

Welcome to [E-XFL.COM](#)

Understanding Embedded - FPGAs (Field Programmable Gate Array)

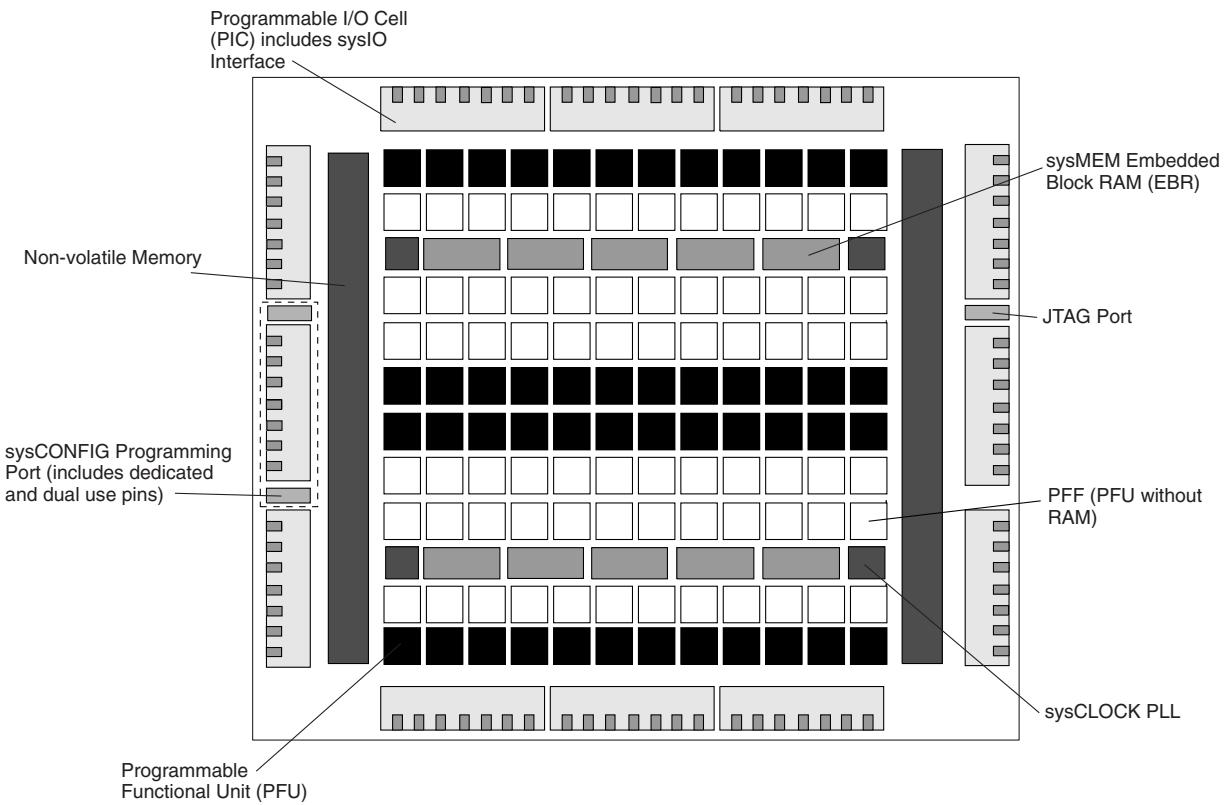

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details

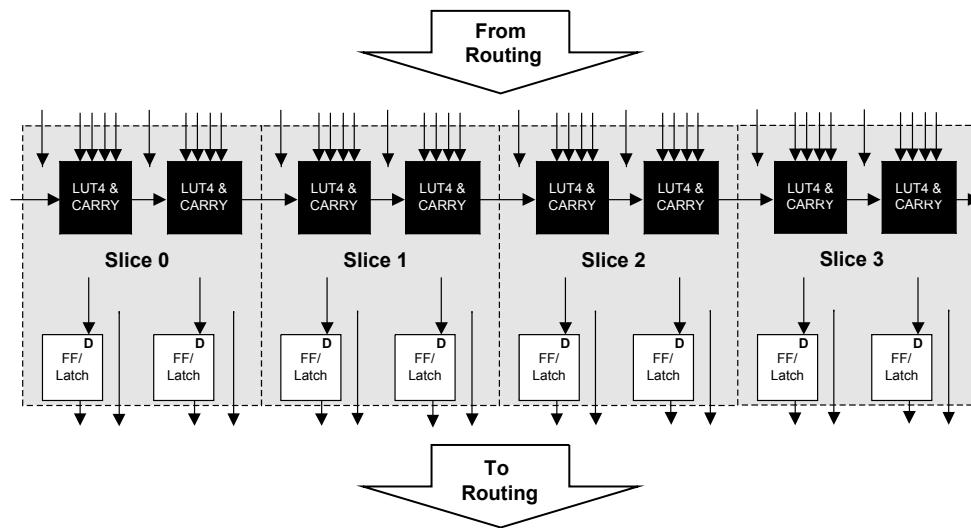

Product Status	Obsolete
Number of LABs/CLBs	-
Number of Logic Elements/Cells	15000
Total RAM Bits	331776
Number of I/O	300
Number of Gates	-
Voltage - Supply	1.71V ~ 3.465V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	484-BBGA
Supplier Device Package	484-FPBGA (23x23)
Purchase URL	https://www.e-xfl.com/product-detail/lattice-semiconductor/lfxp15c-4fn484c

Figure 2-1. LatticeXP Top Level Block Diagram

PFU and PFF Blocks

The core of the LatticeXP devices consists of PFU and PFF blocks. The PFUs can be programmed to perform Logic, Arithmetic, Distributed RAM and Distributed ROM functions. PFF blocks can be programmed to perform Logic, Arithmetic and ROM functions. Except where necessary, the remainder of the data sheet will use the term PFU to refer to both PFU and PFF blocks.

Each PFU block consists of four interconnected slices, numbered 0-3 as shown in Figure 2-2. All the interconnections to and from PFU blocks are from routing. There are 53 inputs and 25 outputs associated with each PFU block.

Figure 2-2. PFU Diagram

in selected blocks the input to the DQS delay block. If one of the bypass options is not chosen, the signal first passes through an optional delay block. This delay, if selected, ensures no positive input-register hold-time requirement when using a global clock.

The input block allows two modes of operation. In the single data rate (SDR) the data is registered, by one of the registers in the single data rate sync register block, with the system clock. In the DDR Mode two registers are used to sample the data on the positive and negative edges of the DQS signal creating two data streams, D0 and D2. These two data streams are synchronized with the system clock before entering the core. Further discussion on this topic is in the DDR Memory section of this data sheet.

Figure 2-21 shows the input register waveforms for DDR operation and Figure 2-22 shows the design tool primitives. The SDR/SYNC registers have reset and clock enable available.

The signal DDRCLKPOL controls the polarity of the clock used in the synchronization registers. It ensures adequate timing when data is transferred from the DQS to the system clock domain. For further discussion of this topic, see the DDR memory section of this data sheet.

