

Welcome to [E-XFL.COM](#)

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Details

Product Status	Obsolete
Number of LABs/CLBs	-
Number of Logic Elements/Cells	3000
Total RAM Bits	55296
Number of I/O	136
Number of Gates	-
Voltage - Supply	1.71V ~ 3.465V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	208-BFQFP
Supplier Device Package	208-PQFP (28x28)
Purchase URL	https://www.e-xfl.com/product-detail/lattice-semiconductor/lfxp3c-3qn208c

Features

- **Non-volatile, Infinitely Reconfigurable**
 - Instant-on – powers up in microseconds
 - No external configuration memory
 - Excellent design security, no bit stream to intercept
 - Reconfigure SRAM based logic in milliseconds
 - SRAM and non-volatile memory programmable through system configuration and JTAG ports
- **Sleep Mode**
 - Allows up to 1000x static current reduction
- **TransFR™ Reconfiguration (TFR)**
 - In-field logic update while system operates
- **Extensive Density and Package Options**
 - 3.1K to 19.7K LUT4s
 - 62 to 340 I/Os
 - Density migration supported
- **Embedded and Distributed Memory**
 - 54 Kbits to 396 Kbits sysMEM™ Embedded Block RAM
 - Up to 79 Kbits distributed RAM
 - Flexible memory resources:
 - Distributed and block memory

■ Flexible I/O Buffer

- Programmable sysIO™ buffer supports wide range of interfaces:
 - LVCMS 3.3/2.5/1.8/1.5/1.2
 - LVTTL
 - SSTL 18 Class I
 - SSTL 3/2 Class I, II
 - HSTL15 Class I, III
 - HSTL 18 Class I, II, III
 - PCI
 - LVDS, Bus-LVDS, LVPECL, RSDS

■ Dedicated DDR Memory Support

- Implements interface up to DDR333 (166MHz)

