Understanding Embedded - FPGAs (Field Programmable Gate Array)

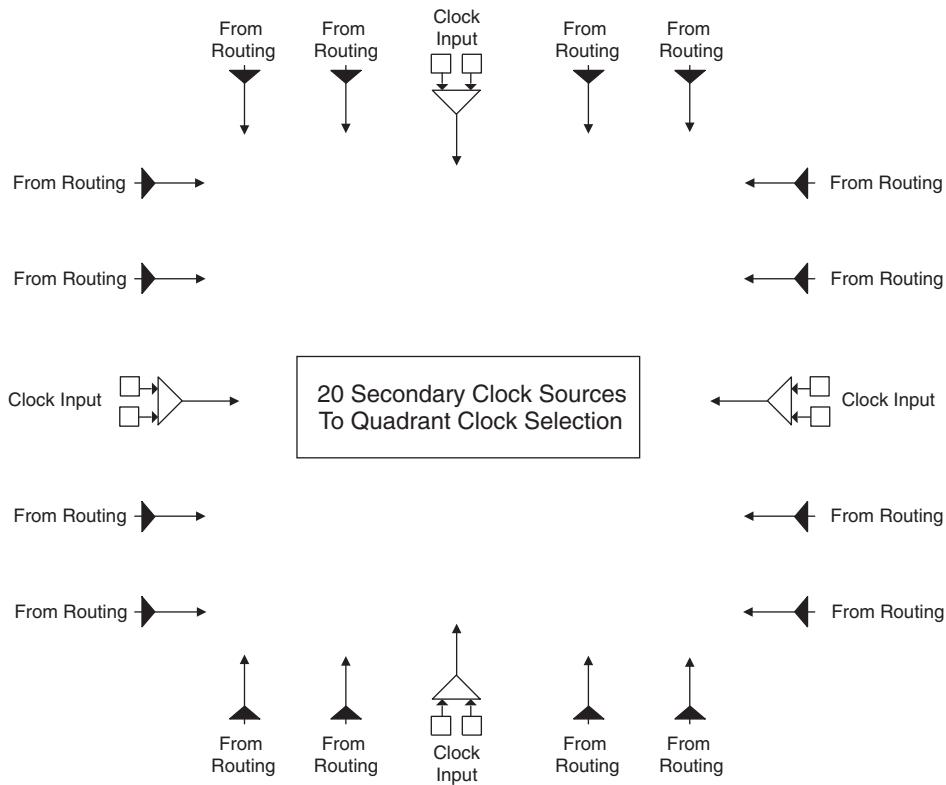

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

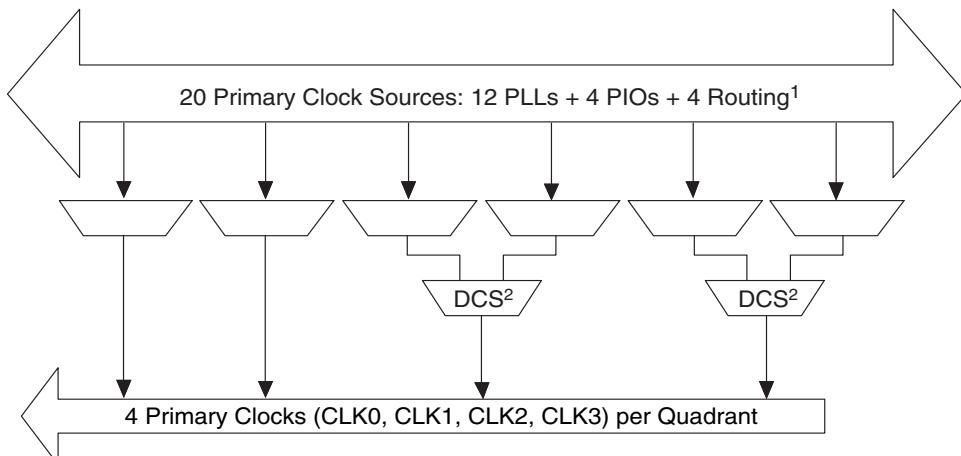

Details

Product Status	Obsolete
Number of LABs/CLBs	-
Number of Logic Elements/Cells	20000
Total RAM Bits	405504
Number of I/O	340
Number of Gates	-
Voltage - Supply	1.71V ~ 3.465V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	484-BBGA
Supplier Device Package	484-FPBGA (23x23)
Purchase URL	https://www.e-xfl.com/product-detail/lattice-semiconductor/lfxp20c-4fn484i

