### Understanding **Embedded - FPGAs (Field Programmable Gate Array)**

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### **Applications of Embedded - FPGAs**

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

#### **Details**

Product Status	Obsolete
Number of LABs/CLBs	-
Number of Logic Elements/Cells	3000
Total RAM Bits	55296
Number of I/O	62
Number of Gates	-
Voltage - Supply	1.14V ~ 1.26V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	100-LQFP
Supplier Device Package	100-TQFP (14x14)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/lattice-semiconductor/lfxp3e-3t100c">https://www.e-xfl.com/product-detail/lattice-semiconductor/lfxp3e-3t100c</a>

## Introduction

The LatticeXP family of FPGA devices combine logic gates, embedded memory and high performance I/Os in a single architecture that is both non-volatile and infinitely reconfigurable to support cost-effective system designs.

The re-programmable non-volatile technology used in the LatticeXP family is the next generation ispXP™ technology. With this technology, expensive external configuration memories are not required and designs are secured from unauthorized read-back. In addition, instant-on capability allows for easy interfacing in many applications.

The ispLEVER® design tool from Lattice allows large complex designs to be efficiently implemented using the LatticeXP family of FPGA devices. Synthesis library support for LatticeXP is available for popular logic synthesis tools. The ispLEVER tool uses the synthesis tool output along with the constraints from its floor planning tools to place and route the design in the LatticeXP device. The ispLEVER tool extracts the timing from the routing and back-annotates it into the design for timing verification.

Lattice provides many pre-designed IP (Intellectual Property) ispLeverCORE™ modules for the LatticeXP family. By using these IPs as standardized blocks, designers are free to concentrate on the unique aspects of their design, increasing their productivity.

