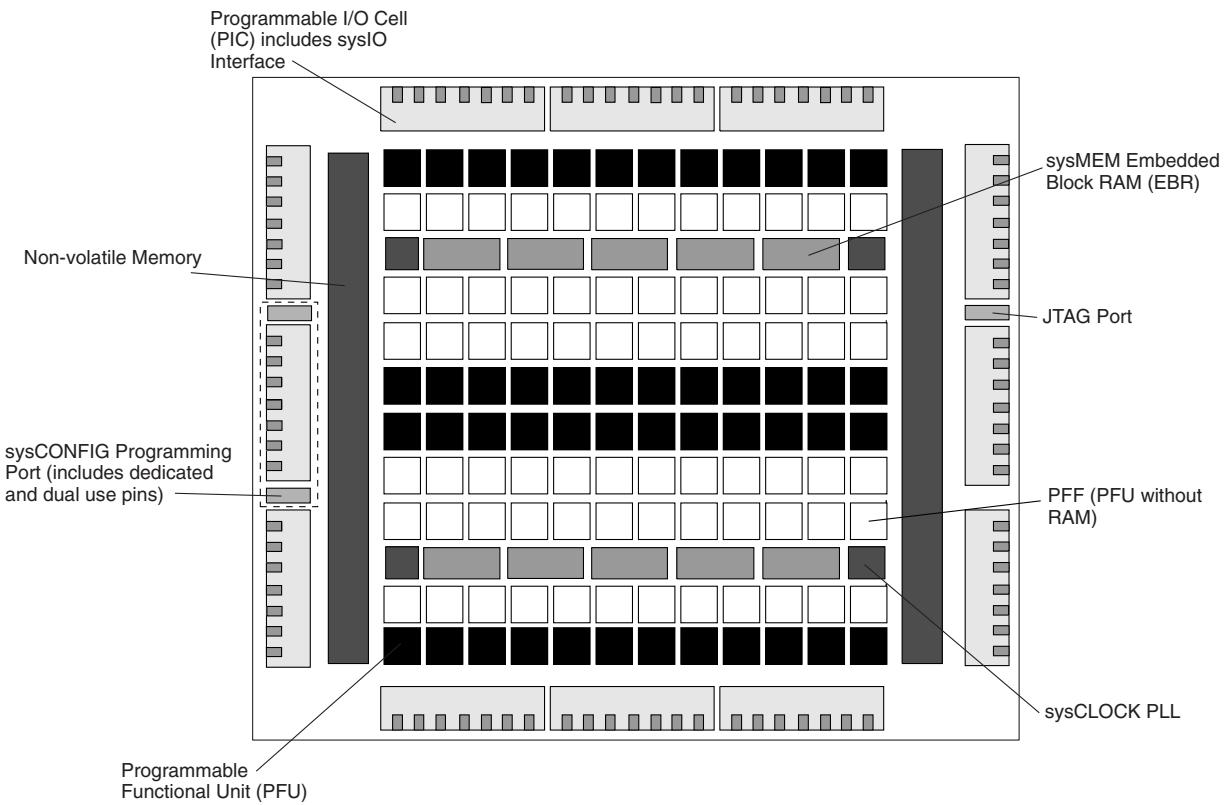

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details

Product Status	Obsolete
Number of LABs/CLBs	-
Number of Logic Elements/Cells	10000
Total RAM Bits	221184
Number of I/O	244
Number of Gates	-
Voltage - Supply	1.14V ~ 1.26V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	388-BBGA
Supplier Device Package	388-FPBGA (23x23)
Purchase URL	https://www.e-xfl.com/product-detail/lattice-semiconductor/lfxp10e-4fn388c

Figure 2-1. LatticeXP Top Level Block Diagram

PFU and PFF Blocks

The core of the LatticeXP devices consists of PFU and PFF blocks. The PFUs can be programmed to perform Logic, Arithmetic, Distributed RAM and Distributed ROM functions. PFF blocks can be programmed to perform Logic, Arithmetic and ROM functions. Except where necessary, the remainder of the data sheet will use the term PFU to refer to both PFU and PFF blocks.

Each PFU block consists of four interconnected slices, numbered 0-3 as shown in Figure 2-2. All the interconnections to and from PFU blocks are from routing. There are 53 inputs and 25 outputs associated with each PFU block.

