### Understanding **Embedded - FPGAs (Field Programmable Gate Array)**

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### **Applications of Embedded - FPGAs**

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

#### **Details**

Product Status	Obsolete
Number of LABs/CLBs	-
Number of Logic Elements/Cells	3000
Total RAM Bits	55296
Number of I/O	100
Number of Gates	-
Voltage - Supply	1.14V ~ 1.26V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	144-LQFP
Supplier Device Package	144-TQFP (20x20)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/lattice-semiconductor/lfxp3e-3t144c">https://www.e-xfl.com/product-detail/lattice-semiconductor/lfxp3e-3t144c</a>

## Introduction

The LatticeXP family of FPGA devices combine logic gates, embedded memory and high performance I/Os in a single architecture that is both non-volatile and infinitely reconfigurable to support cost-effective system designs.

The re-programmable non-volatile technology used in the LatticeXP family is the next generation ispXP™ technology. With this technology, expensive external configuration memories are not required and designs are secured from unauthorized read-back. In addition, instant-on capability allows for easy interfacing in many applications.

The ispLEVER® design tool from Lattice allows large complex designs to be efficiently implemented using the LatticeXP family of FPGA devices. Synthesis library support for LatticeXP is available for popular logic synthesis tools. The ispLEVER tool uses the synthesis tool output along with the constraints from its floor planning tools to place and route the design in the LatticeXP device. The ispLEVER tool extracts the timing from the routing and back-annotates it into the design for timing verification.

Lattice provides many pre-designed IP (Intellectual Property) ispLeverCORE™ modules for the LatticeXP family. By using these IPs as standardized blocks, designers are free to concentrate on the unique aspects of their design, increasing their productivity.

**Figure 2-25. Tristate Register Block**

### Control Logic Block

The control logic block allows the selection and modification of control signals for use in the PIO block. A clock is selected from one of the clock signals provided from the general purpose routing and a DQS signal provided from the programmable DQS pin. The clock can optionally be inverted.

The clock enable and local reset signals are selected from the routing and optionally inverted. The global tristate signal is passed through this block.

### DDR Memory Support

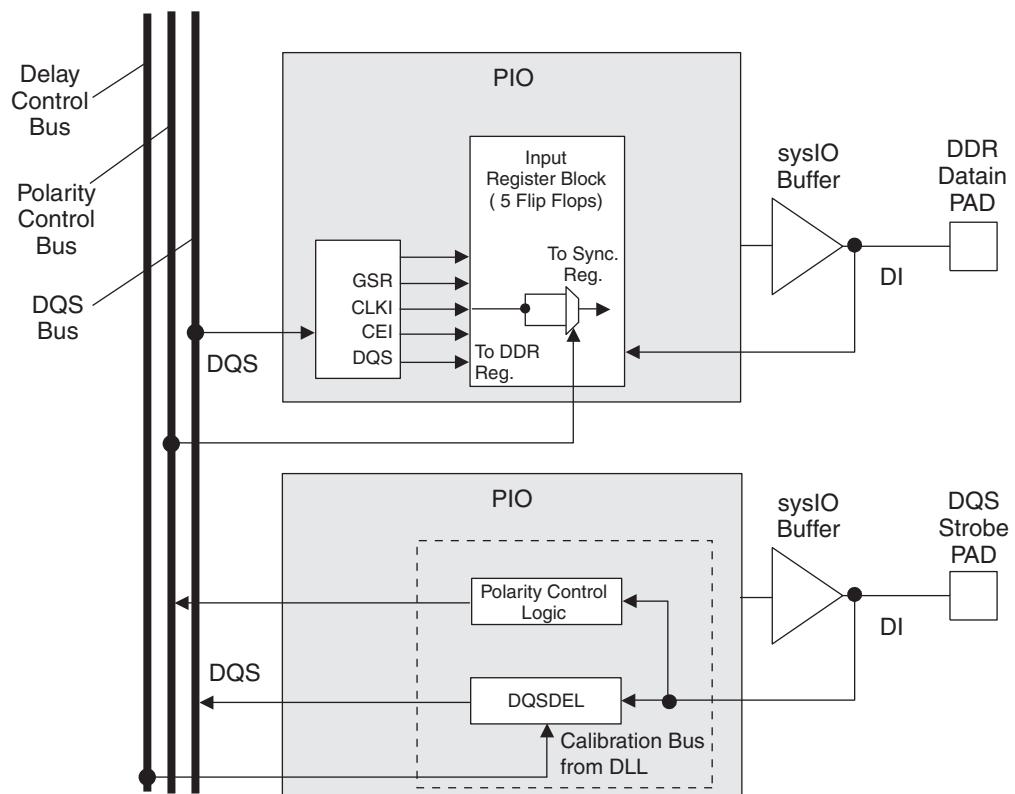

Implementing high performance DDR memory interfaces requires dedicated DDR register structures in the input (for read operations) and in the output (for write operations). As indicated in the PIO Logic section, the LatticeXP devices provide this capability. In addition to these registers, the LatticeXP devices contain two elements to simplify the design of input structures for read operations: the DQS delay block and polarity control logic.