Figure 2-20. Input Register Diagram

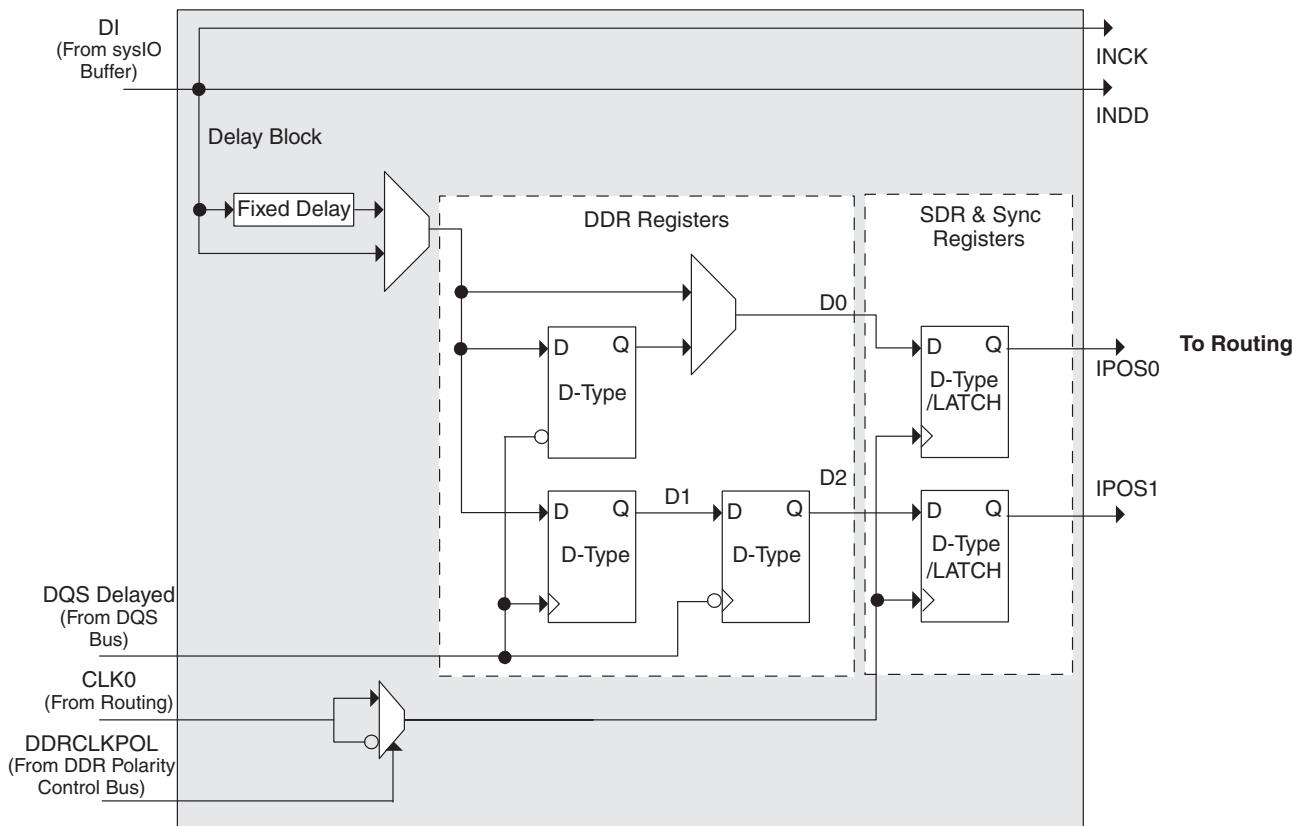

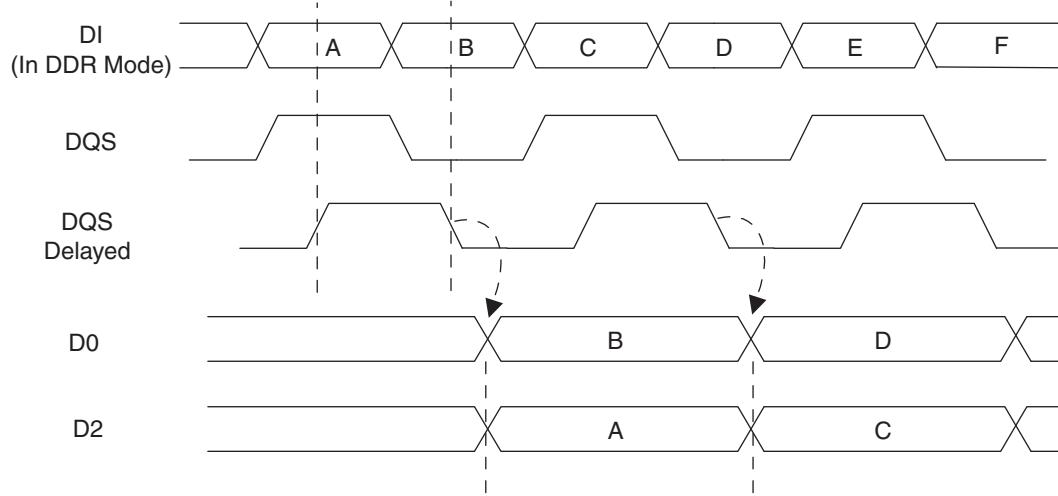

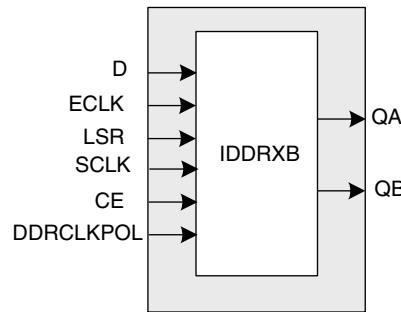

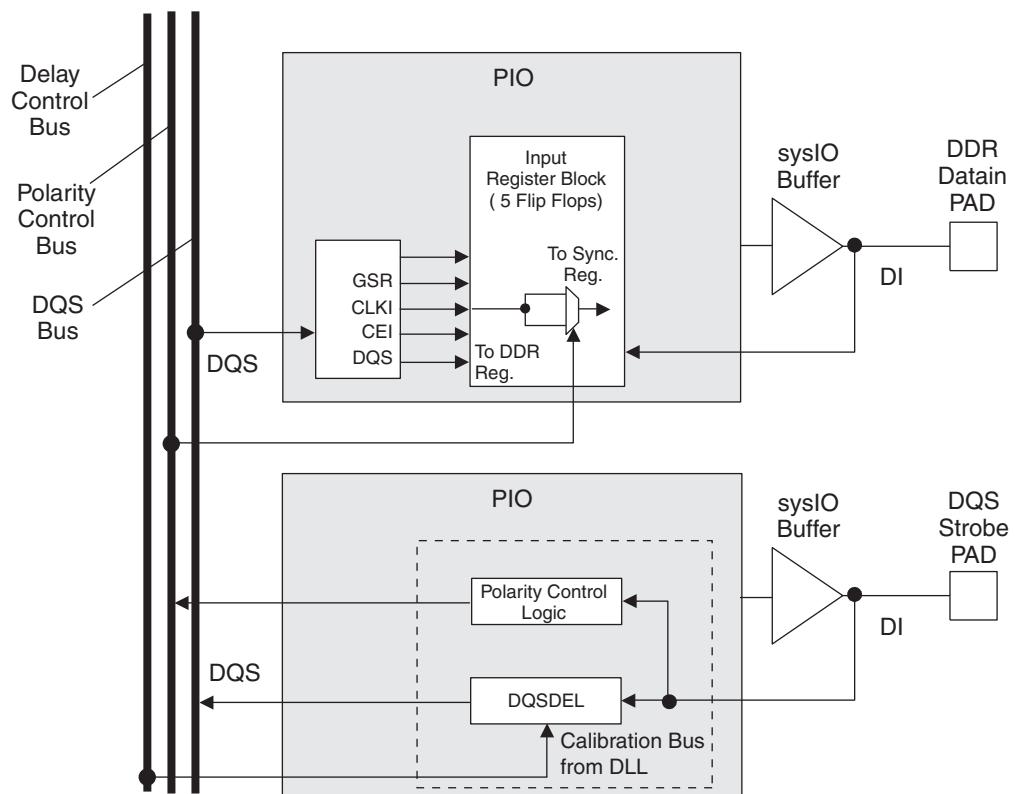

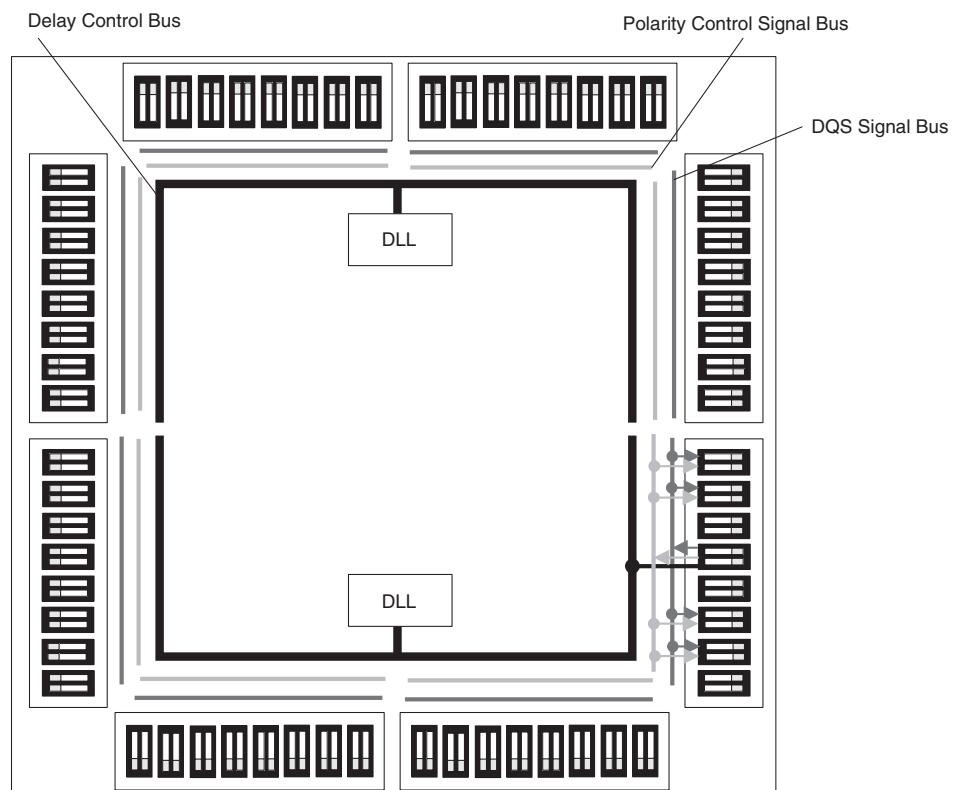

Figure 2-21. Input Register DDR Waveforms**Figure 2-22. INDDRXB Primitive**

Output Register Block

The output register block provides the ability to register signals from the core of the device before they are passed to the sysIO buffers. The block contains a register for SDR operation that is combined with an additional latch for DDR operation. Figure 2-23 shows the diagram of the Output Register Block.

In SDR mode, ONEG0 feeds one of the flip-flops that then feeds the output. The flip-flop can be configured as a D-type or as a latch. In DDR mode, ONEG0 is fed into one register on the positive edge of the clock and OPOS0 is latched. A multiplexer running off the same clock selects the correct register for feeding to the output (D0).