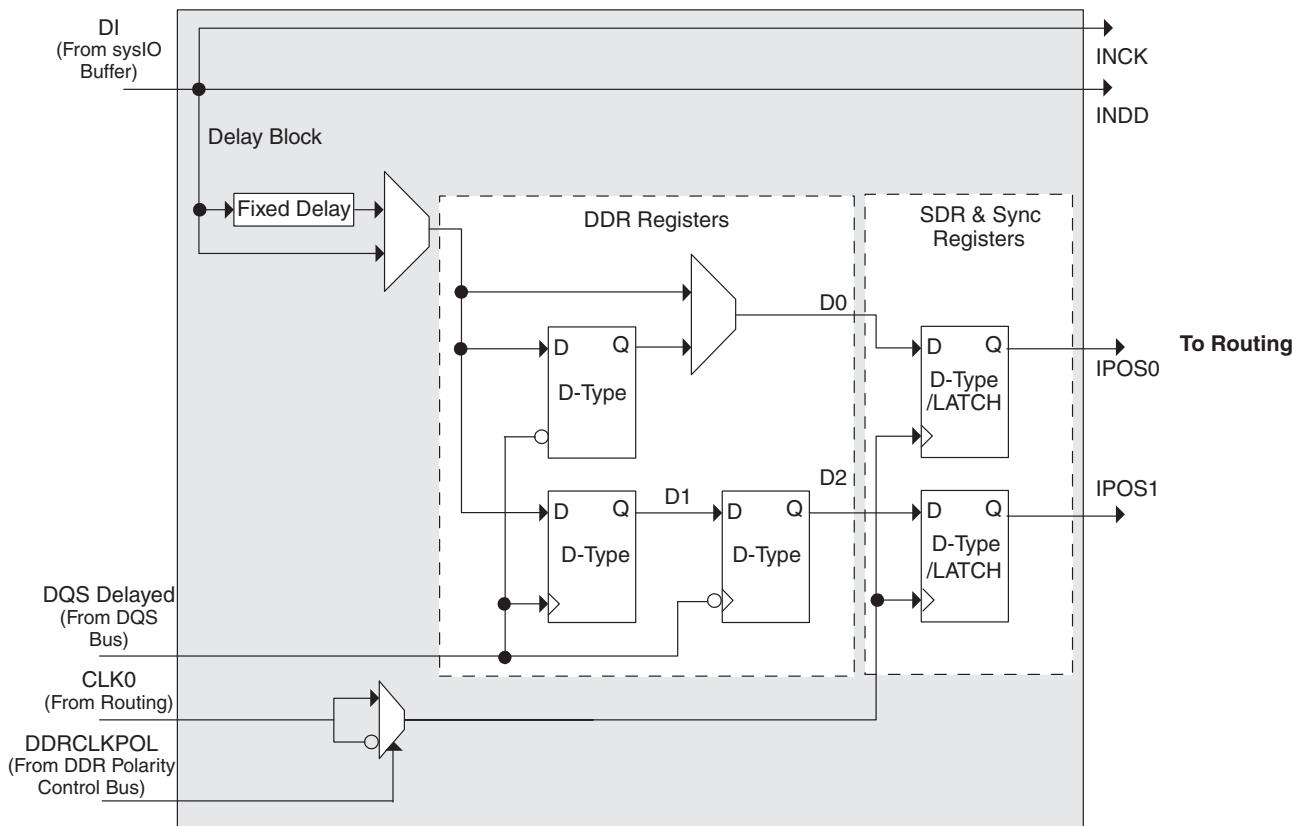

in selected blocks the input to the DQS delay block. If one of the bypass options is not chosen, the signal first passes through an optional delay block. This delay, if selected, ensures no positive input-register hold-time requirement when using a global clock.

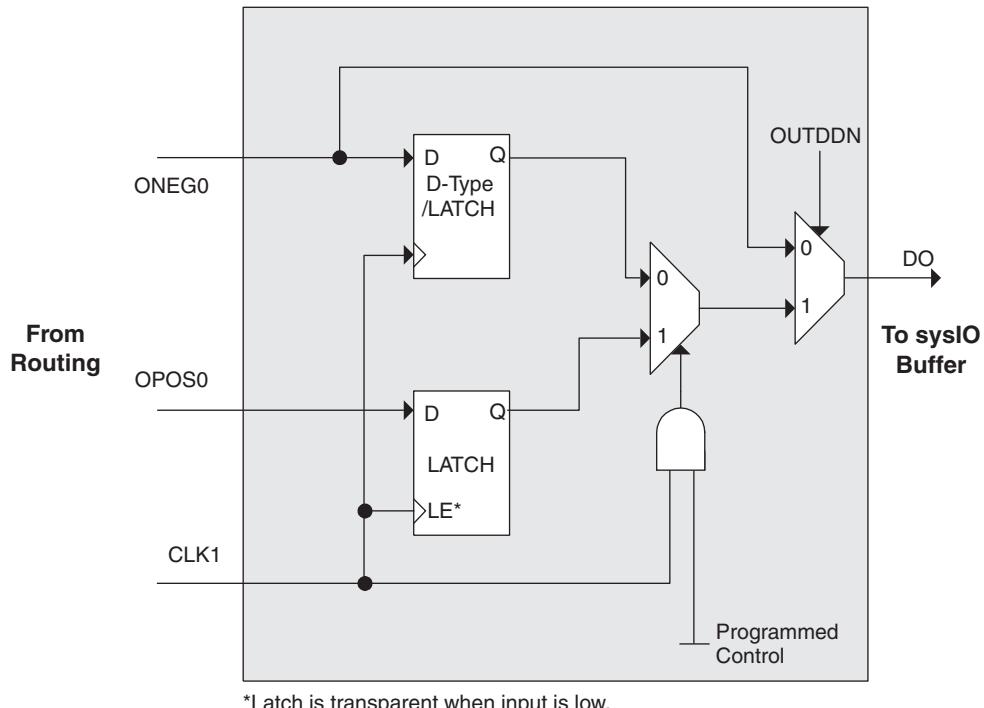

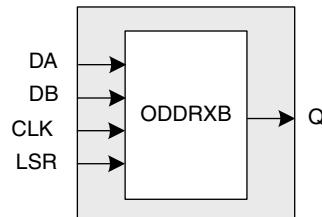

The input block allows two modes of operation. In the single data rate (SDR) the data is registered, by one of the registers in the single data rate sync register block, with the system clock. In the DDR Mode two registers are used to sample the data on the positive and negative edges of the DQS signal creating two data streams, D0 and D2. These two data streams are synchronized with the system clock before entering the core. Further discussion on this topic is in the DDR Memory section of this data sheet.

Figure 2-21 shows the input register waveforms for DDR operation and Figure 2-22 shows the design tool primitives. The SDR/SYNC registers have reset and clock enable available.

The signal DDRCLKPOL controls the polarity of the clock used in the synchronization registers. It ensures adequate timing when data is transferred from the DQS to the system clock domain. For further discussion of this topic, see the DDR memory section of this data sheet.