■ sysCLOCK™ PLLs

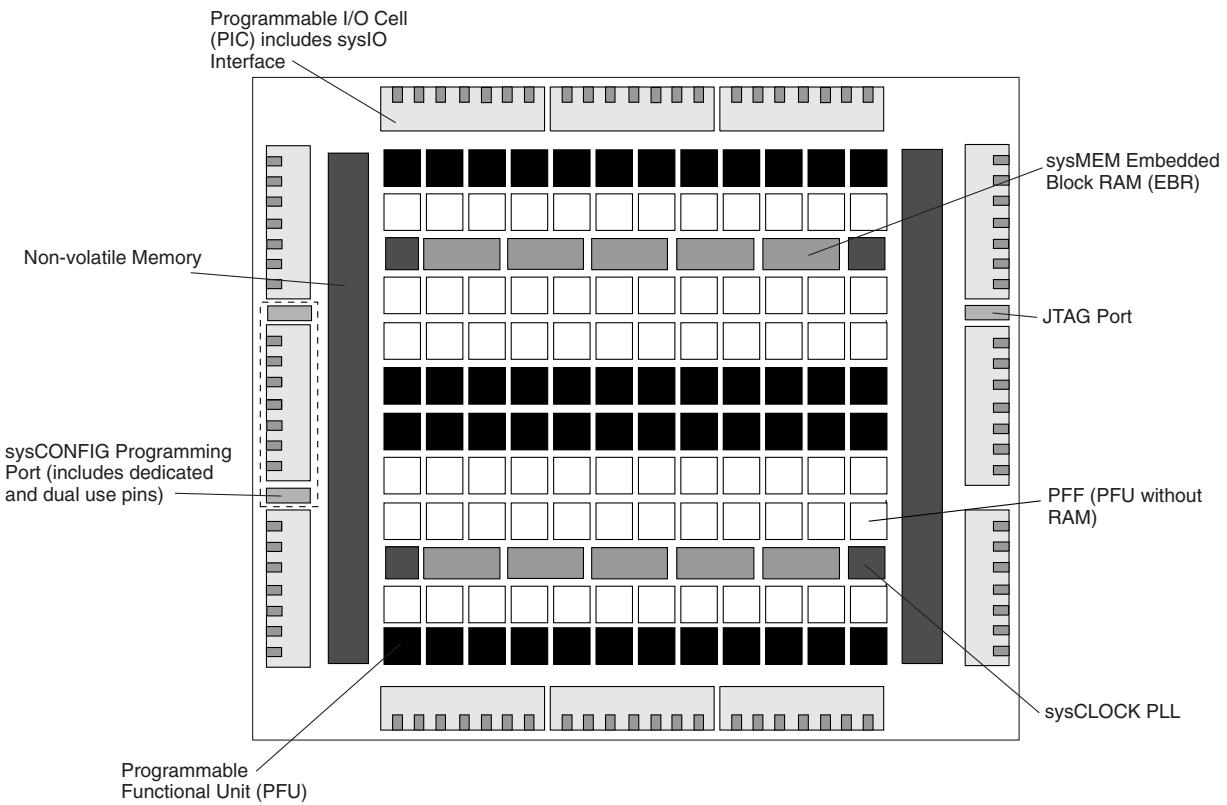

- Up to 4 analog PLLs per device
- Clock multiply, divide and phase shifting

■ System Level Support

- IEEE Standard 1149.1 Boundary Scan, plus ispTRACY™ internal logic analyzer capability
- Onboard oscillator for configuration
- Devices operate with 3.3V, 2.5V, 1.8V or 1.2V power supply

Table 1-1. LatticeXP Family Selection Guide

Figure 2-1. LatticeXP Top Level Block Diagram

PFU and PFF Blocks

The core of the LatticeXP devices consists of PFU and PFF blocks. The PFUs can be programmed to perform Logic, Arithmetic, Distributed RAM and Distributed ROM functions. PFF blocks can be programmed to perform Logic, Arithmetic and ROM functions. Except where necessary, the remainder of the data sheet will use the term PFU to refer to both PFU and PFF blocks.

Each PFU block consists of four interconnected slices, numbered 0-3 as shown in Figure 2-2. All the interconnections to and from PFU blocks are from routing. There are 53 inputs and 25 outputs associated with each PFU block.

Figure 2-2. PFU Diagram

For more information on the PLL, please see details of additional technical documentation at the end of this data sheet.

Dynamic Clock Select (DCS)

The DCS is a global clock buffer with smart multiplexer functions. It takes two independent input clock sources and outputs a clock signal without any glitches or runt pulses. This is achieved irrespective of where the select signal is toggled. There are eight DCS blocks per device, located in pairs at the center of each side. Figure 2-12 illustrates the DCS Block Macro.

Figure 2-12. DCS Block Primitive

Figure 2-13 shows timing waveforms of the default DCS operating mode. The DCS block can be programmed to other modes. For more information on the DCS, please see details of additional technical documentation at the end of this data sheet.

Figure 2-13. DCS Waveforms

sysMEM Memory

The LatticeXP family of devices contain a number of sysMEM Embedded Block RAM (EBR). The EBR consists of a 9-Kbit RAM, with dedicated input and output registers.

sysMEM Memory Block

The sysMEM block can implement single port, dual port or pseudo dual port memories. Each block can be used in a variety of depths and widths as shown in Table 2-6.

Polarity Control Logic

In a typical DDR Memory interface design, the phase relation between the incoming delayed DQS strobe and the internal system Clock (during the READ cycle) is unknown.

The LatticeXP family contains dedicated circuits to transfer data between these domains. To prevent setup and hold violations at the domain transfer between DQS (delayed) and the system Clock a clock polarity selector is used. This changes the edge on which the data is registered in the synchronizing registers in the input register block. This requires evaluation at the start of the each READ cycle for the correct clock polarity.

Prior to the READ operation in DDR memories DQS is in tristate (pulled by termination). The DDR memory device drives DQS low at the start of the preamble state. A dedicated circuit detects this transition. This signal is used to control the polarity of the clock to the synchronizing registers.

sysIO Buffer

Each I/O is associated with a flexible buffer referred to as a sysIO buffer. These buffers are arranged around the periphery of the device in eight groups referred to as Banks. The sysIO buffers allow users to implement the wide variety of standards that are found in today's systems including LVCMOS, SSTL, HSTL, LVDS and LVPECL.

sysIO Buffer Banks

LatticeXP devices have eight sysIO buffer banks; each is capable of supporting multiple I/O standards. Each sysIO bank has its own I/O supply voltage (V_{CCIO}), and two voltage references V_{REF1} and V_{REF2} resources allowing each bank to be completely independent from each other. Figure 2-28 shows the eight banks and their associated supplies.

In the LatticeXP devices, single-ended output buffers and ratioed input buffers (LVTTL, LVCMOS, PCI and PCI-X) are powered using V_{CCIO} . LVTTL, LVCMOS33, LVCMOS25 and LVCMOS12 can also be set as a fixed threshold input independent of V_{CCIO} . In addition to the bank V_{CCIO} supplies, the LatticeXP devices have a V_{CC} core logic power supply, and a V_{CCAUX} supply that power all differential and referenced buffers.