Figure 2-24 shows the design tool DDR primitives. The SDR output register has reset and clock enable available. The additional register for DDR operation does not have reset or clock enable available.

Figure 2-26. DQS Local Bus**Figure 2-27. DLL Calibration Bus and DQS/DQS Transition Distribution**

Polarity Control Logic

In a typical DDR Memory interface design, the phase relation between the incoming delayed DQS strobe and the internal system Clock (during the READ cycle) is unknown.

The LatticeXP family contains dedicated circuits to transfer data between these domains. To prevent setup and hold violations at the domain transfer between DQS (delayed) and the system Clock a clock polarity selector is used. This changes the edge on which the data is registered in the synchronizing registers in the input register block. This requires evaluation at the start of the each READ cycle for the correct clock polarity.

Prior to the READ operation in DDR memories DQS is in tristate (pulled by termination). The DDR memory device drives DQS low at the start of the preamble state. A dedicated circuit detects this transition. This signal is used to control the polarity of the clock to the synchronizing registers.

sysIO Buffer

Each I/O is associated with a flexible buffer referred to as a sysIO buffer. These buffers are arranged around the periphery of the device in eight groups referred to as Banks. The sysIO buffers allow users to implement the wide variety of standards that are found in today's systems including LVCMOS, SSTL, HSTL, LVDS and LVPECL.

sysIO Buffer Banks

LatticeXP devices have eight sysIO buffer banks; each is capable of supporting multiple I/O standards. Each sysIO bank has its own I/O supply voltage (V_{CCIO}), and two voltage references V_{REF1} and V_{REF2} resources allowing each bank to be completely independent from each other. Figure 2-28 shows the eight banks and their associated supplies.

In the LatticeXP devices, single-ended output buffers and ratioed input buffers (LVTTL, LVCMOS, PCI and PCI-X) are powered using V_{CCIO} . LVTTL, LVCMOS33, LVCMOS25 and LVCMOS12 can also be set as a fixed threshold input independent of V_{CCIO} . In addition to the bank V_{CCIO} supplies, the LatticeXP devices have a V_{CC} core logic power supply, and a V_{CCAUX} supply that power all differential and referenced buffers.

Each bank can support up to two separate VREF voltages, VREF1 and VREF2 that set the threshold for the referenced input buffers. In the LatticeXP devices, a dedicated pin in a bank can be configured to be a reference voltage supply pin. Each I/O is individually configurable based on the bank's supply and reference voltages.

Figure 2-29 provides a pictorial representation of the different programming ports and modes available in the Lattice eXP devices.

On power-up, the FPGA SRAM is ready to be configured with the sysCONFIG port active. The IEEE 1149.1 serial mode can be activated any time after power-up by sending the appropriate command through the TAP port.

Leave Alone I/O

When using 1532 mode for non-volatile memory programming, users may specify I/Os as high, low, tristated or held at current value. This provides excellent flexibility for implementing systems where reprogramming occurs on-the-fly.

TransFR (Transparent Field Reconfiguration)

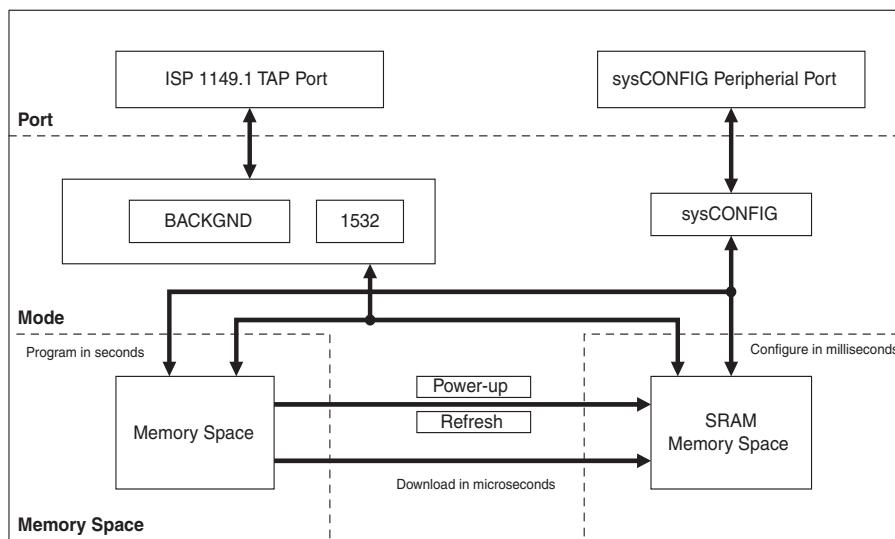

TransFR (TFR) is a unique Lattice technology that allows users to update their logic in the field without interrupting system operation using a single ispVM command. See Lattice technical note #TN1087, *Minimizing System Interruption During Configuration Using TransFR Technology*, for details.