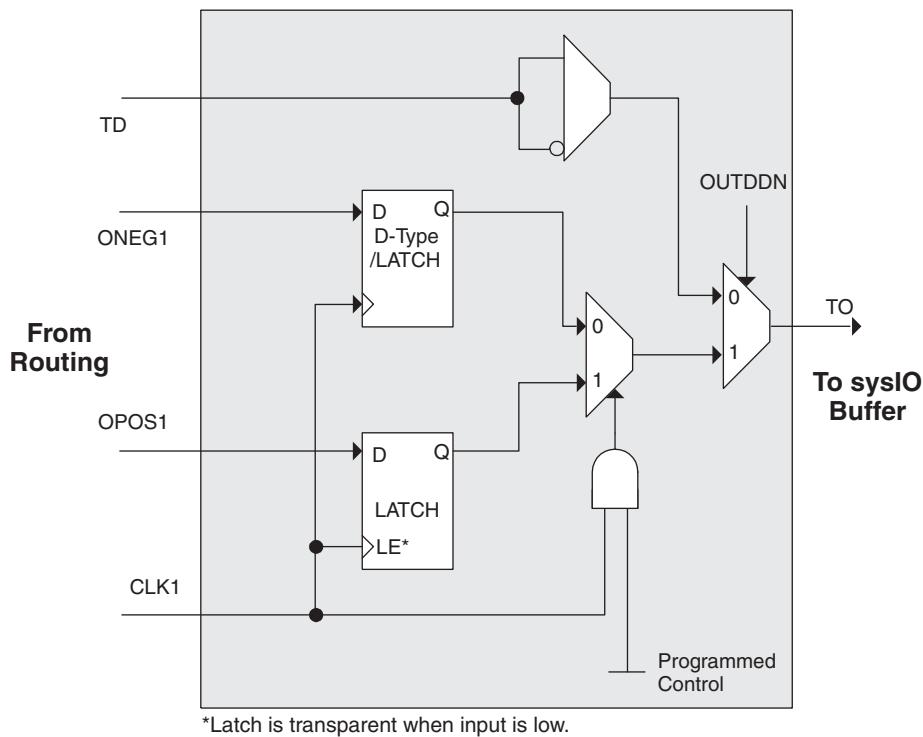

**Figure 2-20. Input Register Diagram**

**Figure 2-23. Output Register Block****Figure 2-24. ODDRXB Primitive****Tristate Register Block**

The tristate register block provides the ability to register tri-state control signals from the core of the device before they are passed to the sysIO buffers. The block contains a register for SDR operation and an additional latch for DDR operation. Figure 2-25 shows the diagram of the Tristate Register Block.

In SDR mode, ONEG1 feeds one of the flip-flops that then feeds the output. The flip-flop can be configured a D-type or latch. In DDR mode, ONEG1 is fed into one register on the positive edge of the clock and OPOS1 is latched. A multiplexer running off the same clock selects the correct register for feeding to the output (D0).

**Figure 2-25. Tristate Register Block**

### Control Logic Block

The control logic block allows the selection and modification of control signals for use in the PIO block. A clock is selected from one of the clock signals provided from the general purpose routing and a DQS signal provided from the programmable DQS pin. The clock can optionally be inverted.

The clock enable and local reset signals are selected from the routing and optionally inverted. The global tristate signal is passed through this block.

### DDR Memory Support

Implementing high performance DDR memory interfaces requires dedicated DDR register structures in the input (for read operations) and in the output (for write operations). As indicated in the PIO Logic section, the LatticeXP devices provide this capability. In addition to these registers, the LatticeXP devices contain two elements to simplify the design of input structures for read operations: the DQS delay block and polarity control logic.