Each bank can support up to two separate VREF voltages, VREF1 and VREF2 that set the threshold for the referenced input buffers. In the LatticeXP devices, a dedicated pin in a bank can be configured to be a reference voltage supply pin. Each I/O is individually configurable based on the bank's supply and reference voltages.

Typical I/O Behavior During Power-up

The internal power-on-reset (POR) signal is deactivated when V_{CC} and V_{CCAUX} have reached satisfactory levels. After the POR signal is deactivated, the FPGA core logic becomes active. It is the user's responsibility to ensure that all other V_{CCIO} banks are active with valid input logic levels to properly control the output logic states of all the I/O banks that are critical to the application. The default configuration of the I/O pins in a blank device is tri-state with a weak pull-up to V_{CCIO} . The I/O pins will not take on the user configuration until V_{CC} , V_{CCAUX} and V_{CCIO} have reached satisfactory levels at which time the I/Os will take on the user-configured settings.

The V_{CC} and V_{CCAUX} supply the power to the FPGA core fabric, whereas the V_{CCIO} supplies power to the I/O buffers. In order to simplify system design while providing consistent and predictable I/O behavior, it is recommended that the I/O buffers be powered-up prior to the FPGA core fabric. V_{CCIO} supplies should be powered up before or together with the V_{CC} and V_{CCAUX} supplies.

Supported Standards

The LatticeXP sysIO buffer supports both single-ended and differential standards. Single-ended standards can be further subdivided into LVCMS, LVTTL and other standards. The buffers support the LVTTL, LVCMS 1.2, 1.5, 1.8, 2.5 and 3.3V standards. In the LVCMS and LVTTL modes, the buffer has individually configurable options for drive strength, bus maintenance (weak pull-up, weak pull-down, or a bus-keeper latch) and open drain. Other single-ended standards supported include SSTL and HSTL. Differential standards supported include LVDS, BLVDS, LVPECL, differential SSTL and differential HSTL. Tables 2-7 and 2-8 show the I/O standards (together with their supply and reference voltages) supported by the LatticeXP devices. For further information on utilizing the sysIO buffer to support a variety of standards please see the details of additional technical documentation at the end of this data sheet.

Table 2-7. Supported Input Standards

Input Standard	V_{REF} (Nom.)	V_{CCIO} ¹ (Nom.)
Single Ended Interfaces		
LVTTL	—	—
LVCMS33 ²	—	—
LVCMS25 ²	—	—

C1	I/O Capacitance ³	$V_{CCIO} = 3.3V, 2.5V, 1.8V, 1.5V, 1.2V, V_{CC} = 1.2V, V_{IO} = 0 \text{ to } V_{IH} (\text{MAX})$	—	8	—	pf
C2	Dedicated Input Capacitance ³	$V_{CCIO} = 3.3V, 2.5V, 1.8V, 1.5V, 1.2V, V_{CC} = 1.2V, V_{IO} = 0 \text{ to } V_{IH} (\text{MAX})$	—	8	—	pf

1. Input or I/O leakage current is measured with the pin configured as an input or as an I/O with the output driver tri-stated. It is not measured with the output driver active. Bus maintenance circuits are disabled.
2. Not applicable to SLEEPN/TOE pin.
3. $T_A = 25^\circ C$, $f = 1.0\text{MHz}$
4. When V_{IH} is higher than V_{CCIO} , a transient current typically of 30ns in duration or less with a peak current of 6mA can be expected on the high-to-low transition.

Supply Current (Sleep Mode)^{1, 2, 3}

1. Inputs on chip. Outputs are implemented with the addition of external resistors.

Differential HSTL and SSTL

Differential HSTL and SSTL outputs are implemented as a pair of complementary single-ended outputs. All allowable single-ended output classes (class I and class II) are supported in this mode.

LVDS25E

The top and bottom side of LatticeXP devices support LVDS outputs via emulated complementary LVCMS outputs in conjunction with a parallel resistor across the driver outputs. The scheme shown in Figure 3-1 is one possible solution for point-to-point signals.