Security

The LatticeXP devices contain security bits that, when set, prevent the readback of the SRAM configuration and non-volatile memory spaces. Once set, the only way to clear security bits is to erase the memory space.

For more information on device configuration, please see details of additional technical documentation at the end of this data sheet.

Figure 2-29. ispXP Block Diagram

Internal Logic Analyzer Capability (ispTRACY)

All LatticeXP devices support an internal logic analyzer diagnostic feature. The diagnostic features provide capabilities similar to an external logic analyzer, such as programmable event and trigger condition and deep trace memory. This feature is enabled by Lattice's ispTRACY. The ispTRACY utility is added into the user design at compile time.

For more information on ispTRACY, please see information regarding additional technical documentation at the end of this data sheet.

Oscillator

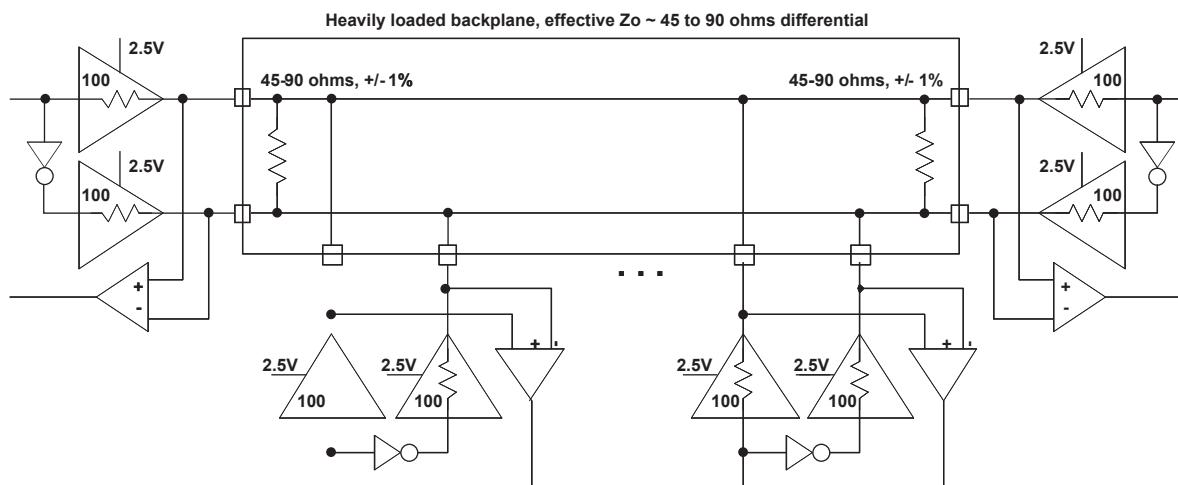

Every LatticeXP device has an internal CMOS oscillator which is used to derive a master serial clock for configuration. The oscillator and the master serial clock run continuously in the configuration mode. The default value of the

Initialization Supply Current^{1, 2, 3, 4, 5, 6}

Over Recommended Operating Conditions

Symbol	Parameter	Device	Typ. ⁷	Units

R_{TRIGHT}	Right end termination	45	90	ohms
V_{OH}	Output high voltage	1.375	1.48	V
V_{OL}	Output low voltage	1.125	1.02	V
V_{OD}	Output differential voltage	0.25	0.46	V
V_{CM}	Output common mode voltage	1.25	1.25	V
I_{DC}	DC output current	11.2	10.2	mA

1. For input buffer, see LVDS table.

LVPECL

The LatticeXP devices support differential LVPECL standard. This standard is emulated using complementary LVC MOS outputs in conjunction with a parallel resistor across the driver outputs. The LVPECL input standard is supported by the LVDS differential input buffer. The scheme shown in Figure 3-3 is one possible solution for point-to-point signals.

Figure 3-3. Differential LVPECL**Table 3-3. LVPECL DC Conditions¹****Over Recommended Operating Conditions**

