### Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

#### Details

|                                |                                                                                                                                                                     |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Features

### ■ Non-volatile, Infinitely Reconfigurable

- Instant-on – powers up in microseconds
- No external configuration memory
- Excellent design security, no bit stream to intercept
- Reconfigure SRAM based logic in milliseconds
- SRAM and non-volatile memory programmable through system configuration and JTAG ports

### ■ Sleep Mode

- Allows up to 1000x static current reduction

### ■ TransFR™ Reconfiguration (TFR)

- In-field logic update while system operates

### ■ Extensive Density and Package Options

- 3.1K to 19.7K LUT4s
- 62 to 340 I/Os
- Density migration supported

### ■ Embedded and Distributed Memory

- 54 Kbits to 396 Kbits sysMEM™ Embedded Block RAM
- Up to 79 Kbits distributed RAM
- Flexible memory resources:
  - Distributed and block memory

### ■ Flexible I/O Buffer

- Programmable sysIO™ buffer supports wide range of interfaces:
  - LVCMOS 3.3/2.5/1.8/1.5/1.2
  - LVTTTL
  - SSTL 18 Class I
  - SSTL 3/2 Class I, II
  - HSTL15 Class I, III
  - HSTL 18 Class I, II, III
  - PCI
  - LVDS, Bus-LVDS, LVPECL, RSDS

### ■ Dedicated DDR Memory Support

- Implements interface up to DDR333 (166MHz)

### ■ sysCLOCK™ PLLs

- Up to 4 analog PLLs per device
- Clock multiply, divide and phase shifting

### ■ System Level Support

- IEEE Standard 1149.1 Boundary Scan, plus ispTRACY™ internal logic analyzer capability
- Onboard oscillator for configuration
- Devices operate with 3.3V, 2.5V, 1.8V or 1.2V power supply

**Table 2-1. Slice Signal Descriptions**

| Function | Type             | Signal Names   | Description                                                          |
|----------|------------------|----------------|----------------------------------------------------------------------|
| Input    | Data signal      | A0, B0, C0, D0 | Inputs to LUT4                                                       |
| Input    | Data signal      | A1, B1, C1, D1 | Inputs to LUT4                                                       |
| Input    | Multi-purpose    | M0             | Multipurpose Input                                                   |
| Input    | Multi-purpose    | M1             | Multipurpose Input                                                   |
| Input    | Control signal   | CE             | Clock Enable                                                         |
| Input    | Control signal   | LSR            | Local Set/Reset                                                      |
| Input    | Control signal   | CLK            | System Clock                                                         |
| Input    | Inter-PFU signal | FCIN           | Fast Carry In <sup>1</sup>                                           |
| Output   | Data signals     | F0, F1         | LUT4 output register bypass signals                                  |
| Output   | Data signals     | Q0, Q1         | Register Outputs                                                     |
| Output   | Data signals     | OFX0           | Output of a LUT5 MUX                                                 |
| Output   | Data signals     | OFX1           | Output of a LUT6, LUT7, LUT8 <sup>2</sup> MUX depending on the slice |
| Output   | Inter-PFU signal | FCO            | For the right most PFU the fast carry chain output <sup>1</sup>      |

1. See Figure 2-2 for connection details.

2. Requires two PFUs.

### Modes of Operation

Each Slice is capable of four modes of operation: Logic, Ripple, RAM and ROM. The Slice in the PFF is capable of all modes except RAM. Table 2-2 lists the modes and the capability of the Slice blocks.

**Table 2-2. Slice Modes**

|           | Logic              | Ripple                | RAM     | ROM          |
|-----------|--------------------|-----------------------|---------|--------------|
| PFU Slice | LUT 4x2 or LUT 5x1 | 2-bit Arithmetic Unit | SP 16x2 | ROM 16x1 x 2 |
| PFF Slice | LUT 4x2 or LUT 5x1 | 2-bit Arithmetic Unit | N/A     | ROM 16x1 x 2 |

**Logic Mode:** In this mode, the LUTs in each Slice are configured as 4-input combinatorial lookup tables. A LUT4 can have 16 possible input combinations. Any logic function with four inputs can be generated by programming this lookup table. Since there are two LUT4s per Slice, a LUT5 can be constructed within one Slice. Larger lookup tables such as LUT6, LUT7 and LUT8 can be constructed by concatenating other Slices.

**Ripple Mode:** Ripple mode allows the efficient implementation of small arithmetic functions. In ripple mode, the following functions can be implemented by each Slice:

- Addition 2-bit
- Subtraction 2-bit
- Add/Subtract 2-bit using dynamic control
- Up counter 2-bit
- Down counter 2-bit
- Ripple mode multiplier building block
- Comparator functions of A and B inputs
  - A greater-than-or-equal-to B
  - A not-equal-to B
  - A less-than-or-equal-to B

Two additional signals: Carry Generate and Carry Propagate are generated per Slice in this mode, allowing fast arithmetic functions to be constructed by concatenating Slices.

**RAM Mode:** In this mode, distributed RAM can be constructed using each LUT block as a 16x1-bit memory. Through the combination of LUTs and Slices, a variety of different memories can be constructed.

For more information on the PLL, please see details of additional technical documentation at the end of this data sheet.

## Dynamic Clock Select (DCS)

The DCS is a global clock buffer with smart multiplexer functions. It takes two independent input clock sources and outputs a clock signal without any glitches or runt pulses. This is achieved irrespective of where the select signal is toggled. There are eight DCS blocks per device, located in pairs at the center of each side. Figure 2-12 illustrates the DCS Block Macro.