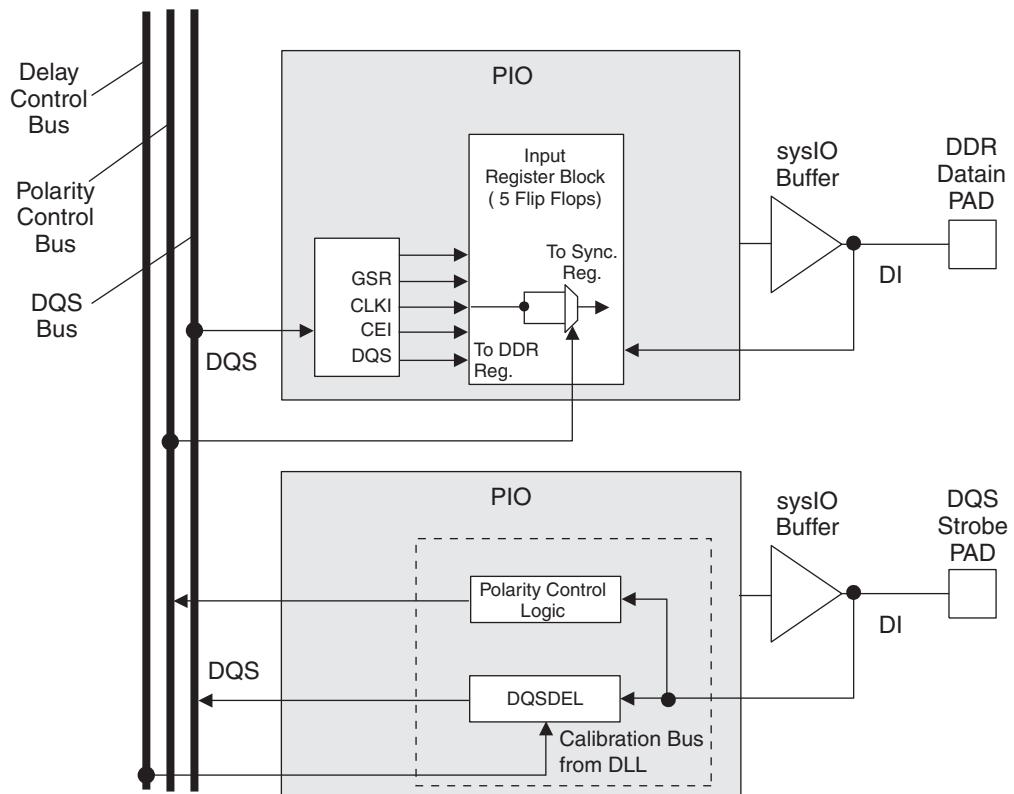

### DLL Calibrated DQS Delay Block

Source Synchronous interfaces generally require the input clock to be adjusted in order to correctly capture data at the input register. For most interfaces a PLL is used for this adjustment, however in DDR memories the clock (referred to as DQS) is not free running so this approach cannot be used. The DQS Delay block provides the required clock alignment for DDR memory interfaces.

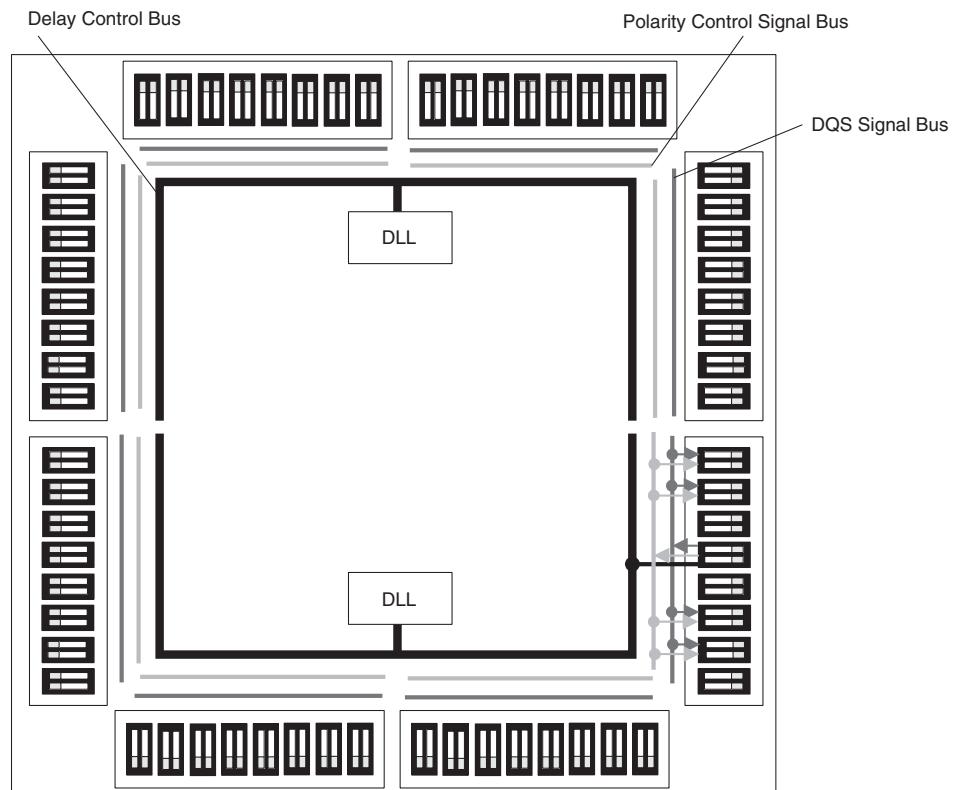

The DQS signal (selected PIOs only) feeds from the PAD through a DQS delay element to a dedicated DQS routing resource. The DQS signal also feeds the polarity control logic which controls the polarity of the clock to the sync registers in the input register blocks. Figures 2-26 and 2-27 show how the polarity control logic are routed to the PIOs.