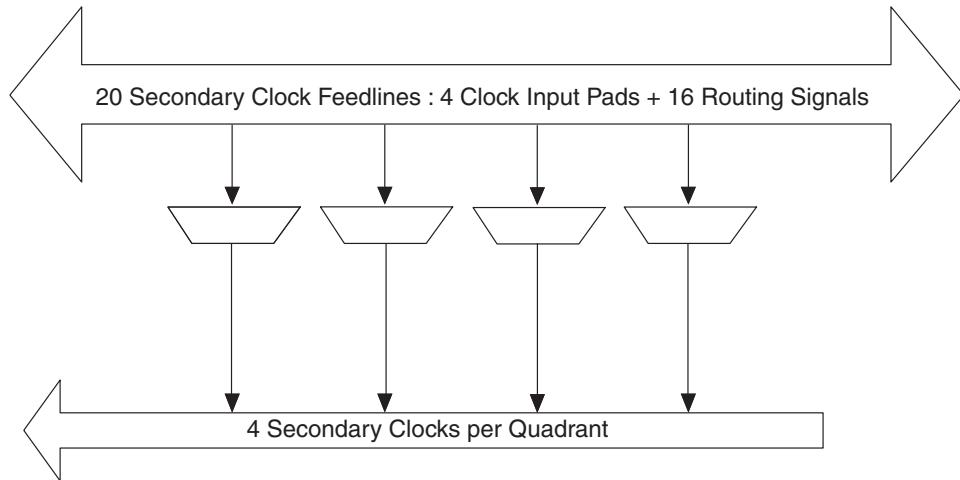

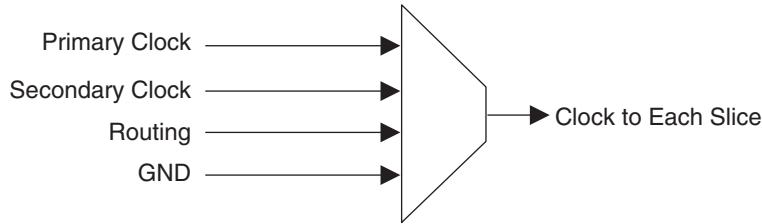

Figure 2-2. PFU Diagram

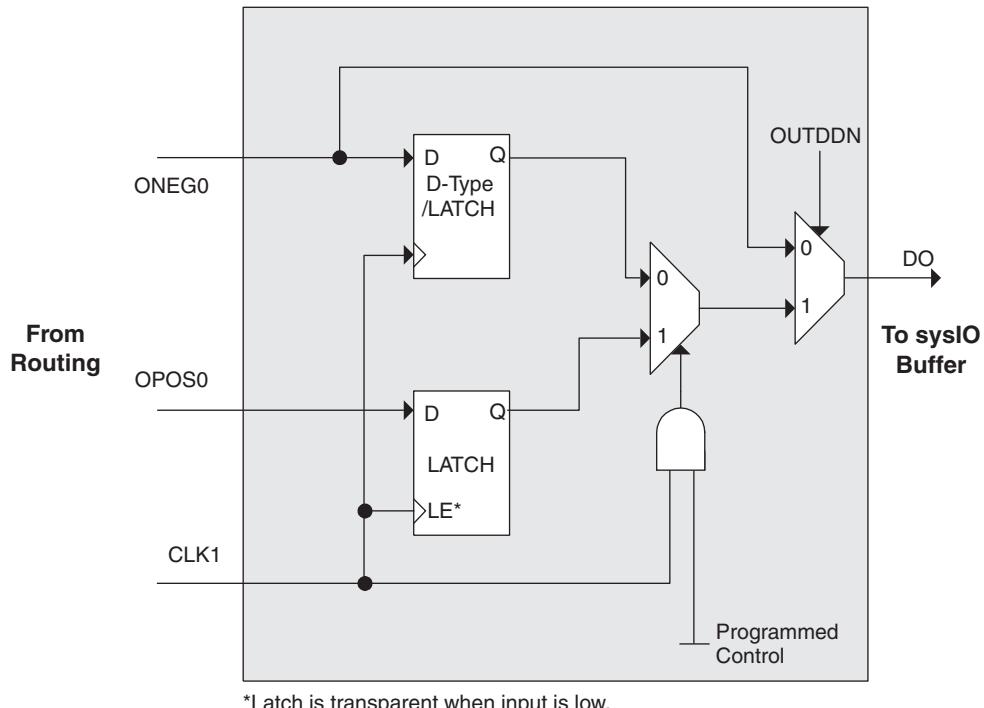

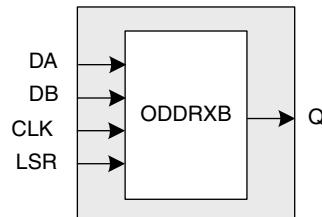

Figure 2-8. Per Quadrant Secondary Clock Selection**Figure 2-9. Slice Clock Selection**

sysCLOCK Phase Locked Loops (PLLs)

The PLL clock input, from pin or routing, feeds into an input clock divider. There are three sources of feedback signals to the feedback divider: from CLKOP (PLL internal), from clock net (CLKOP or CLKOS) or from a user clock (PIN or logic). There is a PLL_LOCK signal to indicate that VCO has locked on to the input clock signal. Figure 2-10 shows the sysCLOCK PLL diagram.

