Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Details

Product Status	Obsolete
Number of LABs/CLBs	-
Number of Logic Elements/Cells	3000
Total RAM Bits	55296
Number of I/O	136
Number of Gates	-
Voltage - Supply	1.14V ~ 1.26V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	208-BFQFP
Supplier Device Package	208-PQFP (28x28)
Purchase URL	https://www.e-xfl.com/product-detail/lattice-semiconductor/lfxp3e-3q208c

Architecture Overview

The LatticeXP architecture contains an array of logic blocks surrounded by Programmable I/O Cells (PIC). Interspersed between the rows of logic blocks are rows of sysMEM Embedded Block RAM (EBR) as shown in Figure 2-1.

On the left and right sides of the PFU array, there are Non-volatile Memory Blocks. In configuration mode this non-volatile memory is programmed via the IEEE 1149.1 TAP port or the sysCONFIG™ peripheral port. On power up, the configuration data is transferred from the Non-volatile Memory Blocks to the configuration SRAM. With this technology, expensive external configuration memories are not required and designs are secured from unauthorized read-back. This transfer of data from non-volatile memory to configuration SRAM via wide busses happens in microseconds, providing an “instant-on” capability that allows easy interfacing in many applications.

There are two kinds of logic blocks, the Programmable Functional Unit (PFU) and Programmable Functional unit without RAM/ROM (PFF). The PFU contains the building blocks for logic, arithmetic, RAM, ROM and register functions. The PFF block contains building blocks for logic, arithmetic and ROM functions. Both PFU and PFF blocks are optimized for flexibility, allowing complex designs to be implemented quickly and efficiently. Logic Blocks are arranged in a two-dimensional array. Only one type of block is used per row. The PFU blocks are used on the outside rows. The rest of the core consists of rows of PFF blocks interspersed with rows of PFU blocks. For every three rows of PFF blocks there is a row of PFU blocks.

Each PIC block encompasses two PIOs (PIO pairs) with their respective sysIO interfaces. PIO pairs on the left and right edges of the device can be configured as LVDS transmit/receive pairs. sysMEM EBRs are large dedicated fast memory blocks. They can be configured as RAM or ROM.

The PFU, PFF, PIC and EBR Blocks are arranged in a two-dimensional grid with rows and columns as shown in Figure 2-1. The blocks are connected with many vertical and horizontal routing channel resources. The place and route software tool automatically allocates these routing resources.

At the end of the rows containing the sysMEM Blocks are the sysCLOCK Phase Locked Loop (PLL) Blocks. These PLLs have multiply, divide and phase shifting capability; they are used to manage the phase relationship of the clocks. The LatticeXP architecture provides up to four PLLs per device.

Every device in the family has a JTAG Port with internal Logic Analyzer (ispTRACY) capability. The sysCONFIG port which allows for serial or parallel device configuration. The LatticeXP devices are available for operation from 3.3V, 2.5V, 1.8V and 1.2V power supplies, providing easy integration into the overall system.

For more information on the PLL, please see details of additional technical documentation at the end of this data sheet.

Dynamic Clock Select (DCS)

The DCS is a global clock buffer with smart multiplexer functions. It takes two independent input clock sources and outputs a clock signal without any glitches or runt pulses. This is achieved irrespective of where the select signal is toggled. There are eight DCS blocks per device, located in pairs at the center of each side. Figure 2-12 illustrates the DCS Block Macro.

Figure 2-12. DCS Block Primitive

Figure 2-13 shows timing waveforms of the default DCS operating mode. The DCS block can be programmed to other modes. For more information on the DCS, please see details of additional technical documentation at the end of this data sheet.