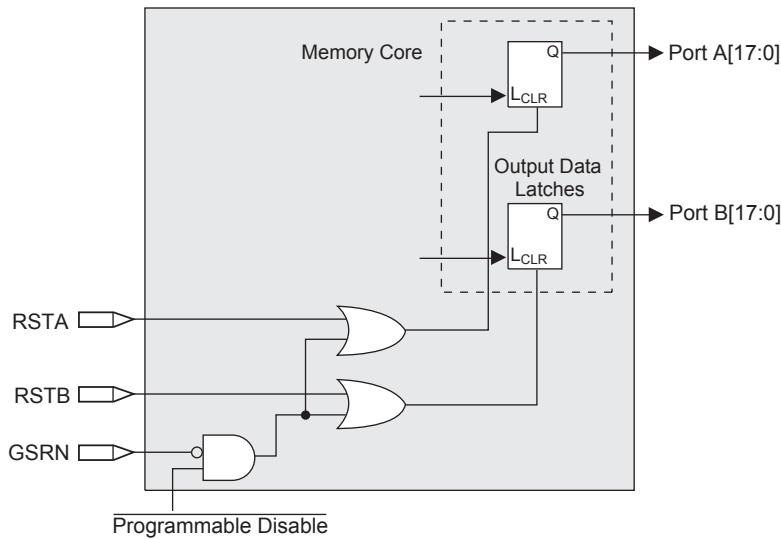

Figure 2-6. Secondary Clock Sources

Clock Routing

The clock routing structure in LatticeXP devices consists of four Primary Clock lines and a Secondary Clock network per quadrant. The primary clocks are generated from MUXes located in each quadrant. Figure 2-7 shows this clock routing. The four secondary clocks are generated from MUXes located in each quadrant as shown in Figure 2-8. Each slice derives its clock from the primary clock lines, secondary clock lines and routing as shown in Figure 2-9.

Figure 2-7. Per Quadrant Primary Clock Selection

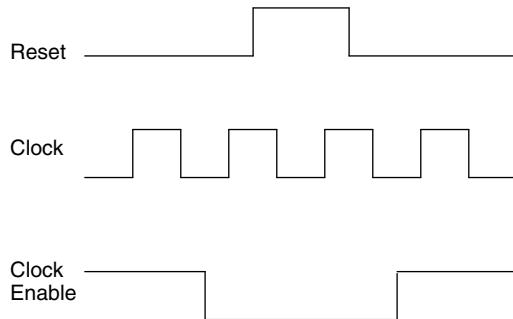

1. Smaller devices have fewer PLL related lines.
2. Dynamic clock select.

Figure 2-15. Memory Core Reset

For further information on sysMEM EBR block, see the details of additional technical documentation at the end of this data sheet.

EBR Asynchronous Reset

EBR asynchronous reset or GSR (if used) can only be applied if all clock enables are low for a clock cycle before the reset is applied and released a clock cycle after the reset is released, as shown in Figure 2-16. The GSR input to the EBR is always asynchronous.

Figure 2-16. EBR Asynchronous Reset (Including GSR) Timing Diagram

If all clock enables remain enabled, the EBR asynchronous reset or GSR may only be applied and released after the EBR read and write clock inputs are in a steady state condition for a minimum of $1/f_{MAX}$ (EBR clock). The reset release must adhere to the EBR synchronous reset setup time before the next active read or write clock edge.

If an EBR is pre-loaded during configuration, the GSR input must be disabled or the release of the GSR during device Wake Up must occur before the release of the device I/Os becoming active.

These instructions apply to all EBR RAM and ROM implementations.

Note that there are no reset restrictions if the EBR synchronous reset is used and the EBR GSR input is disabled.