The temperature, voltage and process variations of the DQS delay block are compensated by a set of calibration (6-bit bus) signals from two DLLs on opposite sides of the device. Each DLL compensates DQS Delays in its half of the device as shown in Figure 2-27. The DLL loop is compensated for temperature, voltage and process variations by the system clock and feedback loop.

**Figure 2-26. DQS Local Bus**

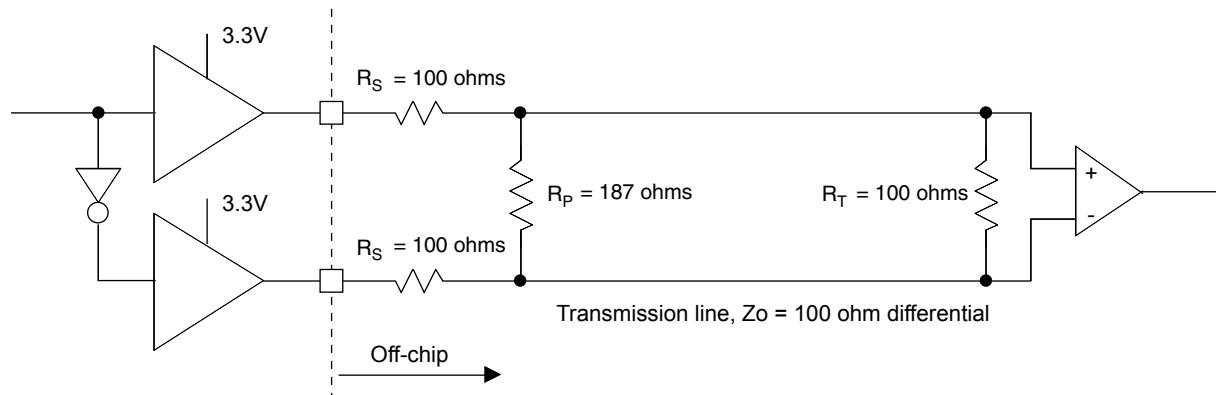

**Figure 2-27. DLL Calibration Bus and DQS/DQS Transition Distribution**

**LVPECL**

The LatticeXP devices support differential LVPECL standard. This standard is emulated using complementary LVC MOS outputs in conjunction with a parallel resistor across the driver outputs. The LVPECL input standard is supported by the LVDS differential input buffer. The scheme shown in Figure 3-3 is one possible solution for point-to-point signals.

**Figure 3-3. Differential LVPECL****Table 3-3. LVPECL DC Conditions<sup>1</sup>****Over Recommended Operating Conditions**

