Lattice Semiconductor Corporation - LFXP20E-4FN256C Datasheet

Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Obsolete
Number of LABs/CLBs	-
Number of Logic Elements/Cells	20000
Total RAM Bits	405504
Number of I/O	188
Number of Gates	-
Voltage - Supply	1.14V ~ 1.26V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	256-BGA
Supplier Device Package	256-FPBGA (17x17)
Purchase URL	https://www.e-xfl.com/product-detail/lattice-semiconductor/lfxp20e-4fn256c

Table 2-1. Slice Signal Descriptions

Function	Type	Signal Names	Description
Input	Data signal	A0, B0, C0, D0	Inputs to LUT4
Input	Data signal	A1, B1, C1, D1	Inputs to LUT4
Input	Multi-purpose	M0	Multipurpose Input
Input	Multi-purpose	M1	Multipurpose Input
Input	Control signal	CE	Clock Enable
Input	Control signal	LSR	Local Set/Reset
Input	Control signal	CLK	System Clock
Input	Inter-PFU signal	FCIN	Fast Carry In[1]
Output	Data signals	F0, F1	LUT4 output register bypass signals
Output	Data signals	Q0, Q1	Register Outputs
Output	Data signals	OFX0	Output of a LUT5 MUX
Output	Data signals	OFX1	Output of a LUT6, LUT7, LUT8[2] MUX depending on the slice
Output	Inter-PFU signal	FCO	For the right most PFU the fast carry chain output[1]

1. See Figure 2-2 for connection details.
2. Requires two PFUs.

Modes of Operation

Each Slice is capable of four modes of operation: Logic, Ripple, RAM and ROM. The Slice in the PFF is capable of all modes except RAM. Table 2-2 lists the modes and the capability of the Slice blocks.

Table 2-2. Slice Modes

	Logic	Ripple	RAM	ROM
PFU Slice	LUT 4x2 or LUT 5x1	2-bit Arithmetic Unit	SP 16x2	ROM 16x1 x 2
PFF Slice	LUT 4x2 or LUT 5x1	2-bit Arithmetic Unit	N/A	ROM 16x1 x 2

Logic Mode: In this mode, the LUTs in each Slice are configured as 4-input combinatorial lookup tables. A LUT4 can have 16 possible input combinations. Any logic function with four inputs can be generated by programming this lookup table. Since there are two LUT4s per Slice, a LUT5 can be constructed within one Slice. Larger lookup tables such as LUT6, LUT7 and LUT8 can be constructed by concatenating other Slices.

Ripple Mode: Ripple mode allows the efficient implementation of small arithmetic functions. In ripple mode, the following functions can be implemented by each Slice:

- Addition 2-bit
- Subtraction 2-bit
- Add/Subtract 2-bit using dynamic control
- Up counter 2-bit
- Down counter 2-bit
- Ripple mode multiplier building block
- Comparator functions of A and B inputs
  - A greater-than-or-equal-to B
  - A not-equal-to B
  - A less-than-or-equal-to B

Two additional signals: Carry Generate and Carry Propagate are generated per Slice in this mode, allowing fast arithmetic functions to be constructed by concatenating Slices.

RAM Mode: In this mode, distributed RAM can be constructed using each LUT block as a 16x1-bit memory. Through the combination of LUTs and Slices, a variety of different memories can be constructed.