Figure 3-1. LVDS25E Output Termination Example

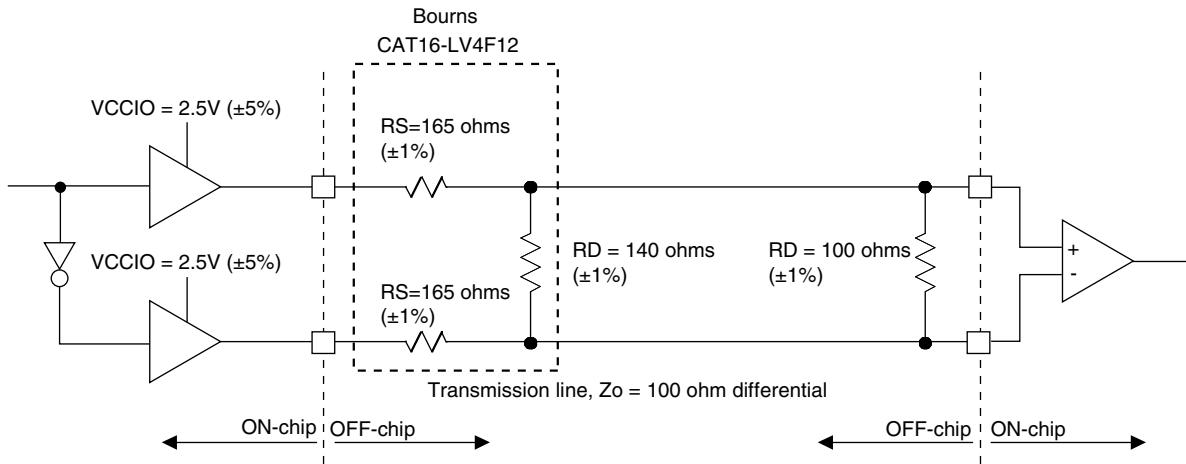

Table 3-1. LVDS25E DC Conditions

Over Recommended Operating Conditions

Parameter	Description	Typical	Units
V_{OH}	Output high voltage	1.43	V
V_{OL}	Output low voltage	1.07	V
V_{OD}	Output differential voltage	0.35	V
V_{CM}	Output common mode voltage	1.25	V
Z_{BACK}	Back impedance	100	ohms
I_{DC}	DC output current	3.66	mA

BLVDS

The LatticeXP devices support BLVDS standard. This standard is emulated using complementary LVCMS outputs in conjunction with a parallel external resistor across the driver outputs. BLVDS is intended for use when multi-drop and bi-directional multi-point differential signaling is required. The scheme shown in Figure 3-2 is one possible solution for bi-directional multi-point differential signals.

Figure 3-4. RSDS (Reduced Swing Differential Standard)**Table 3-4. RSDS DC Conditions**

Parameter	Description	Typical	Units
Z_{OUT}	Output impedance	20	ohms
R_S	Driver series resistor	300	ohms
R_P	Driver parallel resistor	121	ohms
R_T	Receiver termination	100	ohms
V_{OH}	Output high voltage	1.35	V
V_{OL}	Output low voltage	1.15	V
V_{OD}	Output differential voltage	0.20	V
V_{CM}	Output common mode voltage	1.25	V
Z_{BACK}	Back impedance	101.5	ohms
I_{DC}	DC output current	3.66	mA

Derating Logic Timing

Logic timing provided in the following sections of this data sheet and in the ispLEVER design tools are worst case numbers in the operating range. Actual delays at nominal temperature and voltage for best-case process can be much better than the values given in the tables. The ispLEVER design tool from Lattice can provide logic timing numbers at a particular temperature and voltage.

Switching Test Conditions

Figure 3-13 shows the output test load that is used for AC testing. The specific values for resistance, capacitance, voltage, and other test conditions are shown in Figure 3-5.

Figure 3-13. Output Test Load, LVTTL and LVC MOS Standards

Table 3-5. Test Fixture Required Components, Non-Terminated Interfaces

Test Condition	R ₁	C _L	Timing Ref.	V _T
LVTTL and other LVC MOS settings (L -> H, H -> L)	∞	0pF	LVC MOS 3.3 = V _{CCIO} /2	—
			LVC MOS 2.5 = V _{CCIO} /2	—
			LVC MOS 1.8 = V _{CCIO} /2	—
			LVC MOS 1.5 = V _{CCIO} /2	—
			LVC MOS 1.2 = V _{CCIO} /2	—
LVC MOS 2.5 I/O (Z -> H)	188	0pF	V _{CCIO} /2	V _{OL}
LVC MOS 2.5 I/O (Z -> L)			V _{CCIO} /2	V _{OH}
LVC MOS 2.5 I/O (H -> Z)			V _{OH} - 0.15	V _{OL}
LVC MOS 2.5 I/O (L -> Z)			V _{OL} + 0.15	V _{OH}

Note: Output test conditions for all other interfaces are determined by the respective standards.

1. Applies to LFXP "C" only.

2. Applies to LFXP "E" only.

3. Supports dedicated LVDS outputs.