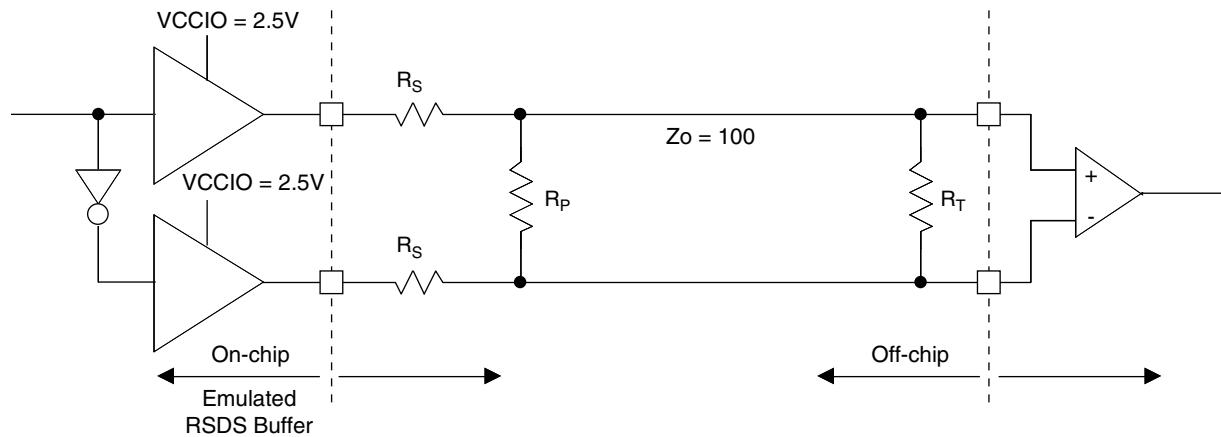

Symbol	Description	Typical	Units
$Z_{OUT}$	Output impedance	100	ohms
$R_P$	Driver parallel resistor	187	ohms
$R_S$	Driver series resistor	100	ohms
$R_T$	Receiver termination	100	ohms
$V_{OH}$	Output high voltage	2.03	V
$V_{OL}$	Output low voltage	1.27	V
$V_{OD}$	Output differential voltage	0.76	V
$V_{CM}$	Output common mode voltage	1.65	V
$Z_{BACK}$	Back impedance	85.7	ohms
$I_{DC}$	DC output current	12.7	mA

1. For input buffer, see LVDS table.

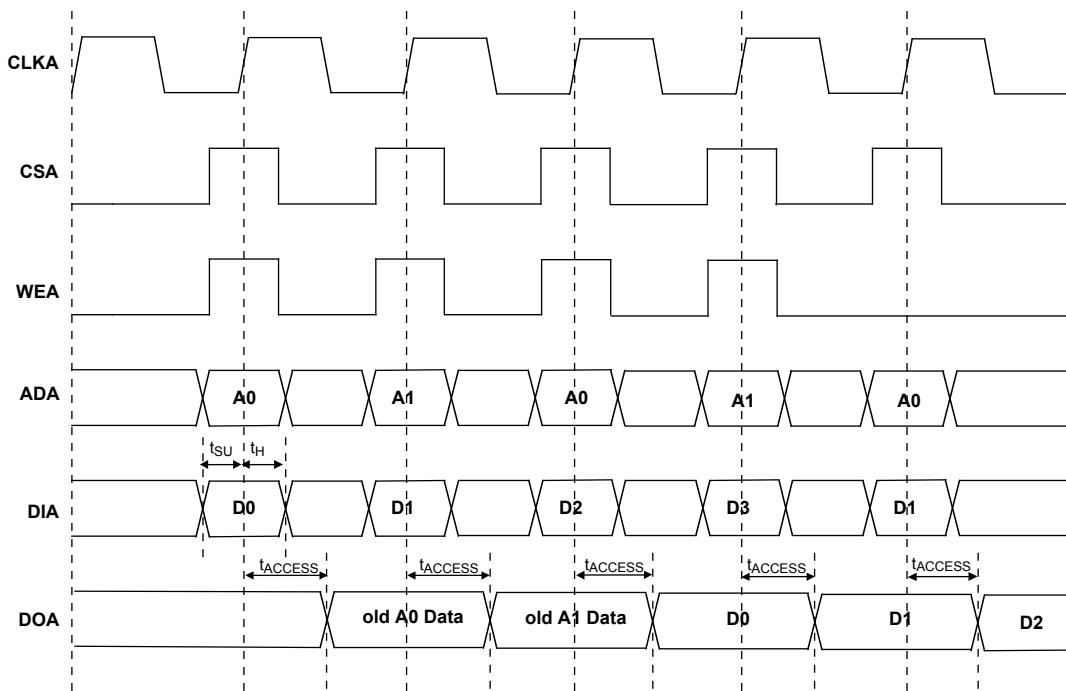

For further information on LVPECL, BLVDS and other differential interfaces please see details of additional technical documentation at the end of the data sheet.