Figure 2-10. PLL Diagram

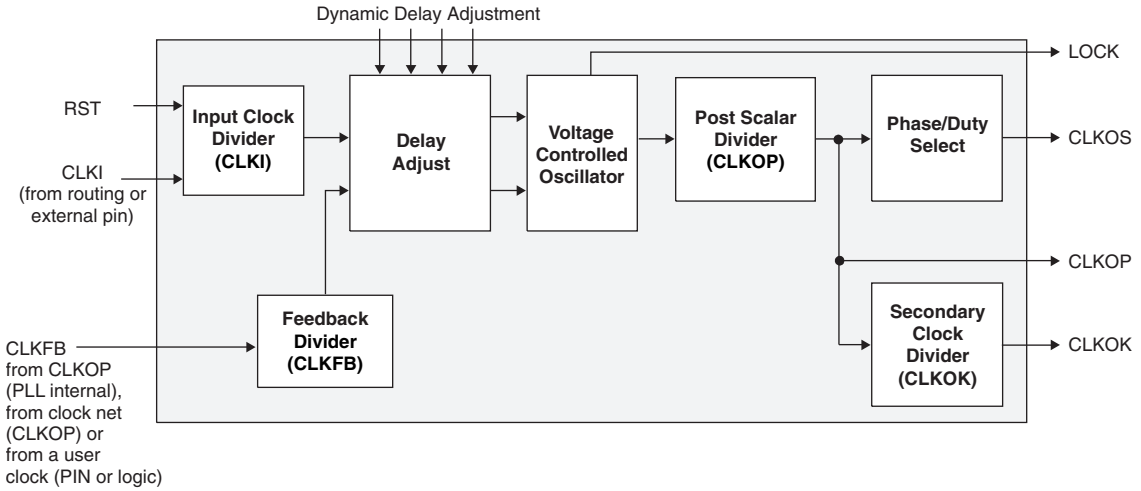

Figure 2-11 shows the available macros for the PLL. Table 2-11 provides signal description of the PLL Block.

Figure 2-11. PLL Primitive

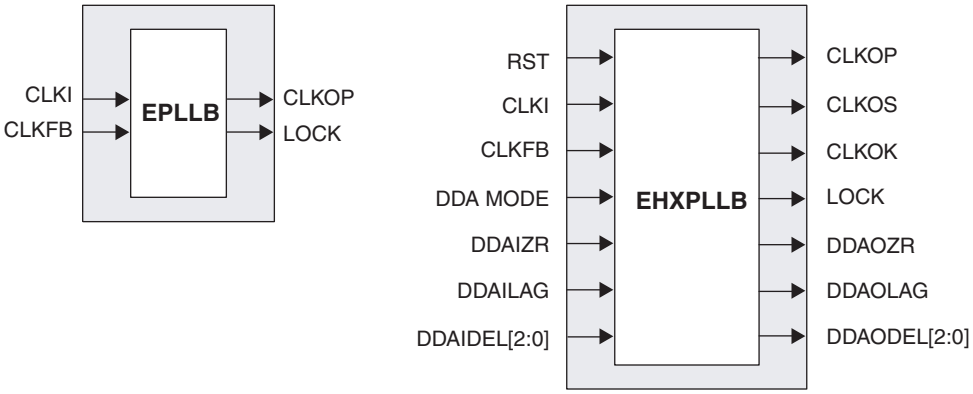

Table 2-5. PLL Signal Descriptions

Signal	I/O	Description
CLKI	I	Clock input from external pin or routing
CLKFB	I	PLL feedback input from CLKOP (PLL internal), from clock net (CLKOP) or from a user clock (PIN or logic)
RST	I	“1” to reset input clock divider
CLKOS	O	PLL output clock to clock tree (phase shifted/duty cycle changed)
CLKOP	O	PLL output clock to clock tree (No phase shift)
CLKOK	O	PLL output to clock tree through secondary clock divider
LOCK	O	“1” indicates PLL LOCK to CLKI
DDAMODE	I	Dynamic Delay Enable. “1” Pin control (dynamic), “0”: Fuse Control (static)
DDAIZR	I	Dynamic Delay Zero. “1”: delay = 0, “0”: delay = on
DDAILAG	I	Dynamic Delay Lag/Lead. “1”: Lag, “0”: Lead
DDAIDEL[2:0]	I	Dynamic Delay Input
DDAOZR	O	Dynamic Delay Zero Output
DDAOLAG	O	Dynamic Delay Lag/Lead Output
DDAODEL[2:0]	O	Dynamic Delay Output

Polarity Control Logic

In a typical DDR Memory interface design, the phase relation between the incoming delayed DQS strobe and the internal system Clock (during the READ cycle) is unknown.