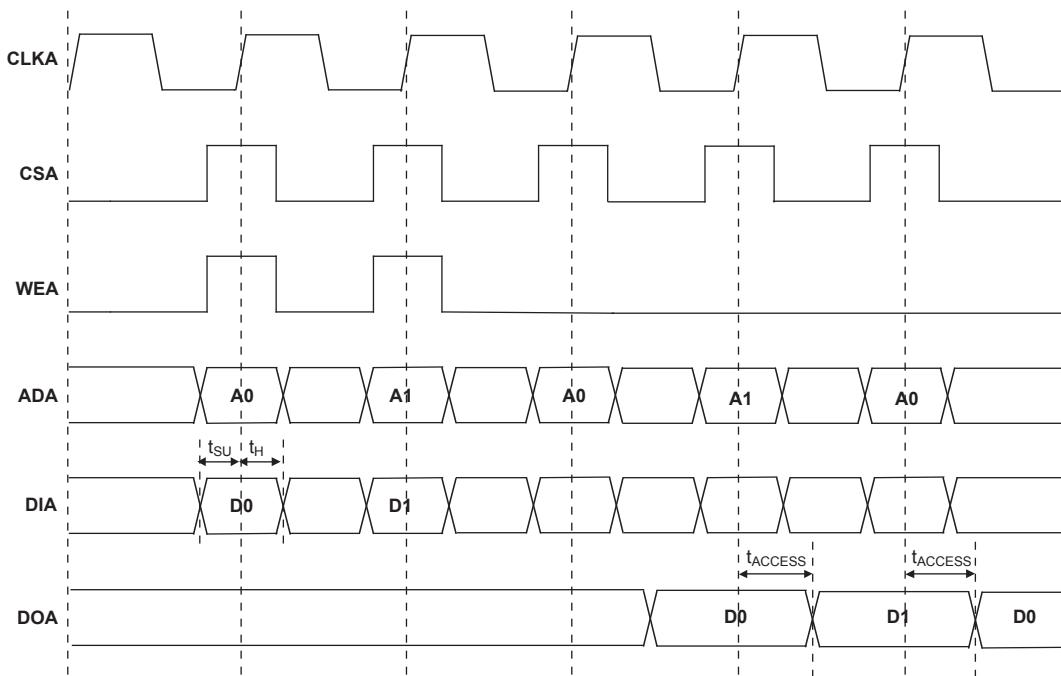

Symbol	Description	Typical	Units
Z_{OUT}	Output impedance	100	ohms
R_P	Driver parallel resistor	187	ohms
R_S	Driver series resistor	100	ohms
R_T	Receiver termination	100	ohms
V_{OH}	Output high voltage	2.03	V
V_{OL}	Output low voltage	1.27	V
V_{OD}	Output differential voltage	0.76	V
V_{CM}	Output common mode voltage	1.65	V
Z_{BACK}	Back impedance	85.7	ohms
I_{DC}	DC output current	12.7	mA

1. For input buffer, see LVDS table.

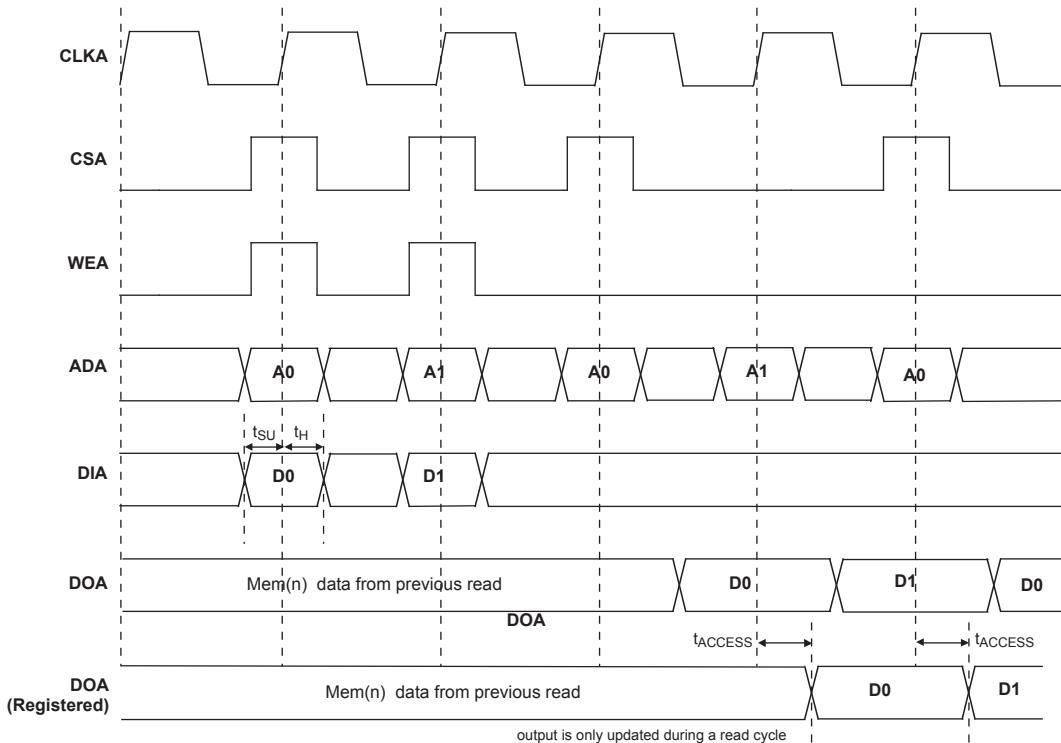

For further information on LVPECL, BLVDS and other differential interfaces please see details of additional technical documentation at the end of the data sheet.