Programmable I/O Cells (PICs)

Each PIC contains two PIOs connected to their respective sysIO Buffers which are then connected to the PADs as shown in Figure 2-17. The PIO Block supplies the output data (DO) and the Tri-state control signal (TO) to sysIO buffer, and receives input from the buffer.

Polarity Control Logic

In a typical DDR Memory interface design, the phase relation between the incoming delayed DQS strobe and the internal system Clock (during the READ cycle) is unknown.

The LatticeXP family contains dedicated circuits to transfer data between these domains. To prevent setup and hold violations at the domain transfer between DQS (delayed) and the system Clock a clock polarity selector is used. This changes the edge on which the data is registered in the synchronizing registers in the input register block. This requires evaluation at the start of the each READ cycle for the correct clock polarity.

Prior to the READ operation in DDR memories DQS is in tristate (pulled by termination). The DDR memory device drives DQS low at the start of the preamble state. A dedicated circuit detects this transition. This signal is used to control the polarity of the clock to the synchronizing registers.

sysIO Buffer

Each I/O is associated with a flexible buffer referred to as a sysIO buffer. These buffers are arranged around the periphery of the device in eight groups referred to as Banks. The sysIO buffers allow users to implement the wide variety of standards that are found in today's systems including LVCMOS, SSTL, HSTL, LVDS and LVPECL.

sysIO Buffer Banks

LatticeXP devices have eight sysIO buffer banks; each is capable of supporting multiple I/O standards. Each sysIO bank has its own I/O supply voltage (V_{CCIO}), and two voltage references V_{REF1} and V_{REF2} resources allowing each bank to be completely independent from each other. Figure 2-28 shows the eight banks and their associated supplies.

In the LatticeXP devices, single-ended output buffers and ratioed input buffers (LVTTL, LVCMOS, PCI and PCI-X) are powered using V_{CCIO} . LVTTL, LVCMOS33, LVCMOS25 and LVCMOS12 can also be set as a fixed threshold input independent of V_{CCIO} . In addition to the bank V_{CCIO} supplies, the LatticeXP devices have a V_{CC} core logic power supply, and a V_{CCAUX} supply that power all differential and referenced buffers.

Each bank can support up to two separate VREF voltages, VREF1 and VREF2 that set the threshold for the referenced input buffers. In the LatticeXP devices, a dedicated pin in a bank can be configured to be a reference voltage supply pin. Each I/O is individually configurable based on the bank's supply and reference voltages.

Supply Current (Standby)^{1, 2, 3, 4}

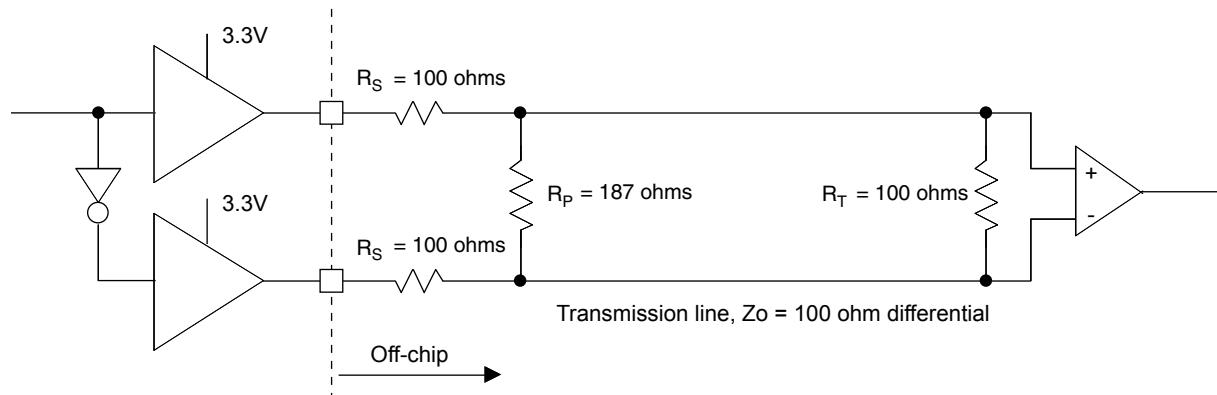

Over Recommended Operating Conditions

Symbol	Parameter	Device	Typ. ⁵	Units
I_{CC}	Core Power Supply	LFXP3E	15	mA
		LFXP6E	20	mA
		LFXP10E	35	mA
		LFXP15E	45	mA
		LFXP20E	55	mA
		LFXP3C	35	mA
		LFXP6C	40	mA
		LFXP10C	70	mA
		LFXP15C	80	mA