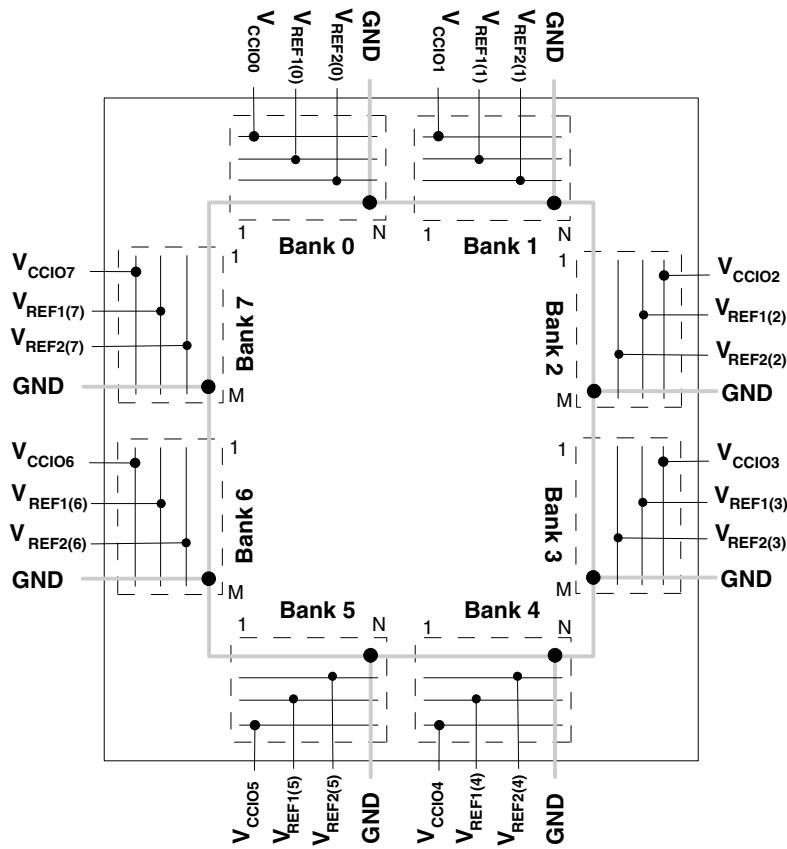

### DLL Calibrated DQS Delay Block

Source Synchronous interfaces generally require the input clock to be adjusted in order to correctly capture data at the input register. For most interfaces a PLL is used for this adjustment, however in DDR memories the clock (referred to as DQS) is not free running so this approach cannot be used. The DQS Delay block provides the required clock alignment for DDR memory interfaces.

The DQS signal (selected PIOs only) feeds from the PAD through a DQS delay element to a dedicated DQS routing resource. The DQS signal also feeds the polarity control logic which controls the polarity of the clock to the sync registers in the input register blocks. Figures 2-26 and 2-27 show how the polarity control logic are routed to the PIOs.

The temperature, voltage and process variations of the DQS delay block are compensated by a set of calibration (6-bit bus) signals from two DLLs on opposite sides of the device. Each DLL compensates DQS Delays in its half of the device as shown in Figure 2-27. The DLL loop is compensated for temperature, voltage and process variations by the system clock and feedback loop.

**Figure 2-26. DQS Local Bus****Figure 2-27. DLL Calibration Bus and DQS/DQS Transition Distribution**

**Figure 2-28. LatticeXP Banks**

Note: N and M are the maximum number of I/Os per bank.

LatticeXP devices contain two types of sysIO buffer pairs.

#### 1. Top and Bottom sysIO Buffer Pair (Single-Ended Outputs Only)

The sysIO buffer pairs in the top and bottom banks of the device consist of two single-ended output drivers and two sets of single-ended input buffers (both ratioed and referenced). The referenced input buffer can also be configured as a differential input.

The two pads in the pair are described as “true” and “comp”, where the true pad is associated with the positive side of the differential input buffer and the comp (complementary) pad is associated with the negative side of the differential input buffer.

Only the I/Os on the top and bottom banks have PCI clamps. Note that the PCI clamp is enabled after  $V_{CC}$ ,  $V_{CCAUX}$  and  $V_{CCIO}$  are at valid operating levels and the device has been configured.

#### 2. Left and Right sysIO Buffer Pair (Differential and Single-Ended Outputs)

The sysIO buffer pairs in the left and right banks of the device consist of two single-ended output drivers, two sets of single-ended input buffers (both ratioed and referenced) and one differential output driver. The referenced input buffer can also be configured as a differential input. In these banks the two pads in the pair are described as “true” and “comp”, where the true pad is associated with the positive side of the differential I/O, and the comp (complementary) pad is associated with the negative side of the differential I/O.

Select I/Os in the left and right banks have LVDS differential output drivers. Refer to the Logic Signal Connections tables for more information.

master serial clock is 2.5MHz. Table 2-10 lists all the available Master Serial Clock frequencies. When a different Master Serial Clock is selected during the design process, the following sequence takes place:

1. User selects a different Master Serial Clock frequency for configuration.
2. During configuration the device starts with the default (2.5MHz) Master Serial Clock frequency.
3. The clock configuration settings are contained in the early configuration bit stream.
4. The Master Serial Clock frequency changes to the selected frequency once the clock configuration bits are received.