The setup and hold times of the device can be improved by programming a delay in the feedback or input path of the PLL which will advance or delay the output clock with reference to the input clock. This delay can be either programmed during configuration or can be adjusted dynamically. In dynamic mode, the PLL may lose lock after adjustment and not relock until the t_{LOCK} parameter has been satisfied. Additionally, the phase and duty cycle block allows the user to adjust the phase and duty cycle of the CLKOS output.

The sysCLOCK PLLs provide the ability to synthesize clock frequencies. Each PLL has four dividers associated with it: input clock divider, feedback divider, post scalar divider and secondary clock divider. The input clock divider is used to divide the input clock signal, while the feedback divider is used to multiply the input clock signal. The post scalar divider allows the VCO to operate at higher frequencies than the clock output, thereby increasing the frequency range. The secondary divider is used to derive lower frequency outputs.

Figure 2-23. Output Register Block**Figure 2-24. ODDRXB Primitive****Tristate Register Block**

The tristate register block provides the ability to register tri-state control signals from the core of the device before they are passed to the sysIO buffers. The block contains a register for SDR operation and an additional latch for DDR operation. Figure 2-25 shows the diagram of the Tristate Register Block.

In SDR mode, ONEG1 feeds one of the flip-flops that then feeds the output. The flip-flop can be configured a D-type or latch. In DDR mode, ONEG1 is fed into one register on the positive edge of the clock and OPOS1 is latched. A multiplexer running off the same clock selects the correct register for feeding to the output (D0).

Table 2-9. Characteristics of Normal, Off and Sleep Modes

Characteristic	Normal	Off	Sleep
SLEEPN Pin	High	—	Low
Static I _{cc}	Typical <100mA	0	Typical <100uA
I/O Leakage	<10μA	<1mA	<10μA
Power Supplies V _{CC} /V _{CCIO} /V _{CCAUX}	Normal Range	Off	Normal Range
Logic Operation	User Defined	Non Operational	Non operational
I/O Operation	User Defined	Tri-state	Tri-state
JTAG and Programming circuitry	Operational	Non-operational	Non-operational
EBR Contents and Registers	Maintained	Non-maintained	Non-maintained

SLEEPN Pin Characteristics

The SLEEPN pin behaves as an LVCMOS input with the voltage standard appropriate to the V_{CC} supply for the device. This pin also has a weak pull-up typically in the order of 10μA along with a Schmidt trigger and glitch filter to prevent false triggering. An external pull-up to V_{CC} is recommended when Sleep Mode is not used to ensure the device stays in normal operation mode. Typically the device enters Sleep Mode several hundred ns after SLEEPN is held at a valid low and restarts normal operation as specified in the Sleep Mode Timing table. The AC and DC specifications portion of this data sheet show a detailed timing diagram.

Configuration and Testing

The following section describes the configuration and testing features of the LatticeXP family of devices.

IEEE 1149.1-Compliant Boundary Scan Testability

All LatticeXP devices have boundary scan cells that are accessed through an IEEE 1149.1 compliant test access port (TAP). This allows functional testing of the circuit board, on which the device is mounted, through a serial scan path that can access all critical logic nodes. Internal registers are linked internally, allowing test data to be shifted in and loaded directly onto test nodes, or test data to be captured and shifted out for verification. The test access port consists of dedicated I/Os: TDI, TDO, TCK and TMS. The test access port has its own supply voltage V_{CCJ} and can operate with LVCMOS3.3, 2.5, 1.8, 1.5 and 1.2 standards.

For more details on boundary scan test, please see information regarding additional technical documentation at the end of this data sheet.

Device Configuration

All LatticeXP devices contain two possible ports that can be used for device configuration and programming. The test access port (TAP), which supports serial configuration, and the sysCONFIG port that supports both byte-wide and serial configuration.

The non-volatile memory in the LatticeXP can be configured in three different modes:

- In sysCONFIG mode via the sysCONFIG port. Note this can also be done in background mode.
- In 1532 mode via the 1149.1 port.
- In background mode via the 1149.1 port. This allows the device to be operated while reprogramming takes place.

The SRAM configuration memory can be configured in three different ways:

- At power-up via the on-chip non-volatile memory.
- In 1532 mode via the 1149.1 port SRAM direct configuration.
- In sysCONFIG mode via the sysCONFIG port SRAM direct configuration.