Figure 2-13. DCS Waveforms

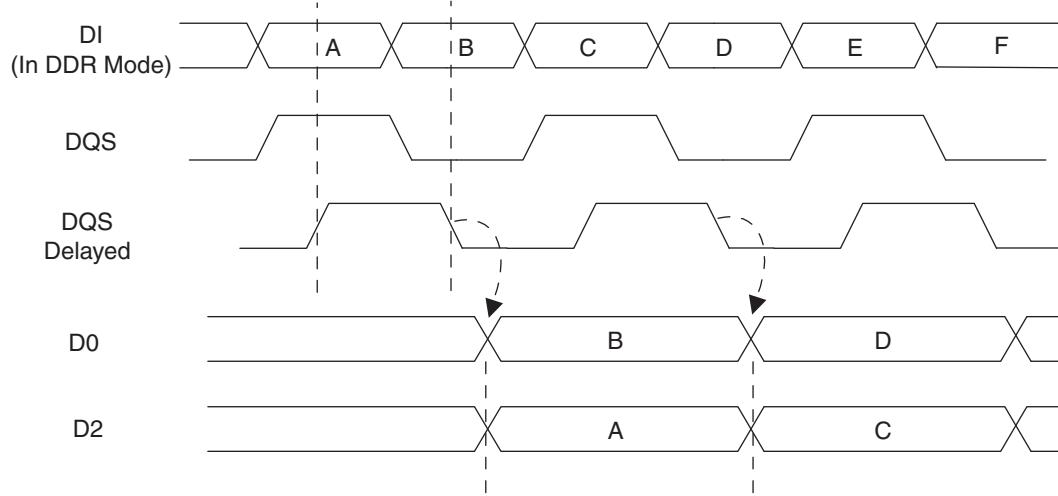

sysMEM Memory

The LatticeXP family of devices contain a number of sysMEM Embedded Block RAM (EBR). The EBR consists of a 9-Kbit RAM, with dedicated input and output registers.

sysMEM Memory Block

The sysMEM block can implement single port, dual port or pseudo dual port memories. Each block can be used in a variety of depths and widths as shown in Table 2-6.

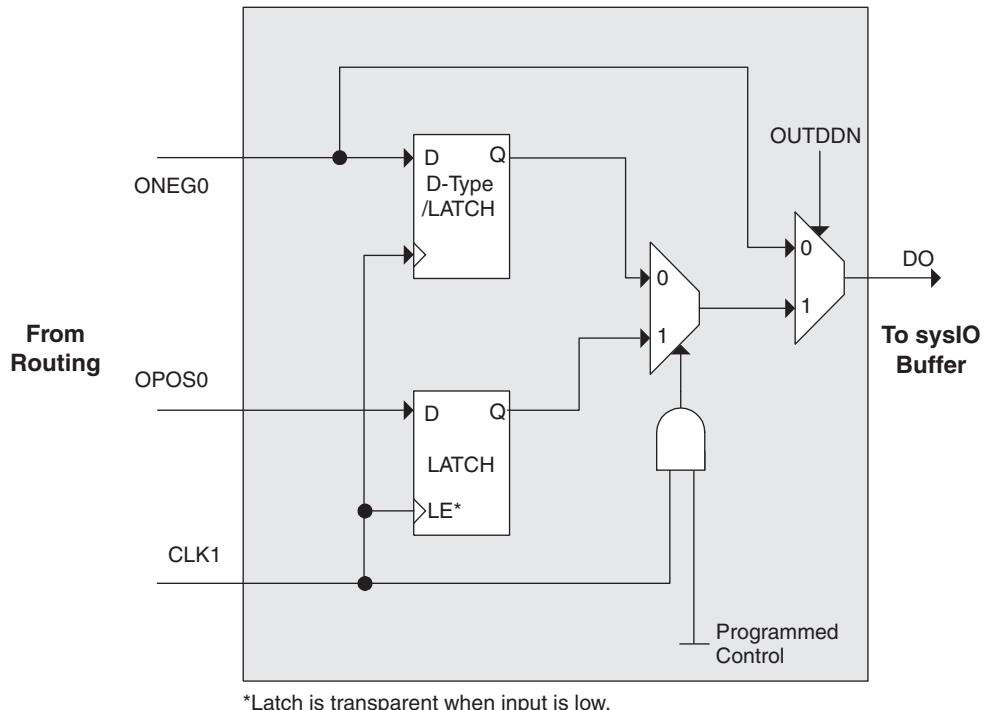

Figure 2-21. Input Register DDR Waveforms**Figure 2-22. INDDRXB Primitive**

Output Register Block

The output register block provides the ability to register signals from the core of the device before they are passed to the sysIO buffers. The block contains a register for SDR operation that is combined with an additional latch for DDR operation. Figure 2-23 shows the diagram of the Output Register Block.

In SDR mode, ONEG0 feeds one of the flip-flops that then feeds the output. The flip-flop can be configured as a D-type or as a latch. In DDR mode, ONEG0 is fed into one register on the positive edge of the clock and OPOS0 is latched. A multiplexer running off the same clock selects the correct register for feeding to the output (D0).

Figure 2-24 shows the design tool DDR primitives. The SDR output register has reset and clock enable available. The additional register for DDR operation does not have reset or clock enable available.