I_{CCIO}	Bank Power Supply ⁶	All	2	mA
I_{CCJ}	V_{CCJ} Power Supply	All	1	mA

1. For further information on supply current, please see details of additional technical documentation at the end of this data sheet.
2. Assumes all outputs are tristated, all inputs are configured as LVCMS and held at the VCCIO or GND.
3. Frequency 0MHz.
4. User pattern: blank.
5. $T_A=25^\circ C$, power supplies at nominal voltage.
6. Per bank.

LVPECL

The LatticeXP devices support differential LVPECL standard. This standard is emulated using complementary LVC MOS outputs in conjunction with a parallel resistor across the driver outputs. The LVPECL input standard is supported by the LVDS differential input buffer. The scheme shown in Figure 3-3 is one possible solution for point-to-point signals.

Figure 3-3. Differential LVPECL**Table 3-3. LVPECL DC Conditions¹****Over Recommended Operating Conditions**

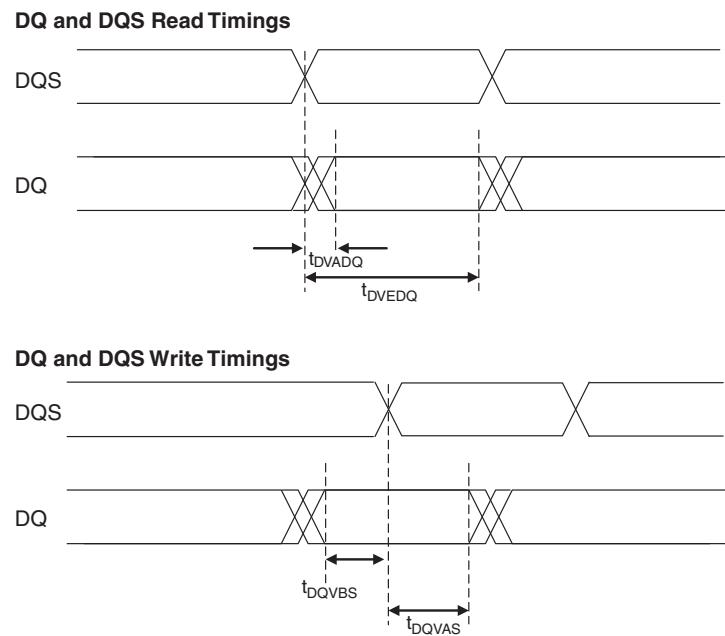

Symbol	Description	Typical	Units
Z_{OUT}	Output impedance	100	ohms
R_P	Driver parallel resistor	187	ohms
R_S	Driver series resistor	100	ohms
R_T	Receiver termination	100	ohms
V_{OH}	Output high voltage	2.03	V
V_{OL}	Output low voltage	1.27	V
V_{OD}	Output differential voltage	0.76	V
V_{CM}	Output common mode voltage	1.65	V
Z_{BACK}	Back impedance	85.7	ohms
I_{DC}	DC output current	12.7	mA

1. For input buffer, see LVDS table.

For further information on LVPECL, BLVDS and other differential interfaces please see details of additional technical documentation at the end of the data sheet.

RSDS

The LatticeXP devices support differential RSDS standard. This standard is emulated using complementary LVC MOS outputs in conjunction with a parallel resistor across the driver outputs. The RSDS input standard is supported by the LVDS differential input buffer. The scheme shown in Figure 3-4 is one possible solution for RSDS standard implementation. Use LVDS25E mode with suggested resistors for RSDS operation. Resistor values in Figure 3-4 are industry standard values for 1% resistors.

H6	VCCIO7	7	-	-	VCCIO7	7	-	-

1. Applies to LFXP "C" only.

2. Applies to LFXP "E" only.

3. Supports dedicated LVDS outputs.