**RSDS**

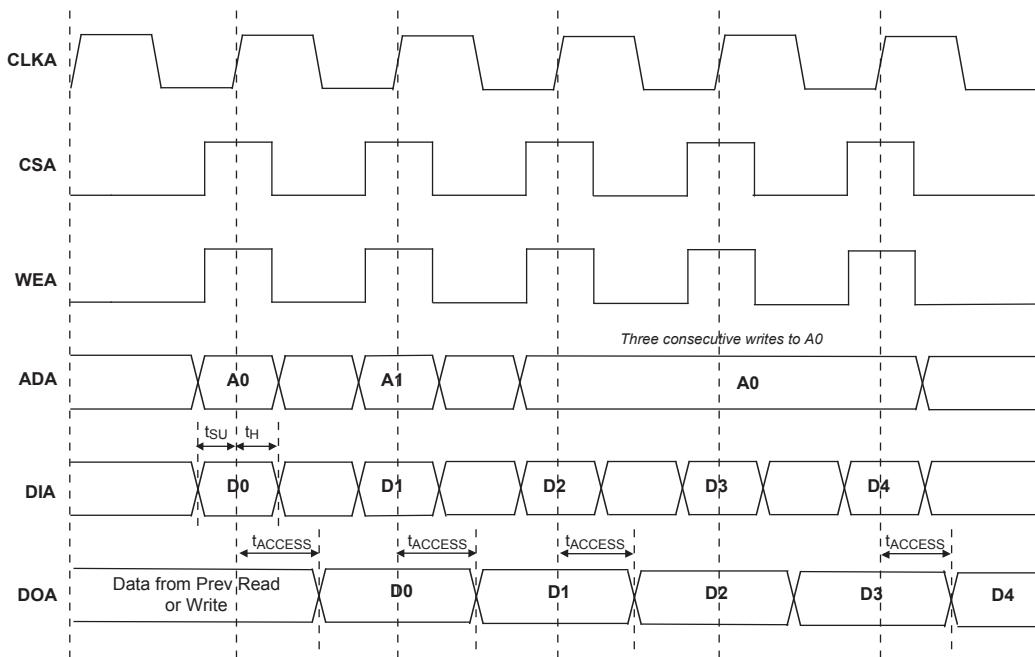

The LatticeXP devices support differential RSDS standard. This standard is emulated using complementary LVC MOS outputs in conjunction with a parallel resistor across the driver outputs. The RSDS input standard is supported by the LVDS differential input buffer. The scheme shown in Figure 3-4 is one possible solution for RSDS standard implementation. Use LVDS25E mode with suggested resistors for RSDS operation. Resistor values in Figure 3-4 are industry standard values for 1% resistors.

**Figure 3-4. RSDS (Reduced Swing Differential Standard)****Table 3-4. RSDS DC Conditions**

Parameter	Description	Typical	Units
$Z_{OUT}$	Output impedance	20	ohms
$R_S$	Driver series resistor	300	ohms
$R_P$	Driver parallel resistor	121	ohms
$R_T$	Receiver termination	100	ohms
$V_{OH}$	Output high voltage	1.35	V
$V_{OL}$	Output low voltage	1.15	V
$V_{OD}$	Output differential voltage	0.20	V
$V_{CM}$	Output common mode voltage	1.25	V
$Z_{BACK}$	Back impedance	101.5	ohms
$I_{DC}$	DC output current	3.66	mA

**Figure 3-10. Read Before Write (SP Read/Write on Port A, Input Registers Only)**

Note: Input data and address are registered at the positive edge of the clock and output data appears after the positive of the clock.

**Figure 3-11. Write Through (SP Read/Write On Port A, Input Registers Only)**

Note: Input data and address are registered at the positive edge of the clock and output data appears after the positive of the clock.

## sysCLOCK PLL Timing

### Over Recommended Operating Conditions

Parameter	Descriptions	Conditions	Min.	Typ.	Max.	Units
$f_{IN}$	Input Clock Frequency (CLKI, CLKFB)		25	—	375	MHz
$f_{OUT}$	Output Clock Frequency (CLKOP, CLKOS)		25	—	375	MHz
$f_{OUT2}$	K-Divider Output Frequency (CLKOK)		0.195	—	187.5	MHz
$f_{VCO}$	PLL VCO Frequency		375	—	750	MHz
$f_{PFD}$	Phase Detector Input Frequency		25	—	—	MHz
<b>AC Characteristics</b>						
$t_{DT}$	Output Clock Duty Cycle	Default duty cycle elected <sup>3</sup>	45	50	55	%
$t_{PH}^4$	Output Phase Accuracy		—	—	0.05	UI
$t_{OPJIT}^1$	Output Clock Period Jitter	$f_{OUT} \geq 100\text{MHz}$	—	—	+/- 125	ps
		$f_{OUT} < 100\text{MHz}$	—	—	0.02	UIPP
$t_{SK}$	Input Clock to Output Clock Skew	Divider ratio = integer	—	—	+/- 200	ps
$t_W$	Output Clock Pulse Width	At 90% or 10% <sup>3</sup>	1	—	—	ns
$t_{LOCK}^2$	PLL Lock-in Time		—	—	150	us
$t_{PA}$	Programmable Delay Unit		100	250	400	ps
$t_{IPJIT}$	Input Clock Period Jitter		—	—	+/- 200	ps
$t_{FBKDLY}$	External Feedback Delay		—	—	10	ns
$t_{HI}$	Input Clock High Time	90% to 90%	0.5	—	—	ns
$t_{LO}$	Input Clock Low Time	10% to 10%	0.5	—	—	ns
$t_{RST}$	RST Pulse Width		10	—	—	ns