Figure 2-23. Output Register Block**Figure 2-24. ODDRXB Primitive****Tristate Register Block**

The tristate register block provides the ability to register tri-state control signals from the core of the device before they are passed to the sysIO buffers. The block contains a register for SDR operation and an additional latch for DDR operation. Figure 2-25 shows the diagram of the Tristate Register Block.

In SDR mode, ONEG1 feeds one of the flip-flops that then feeds the output. The flip-flop can be configured a D-type or latch. In DDR mode, ONEG1 is fed into one register on the positive edge of the clock and OPOS1 is latched. A multiplexer running off the same clock selects the correct register for feeding to the output (D0).

sysIO Differential Electrical Characteristics**LVDS****Over Recommended Operating Conditions**

Parameter Symbol	Parameter Description	Test Conditions	Min.	Typ.	Max.	Units
V_{INP}, V_{INM}	Input Voltage		0	—	2.4	V
V_{THD}	Differential Input Threshold		+/-100	—	—	mV
V_{CM}	Input Common Mode Voltage	$100\text{mV} \leq V_{THD}$	$V_{THD}/2$	1.2	1.8	V
		$200\text{mV} \leq V_{THD}$	$V_{THD}/2$	1.2	1.9	V
		$350\text{mV} \leq V_{THD}$	$V_{THD}/2$	1.2	2.0	V
I_{IN}	Input current	Power on or power off	—	—	+/-10	μA
V_{OH}	Output high voltage for V_{OP} or V_{OM}	$R_T = 100$ ohms	—	1.38	1.60	V
V_{OL}	Output low voltage for V_{OP} or V_{OM}	$R_T = 100$ ohms	0.9V	1.03	—	V
V_{OD}	Output voltage differential	$(V_{OP} - V_{OM}), R_T = 100$ ohms	250	350	450	mV
ΔV_{OD}	Change in V_{OD} between high and low		—	—	50	mV
V_{OS}	Output voltage offset	$(V_{OP} - V_{OM})/2, R_T = 100$ ohms	1.125	1.25	1.375	V
ΔV_{OS}	Change in V_{OS} between H and L		—	—	50	mV
I_{OSD}	Output short circuit current	$V_{OD} = 0\text{V}$ Driver outputs shorted	—	—	6	mA

Switching Test Conditions

Figure 3-13 shows the output test load that is used for AC testing. The specific values for resistance, capacitance, voltage, and other test conditions are shown in Figure 3-5.

Figure 3-13. Output Test Load, LVTTL and LVC MOS Standards

Table 3-5. Test Fixture Required Components, Non-Terminated Interfaces

Test Condition	R ₁	C _L	Timing Ref.	V _T
LVTTL and other LVC MOS settings (L -> H, H -> L)	∞	0pF	LVC MOS 3.3 = V _{CCIO} /2	—
			LVC MOS 2.5 = V _{CCIO} /2	—
			LVC MOS 1.8 = V _{CCIO} /2	—
			LVC MOS 1.5 = V _{CCIO} /2	—
			LVC MOS 1.2 = V _{CCIO} /2	—
LVC MOS 2.5 I/O (Z -> H)	188	0pF	V _{CCIO} /2	V _{OL}
LVC MOS 2.5 I/O (Z -> L)			V _{CCIO} /2	V _{OH}
LVC MOS 2.5 I/O (H -> Z)			V _{OH} - 0.15	V _{OL}
LVC MOS 2.5 I/O (L -> Z)			V _{OL} + 0.15	V _{OH}

Note: Output test conditions for all other interfaces are determined by the respective standards.

1. Applies to LFXP "C" only.

2. Applies to LFXP "E" only.

3. Supports dedicated LVDS outputs.

LFXP15 & LFXP20 Logic Signal Connections: 484 fpBGA

LatticeXP Family Data Sheet

Ordering Information

December 2005

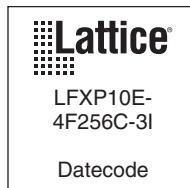

Data Sheet DS1001

Part Number Description

Ordering Information (Contact Factory for Specific Device Availability)

Note: LatticeXP devices are dual marked. For example, the commercial speed grade LFXP10E-4F256C is also marked with industrial grade -3I (LFXP10E-3F256I). The commercial grade is one speed grade faster than the associated dual mark industrial grade. The slowest commercial speed grade does not have industrial markings. The markings appear as follows:

Commercial (Cont.)

Part Number	I/Os	Voltage	Grade	Package	Pins	Temp.	LUTs