Programming and Erase Flash Supply Current^{1, 2, 3, 4, 5}

Symbol	Parameter	Device	Typ ⁶	Units
I_{CC}	Core Power Supply	LFXP3E	30	mA
		LFXP6E	40	mA
		LFXP10E	50	mA
		LFXP15E	60	mA
		LFXP20E	70	mA
		LFXP3C	50	mA
		LFXP6C	60	mA
		LFXP10C	90	mA
		LFXP15C	100	mA
		LFXP20C	110	mA
I_{CCAUX}	Auxiliary Power Supply $V_{CCAUX} = 3.3V$	LFXP3E/C	50	mA
		LFXP6E/C	60	mA
		LFXP10E/C	90	mA
		LFXP15E/C	110	mA
		LFXP20E/C	130	mA
I_{CCJ}	V_{CCJ} Power Supply ⁷	All	2	mA

1. For further information on supply current, please see details of additional technical documentation at the end of this data sheet.
2. Assumes all outputs are tristated, all inputs are configured as LVC MOS and held at the V_{CCIO} or GND.
3. Blank user pattern; typical Flash pattern.
4. Bypass or decoupling capacitor across the supply.
5. JTAG programming is at 1MHz.
6. $T_A=25^\circ C$, power supplies at nominal voltage.
7. When programming via JTAG.

Timing v.F0.11

Signal Descriptions (Cont.)

Signal Name	I/O	Descriptions
Test and Programming (Dedicated pins. Pull-up is enabled on input pins during configuration.)		
TMS	I	Test Mode Select input, used to control the 1149.1 state machine.
TCK	I	Test Clock input pin, used to clock the 1149.1 state machine.
TDI	I	Test Data in pin, used to load data into device using 1149.1 state machine. After power-up, this TAP port can be activated for configuration by sending appropriate command. (Note: once a configuration port is selected it is locked. Another configuration port cannot be selected until the power-up sequence).
TDO	O	Output pin -Test Data out pin used to shift data out of device using 1149.1.
V _{CCJ}	—	V _{CCJ} - The power supply pin for JTAG Test Access Port.
Configuration Pads (used during sysCONFIG)		
CFG[1:0]	I	Mode pins used to specify configuration modes values latched on rising edge of INITN. During configuration, a pull-up is enabled.
INITN	I/O	Open Drain pin - Indicates the FPGA is ready to be configured. During configuration, a pull-up is enabled. If CFG1 and CFG0 are high (SDM) then this pin is pulled low.
PROGRAMN	I	Initiates configuration sequence when asserted low. This pin always has an active pull-up.
DONE	I/O	Open Drain pin - Indicates that the configuration sequence is complete, and the startup sequence is in progress.
CCLK	I/O	Configuration Clock for configuring an FPGA in sysCONFIG mode.
BUSY	I/O	Generally not used. After configuration it is a user-programmable I/O pin.
CSN	I	sysCONFIG chip select (Active low). During configuration, a pull-up is enabled. After configuration it is user a programmable I/O pin.
CS1N	I	sysCONFIG chip select (Active Low). During configuration, a pull-up is enabled. After configuration it is user programmable I/O pin
WRITEN	I	Write Data on Parallel port (Active low). After configuration it is a user programmable I/O pin
D[7:0]	I/O	sysCONFIG Port Data I/O. After configuration these are user programmable I/O pins.
DOUT, CSON	O	Output for serial configuration data (rising edge of CCLK) when using sysCONFIG port. After configuration, it is a user-programmable I/O pin.
DI	I	Input for serial configuration data (clocked with CCLK) when using sysCONFIG port. During configuration, a pull-up is enabled. After configuration it is a user-programmable I/O pin.
SLEEPN ²	I	Sleep Mode pin - Active low sleep pin. ^b When this pin is held high, the device operates normally. ^b When driven low, the device moves into Sleep Mode after a specified time. This pin has a weak internal pull-up, but when not used an external pull-up to V _{CC} is recommended.
TOE ³	I	Test Output Enable tri-states all I/O pins when driven low. This pin has a weak internal pull-up, but when not used an external pull-up to V _{CC} is recommended.

1. Applies to LFXP10, LFXP15 and LFXP20 only.

2. Applies to LFXP "C" devices only.

3. Applies to LFXP "E" devices only.

- During configuration the user-programmable I/Os are tri-stated with an internal pull-up resistor enabled. If any pin is not used (or not bonded to a package pin), it is also tri-stated with an internal pull-up resistor enabled after configuration.
- The differential I/O per bank includes both dedicated LVDS and emulated LVDS pin pairs. Please see the Logic Signal Connections table for more information.