**Figure 2-12. DCS Block Primitive**

Figure 2-13 shows timing waveforms of the default DCS operating mode. The DCS block can be programmed to other modes. For more information on the DCS, please see details of additional technical documentation at the end of this data sheet.

**Figure 2-13. DCS Waveforms**

## sysMEM Memory

The LatticeXP family of devices contain a number of sysMEM Embedded Block RAM (EBR). The EBR consists of a 9-Kbit RAM, with dedicated input and output registers.

### sysMEM Memory Block

The sysMEM block can implement single port, dual port or pseudo dual port memories. Each block can be used in a variety of depths and widths as shown in Table 2-6.

**Figure 2-15. Memory Core Reset**

For further information on sysMEM EBR block, see the details of additional technical documentation at the end of this data sheet.

### EBR Asynchronous Reset

EBR asynchronous reset or GSR (if used) can only be applied if all clock enables are low for a clock cycle before the reset is applied and released a clock cycle after the reset is released, as shown in Figure 2-16. The GSR input to the EBR is always asynchronous.

**Figure 2-16. EBR Asynchronous Reset (Including GSR) Timing Diagram**

If all clock enables remain enabled, the EBR asynchronous reset or GSR may only be applied and released after the EBR read and write clock inputs are in a steady state condition for a minimum of  $1/f_{MAX}$  (EBR clock). The reset release must adhere to the EBR synchronous reset setup time before the next active read or write clock edge.

If an EBR is pre-loaded during configuration, the GSR input must be disabled or the release of the GSR during device Wake Up must occur before the release of the device I/Os becoming active.

These instructions apply to all EBR RAM and ROM implementations.

Note that there are no reset restrictions if the EBR synchronous reset is used and the EBR GSR input is disabled.

### Programmable I/O Cells (PICs)

Each PIC contains two PIOs connected to their respective sysIO Buffers which are then connected to the PADs as shown in Figure 2-17. The PIO Block supplies the output data (DO) and the Tri-state control signal (TO) to sysIO buffer, and receives input from the buffer.

**Figure 2-21. Input Register DDR Waveforms****Figure 2-22. INDDRXB Primitive****Output Register Block**

The output register block provides the ability to register signals from the core of the device before they are passed to the sysIO buffers. The block contains a register for SDR operation that is combined with an additional latch for DDR operation. Figure 2-23 shows the diagram of the Output Register Block.

In SDR mode, ONEG0 feeds one of the flip-flops that then feeds the output. The flip-flop can be configured as a D-type or as a latch. In DDR mode, ONEG0 is fed into one register on the positive edge of the clock and OPOS0 is latched. A multiplexer running off the same clock selects the correct register for feeding to the output (D0).

Figure 2-24 shows the design tool DDR primitives. The SDR output register has reset and clock enable available. The additional register for DDR operation does not have reset or clock enable available.

**Supply Current (Standby)<sup>1, 2, 3, 4</sup>****Over Recommended Operating Conditions**

| Symbol      | Parameter                                    | Device    | Typ. <sup>5</sup> | Units |
|-------------|----------------------------------------------|-----------|-------------------|-------|
| $I_{CC}$    | Core Power Supply                            | LFXP3E    | 15                | mA    |

1. For further information on supply current, please see details of additional technical documentation at the end of this data sheet.

2. Assumes all outputs are tristated, all inputs are configured as LVCMOS and held at the VCCIO or GND.

3. Frequency 0MHz.

4. User pattern: blank.

5.  $T_A=25^{\circ}C$ , power supplies at nominal voltage.

6. Per bank.

### Part Number Description

### Ordering Information (Contact Factory for Specific Device Availability)

Note: LatticeXP devices are dual marked. For example, the commercial speed grade LFXP10E-4F256C is also marked with industrial grade -3I (LFXP10E-3F256I). The commercial grade is one speed grade faster than the associated dual mark industrial grade. The slowest commercial speed grade does not have industrial markings. The markings appear as follows:

**Commercial (Cont.)**

| Part Number   | I/Os | Voltage | Grade | Package | Pins | Temp. | LUTs |
|---------------|------|---------|-------|---------|------|-------|------|
| LFXP6E-3F256C | 188  | 1.2V    | -3    | fpBGA   | 256  | COM   | 5.8K |
| LFXP6E-4F256C | 188  | 1.2V    | -4    | fpBGA   | 256  | COM   | 5.8K |
| LFXP6E-5F256C | 188  | 1.2V    | -5    | fpBGA   | 256  | COM   | 5.8K |
| LFXP6E-3Q208C | 142  | 1.2V    | -3    | PQFP    | 208  | COM   | 5.8K |
| LFXP6E-4Q208C | 142  | 1.2V    | -4    | PQFP    | 208  | COM   | 5.8K |
| LFXP6E-5Q208C | 142  | 1.2V    | -5    | PQFP    | 208  | COM   | 5.8K |
| LFXP6E-3T144C | 100  | 1.2V    | -3    | TQFP    | 144  | COM   | 5.8K |
| LFXP6E-4T144C | 100  | 1.2V    | -4    | TQFP    | 144  | COM   | 5.8K |
| LFXP6E-5T144C | 100  | 1.2V    | -5    | TQFP    | 144  | COM   | 5.8K |

| Part Number    | I/Os | Voltage | Grade | Package | Pins | Temp. | LUTs |
|----------------|------|---------|-------|---------|------|-------|------|
| LFXP10E-3F388C | 244  | 1.2V    | -3    | fpBGA   | 388  | COM   | 9.7K |
| LFXP10E-4F388C | 244  | 1.2V    | -4    | fpBGA   | 388  | COM   | 9.7K |