RSDS

The LatticeXP devices support differential RSDS standard. This standard is emulated using complementary LVC MOS outputs in conjunction with a parallel resistor across the driver outputs. The RSDS input standard is supported by the LVDS differential input buffer. The scheme shown in Figure 3-4 is one possible solution for RSDS standard implementation. Use LVDS25E mode with suggested resistors for RSDS operation. Resistor values in Figure 3-4 are industry standard values for 1% resistors.

EBR Memory Timing Diagrams**Figure 3-8. Read Mode (Normal)**

Note: Input data and address are registered at the positive edge of the clock and output data appears after the positive of the clock.

Figure 3-9. Read Mode with Input and Output Registers

Signal Descriptions

Signal Name	I/O	Descriptions
General Purpose		
P[Edge] [Row/Column Number*]_[A/B]	I/O	<p>[Edge] indicates the edge of the device on which the pad is located. Valid edge designations are L (Left), B (Bottom), R (Right), T (Top).</p> <p>[Row/Column Number] indicates the PFU row or the column of the device on which the PIC exists. When Edge is T (Top) or (Bottom), only need to specify Row Number. When Edge is L (Left) or R (Right), only need to specify Column Number.</p> <p>[A/B] indicates the PIO within the PIC to which the pad is connected.</p> <p>Some of these user programmable pins are shared with special function pins. These pin when not used as special purpose pins can be programmed as I/Os for user logic.</p> <p>During configuration, the user-programmable I/Os are tri-stated with an internal pull-up resistor enabled. If any pin is not used (or not bonded to a package pin), it is also tri-stated with an internal pull-up resistor enabled after configuration.</p>
GSRN	I	Global RESET signal. (Active low). Any I/O pin can be configured to be GSRN.
NC	—	No connect.
GND	—	GND - Ground. Dedicated Pins.
V _{CC}	—	V _{CC} - The power supply pins for core logic. Dedicated Pins.
V _{CCAUX}	—	V _{CCAUX} - The Auxiliary power supply pin. It powers all the differential and referenced input buffers. Dedicated Pins.
V _{CCP0}	—	Voltage supply pins for ULM0PLL (and LLM1PLL ¹).
V _{CCP1}	—	Voltage supply pins for URM0PLL (and LRM1PLL ¹).
GNDP0	—	Ground pins for ULM0PLL (and LLM1PLL ¹).
GNDP1	—	Ground pins for URM0PLL (and LRM1PLL ¹).
V _{CCIOx}	—	V _{CCIO} - The power supply pins for I/O bank x. Dedicated Pins.
V _{REF1(x)} , V _{REF2(x)}	—	Reference supply pins for I/O bank x. Pre-determined pins in each bank are assigned as V _{REF} inputs. When not used, they may be used as I/O pins.
PLL and Clock Functions (Used as user programmable I/O pins when not in use for PLL or clock pins)		
[LOC][num]_PLL[T, C]_IN_A	—	Reference clock (PLL) input Pads: ULM, LLM, URM, LRM, num = row from center, T = true and C = complement, index A, B, C...at each side.
[LOC][num]_PLL[T, C]_FB_A	—	Optional feedback (PLL) input Pads: ULM, LLM, URM, LRM, num = row from center, T = true and C = complement, index A, B, C...at each side.
PCLK[T, C]_[n:0]_[3:0]	—	Primary Clock Pads, T = true and C = complement, n per side, indexed by bank and 0,1, 2, 3 within bank.
[LOC]DQS[num]	—	DQS input Pads: T (Top), R (Right), B (Bottom), L (Left), DQS, num = Ball function number. Any pad can be configured to be DQS output.

LatticeXP Family Data Sheet

Ordering Information

December 2005

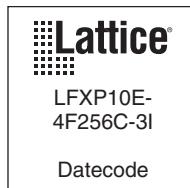

Data Sheet DS1001

Part Number Description

Ordering Information (Contact Factory for Specific Device Availability)

Note: LatticeXP devices are dual marked. For example, the commercial speed grade LFXP10E-4F256C is also marked with industrial grade -3I (LFXP10E-3F256I). The commercial grade is one speed grade faster than the associated dual mark industrial grade. The slowest commercial speed grade does not have industrial markings. The markings appear as follows:

Commercial (Cont.)

Part Number	I/Os	Voltage	Grade	Package	Pins	Temp.	LUTs