1. Jitter sample is taken over 10,000 samples of the primary PLL output with clean reference clock.

2. Output clock is valid after  $t_{LOCK}$  for PLL reset and dynamic delay adjustment.

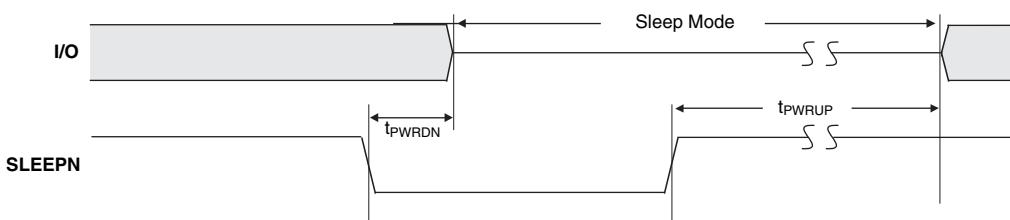

3. Using LVDS output buffers.

4. As compared to CLKOP output.

Timing v.F0.11

## LatticeXP “C” Sleep Mode Timing

Parameter	Descriptions	Min.	Typ.	Max.	Units	
$t_{PWRDN}$	SLEEPN Low to I/O Tristate	—	20	32	ns	
$t_{PWRUP}$	SLEEPN High to Power Up	LFXP3	—	1.4	2.1	ms

1. Applies to LFXP "C" only.
2. Applies to LFXP "E" only.
3. Supports dedicated LVDS outputs.

**LFXP10, LFXP15 & LFXP20 Logic Signal Connections: 388 fpBGA (Cont.)**

# LatticeXP Family Data Sheet

## Revision History

November 2007

Data Sheet DS1001

### Revision History

Date	Version	Section	Change Summary
February 2005	01.0	—	Initial release.
April 2005	01.1	Architecture	EBR memory support section updated with clarification.
May 2005	01.2	Introduction	Added TransFR Reconfiguration to Features section.
		Architecture	Added TransFR section.
June 2005	01.3	Pinout Information	Added pinout information for LFXP3, LFXP6, LFXP15 and LFXP20.
July 2005	02.0	Introduction	Updated XP6, XP15 and XP20 EBR SRAM Bits and Block numbers.
		Architecture	Updated Per Quadrant Primary Clock Selection figure.
			Added Typical I/O Behavior During Power-up section.
			Updated Device Configuration section under Configuration and Testing.
		DC and Switching Characteristics	Clarified Hot Socketing Specification
			Updated Supply Current (Standby) Table
			Updated Initialization Supply Current Table
			Added Programming and Erase Flash Supply Current table
			Added LVDS Emulation section. Updated LVDS25E Output Termination Example figure and LVDS25E DC Conditions table.
			Updated Differential LVPECL diagram and LVPECL DC Conditions table.
			Deleted 5V Tolerant Input Buffer section. Updated RSDS figure and RSDS DC Conditions table.
			Updated sysCONFIG Port Timing Specifications
			Updated JTAG Port Timing Specifications. Added Flash Download Time table.
		Pinout Information	Updated Signal Descriptions table.
			Updated Logic Signal Connections Dual Function column.
		Ordering Information	Added lead-free ordering part numbers.
July 2005	02.1	DC and Switching Characteristics	Clarification of Flash Programming Junction Temperature
August 2005	02.2	Introduction	Added Sleep Mode feature.
		Architecture	Added Sleep Mode section.
		DC and Switching Characteristics	Added Sleep Mode Supply Current Table
			Added Sleep Mode Timing section
		Pinout Information	Added SLEEPN and TOE signal names, descriptions and footnotes.
			Added SLEEPN and TOE to pinout information and footnotes.
			Added footnote 3 to Logic Signal Connections tables for clarification on emulated LVDS output.
September 2005	03.0	Architecture	Added clarification of PCI clamp.
			Added clarification to SLEEPN Pin Characteristics section.
		DC and Switching Characteristics	DC Characteristics, added footnote 4 for clarification. Updated Supply Current (Sleep Mode), Supply Current (Standby), Initialization Supply Current, and Programming and Erase Flash Supply Current typical numbers.