The LatticeXP family contains dedicated circuits to transfer data between these domains. To prevent setup and hold violations at the domain transfer between DQS (delayed) and the system Clock a clock polarity selector is used. This changes the edge on which the data is registered in the synchronizing registers in the input register block. This requires evaluation at the start of the each READ cycle for the correct clock polarity.

Prior to the READ operation in DDR memories DQS is in tristate (pulled by termination). The DDR memory device drives DQS low at the start of the preamble state. A dedicated circuit detects this transition. This signal is used to control the polarity of the clock to the synchronizing registers.

sysIO Buffer

Each I/O is associated with a flexible buffer referred to as a sysIO buffer. These buffers are arranged around the periphery of the device in eight groups referred to as Banks. The sysIO buffers allow users to implement the wide variety of standards that are found in today's systems including LVCMOS, SSTL, HSTL, LVDS and LVPECL.

sysIO Buffer Banks

LatticeXP devices have eight sysIO buffer banks; each is capable of supporting multiple I/O standards. Each sysIO bank has its own I/O supply voltage (V_{CCIO}), and two voltage references V_{REF1} and V_{REF2} resources allowing each bank to be completely independent from each other. Figure 2-28 shows the eight banks and their associated supplies.

In the LatticeXP devices, single-ended output buffers and ratioed input buffers (LVTTL, LVCMOS, PCI and PCI-X) are powered using V_{CCIO}. LVTTL, LVCMOS33, LVCMOS25 and LVCMOS12 can also be set as a fixed threshold input independent of $V_{CCIO.}$ In addition to the bank V_{CCIO} supplies, the LatticeXP devices have a V_{CC} core logic power supply, and a V_{CCAUX} supply that power all differential and referenced buffers.

Each bank can support up to two separate VREF voltages, VREF1 and VREF2 that set the threshold for the referenced input buffers. In the LatticeXP devices, a dedicated pin in a bank can be configured to be a reference voltage supply pin. Each I/O is individually configurable based on the bank's supply and reference voltages.

Figure 2-29 provides a pictorial representation of the different programming ports and modes available in the LatticeXP devices.

On power-up, the FPGA SRAM is ready to be configured with the sysCONFIG port active. The IEEE 1149.1 serial mode can be activated any time after power-up by sending the appropriate command through the TAP port.

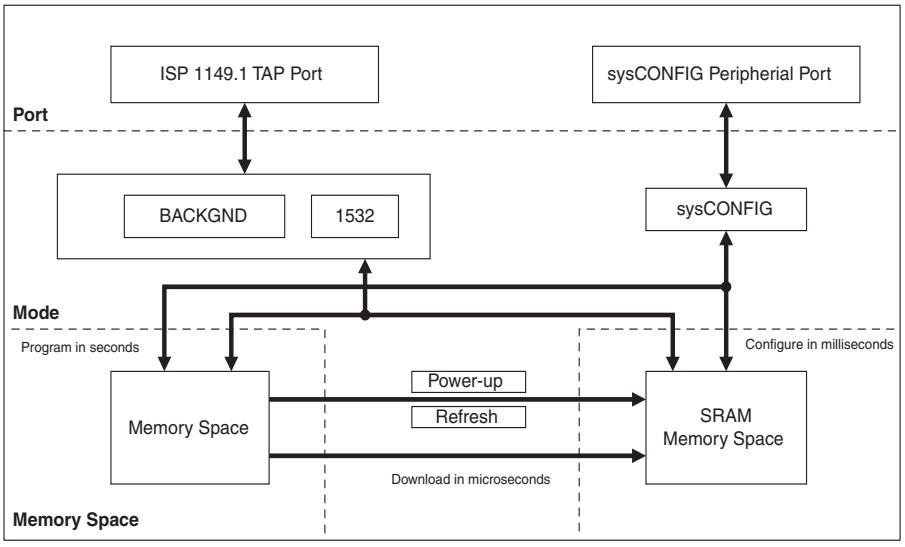
Leave Alone I/O
When using 1532 mode for non-volatile memory programming, users may specify I/Os as high, low, tristated or held at current value. This provides excellent flexibility for implementing systems where reprogramming occurs on-the-fly.

TransFR (Transparent Field Reconfiguration)
TransFR (TFR) is a unique Lattice technology that allows users to update their logic in the field without interrupting system operation using a single ispVM command. See Lattice technical note #TN1087, *Minimizing System Interruption During Configuration Using TransFR Technology,* for details.

Security
The LatticeXP devices contain security bits that, when set, prevent the readback of the SRAM configuration and non-volatile memory spaces. Once set, the only way to clear security bits is to erase the memory space.

For more information on device configuration, please see details of additional technical documentation at the end of this data sheet.

Figure 2-29. ispXP Block Diagram



Internal Logic Analyzer Capability (ispTRACY)

All LatticeXP devices support an internal logic analyzer diagnostic feature. The diagnostic features provide capabilities similar to an external logic analyzer, such as programmable event and trigger condition and deep trace memory. This feature is enabled by Lattice's ispTRACY. The ispTRACY utility is added into the user design at compile time.

For more information on ispTRACY, please see information regarding additional technical documentation at the end of this data sheet.

Oscillator

Every LatticeXP device has an internal CMOS oscillator which is used to derive a master serial clock for configuration. The oscillator and the master serial clock run continuously in the configuration mode. The default value of the

Supply Current (Standby)[1, 2, 3, 4]

Over Recommended Operating Conditions

Symbol	Parameter	Device	Typ.[5]	Units
I_{CC}	Core Power Supply	LFXP3E	15	mA
		LFXP6E	20	mA
		LFXP10E	35	mA

I_{CCJ}	V_{CCJ} Power Supply	All	1	mA

1. For further information on supply current, please see details of additional technical documentation at the end of this data sheet.
2. Assumes all outputs are tristated, all inputs are configured as LVCMOS and held at the VCCIO or GND.
3. Frequency 0MHz.
4. User pattern: blank.
5. T_A=25°C, power supplies at nominal voltage.
6. Per bank.

Switching Test Conditions

Figure 3-13 shows the output test load that is used for AC testing. The specific values for resistance, capacitance, voltage, and other test conditions are shown in Figure 3-5.

Figure 3-13. Output Test Load, LVTTL and LVCMOS Standards

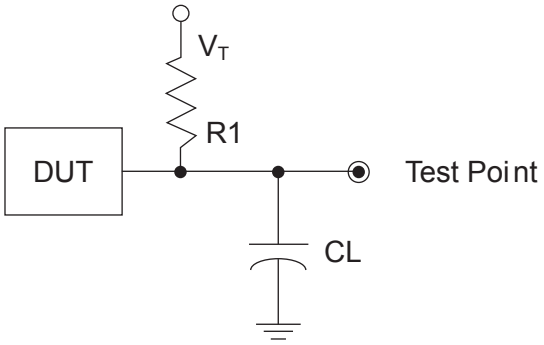

Table 3-5. Test Fixture Required Components, Non-Terminated Interfaces

Test Condition	R_1	C_L	Timing Ref.	V_T
LVTTL and other LVCMOS settings (L -> H, H -> L)	∞	0pF	LVCMOS 3.3 = 1.5V	—
			LVCMOS 2.5 = $V_{CCIO}/2$	—
			LVCMOS 1.8 = $V_{CCIO}/2$	—
			LVCMOS 1.5 = $V_{CCIO}/2$	—
			LVCMOS 1.2 = $V_{CCIO}/2$	—
LVCMOS 2.5 I/O (Z -> H)	188	0pF	$V_{CCIO}/2$	V_{OL}
LVCMOS 2.5 I/O (Z -> L)			$V_{CCIO}/2$	V_{OH}
LVCMOS 2.5 I/O (H -> Z)			V_{OH} - 0.15	V_{OL}
LVCMOS 2.5 I/O (L -> Z)			V_{OL} + 0.15	V_{OH}

Note: Output test conditions for all other interfaces are determined by the respective standards.

L7	VCCIO7	7	-	-	VCCIO7	7	-	-
L8	VCCIO7	7	-	-	VCCIO7	7	-	-

1. Applies to LFXP “C” only.
2. Applies to LFXP “E” only.
3. Supports dedicated LVDS outputs.

Commercial (Cont.)