For further information on the use of this oscillator for configuration, please see details of additional technical documentation at the end of this data sheet.

**Table 2-10. Selectable Master Serial Clock (CCLK) Frequencies During Configuration**

CCLK (MHz)	CCLK (MHz)	CCLK (MHz)
2.5 <sup>1</sup>	13	45
4.3	15	51
5.4	20	55
6.9	26	60
8.1	30	130
9.2	34	—
10.0	41	—

1. Default

## Density Shifting

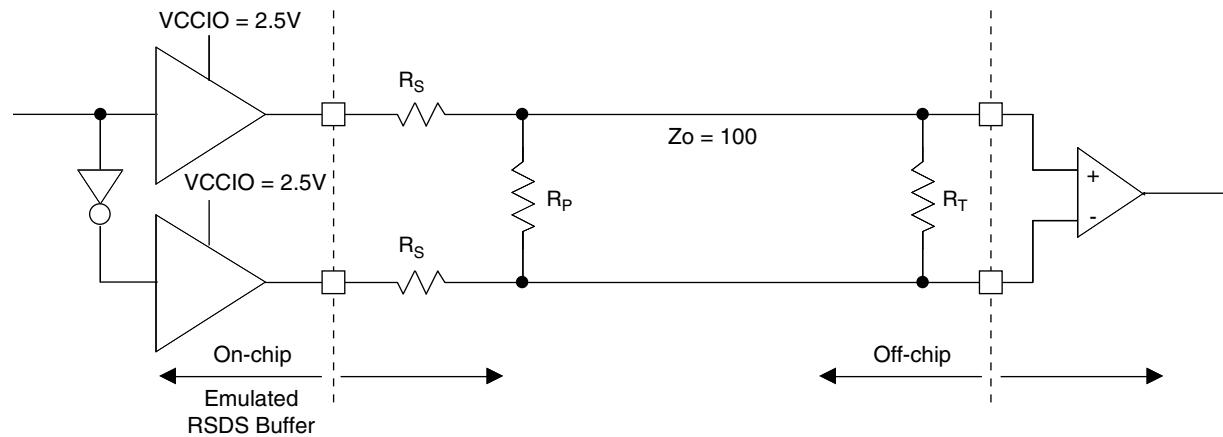

The LatticeXP family has been designed to ensure that different density devices in the same package have the same pin-out. Furthermore, the architecture ensures a high success rate when performing design migration from lower density parts to higher density parts. In many cases, it is also possible to shift a lower utilization design targeted for a high-density device to a lower density device. However, the exact details of the final resource utilization will impact the likely success in each case.

			LVC MOS 1.2 = V <sub>CCIO</sub> /2	—
LVC MOS 2.5 I/O (Z -> H)	188	0pF	V <sub>CCIO</sub> /2	V <sub>OL</sub>
LVC MOS 2.5 I/O (Z -> L)			V <sub>CCIO</sub> /2	V <sub>OH</sub>
LVC MOS 2.5 I/O (H -> Z)			V <sub>OH</sub> - 0.15	V <sub>OL</sub>
LVC MOS 2.5 I/O (L -> Z)			V <sub>OL</sub> + 0.15	V <sub>OH</sub>

Note: Output test conditions for all other interfaces are determined by the respective standards.

**Signal Descriptions (Cont.)**

Signal Name	I/O	Descriptions
<b>Test and Programming</b> (Dedicated pins. Pull-up is enabled on input pins during configuration.)		
TMS	I	Test Mode Select input, used to control the 1149.1 state machine.
TCK	I	Test Clock input pin, used to clock the 1149.1 state machine.
TDI	I	Test Data in pin, used to load data into device using 1149.1 state machine. After power-up, this TAP port can be activated for configuration by sending appropriate command. (Note: once a configuration port is selected it is locked. Another configuration port cannot be selected until the power-up sequence).
TDO	O	Output pin -Test Data out pin used to shift data out of device using 1149.1.
V <sub>CCJ</sub>	—	V <sub>CCJ</sub> - The power supply pin for JTAG Test Access Port.
<b>Configuration Pads</b> (used during sysCONFIG)		
CFG[1:0]	I	Mode pins used to specify configuration modes values latched on rising edge of INITN. During configuration, a pull-up is enabled.
INITN	I/O	Open Drain pin - Indicates the FPGA is ready to be configured. During configuration, a pull-up is enabled. If CFG1 and CFG0 are high (SDM) then this pin is pulled low.
PROGRAMN	I	Initiates configuration sequence when asserted low. This pin always has an active pull-up.
DONE	I/O	Open Drain pin - Indicates that the configuration sequence is complete, and the startup sequence is in progress.
CCLK	I/O	Configuration Clock for configuring an FPGA in sysCONFIG mode.
BUSY	I/O	Generally not used. After configuration it is a user-programmable I/O pin.
CSN	I	sysCONFIG chip select (Active low). During configuration, a pull-up is enabled. After configuration it is user a programmable I/O pin.
CS1N	I	sysCONFIG chip select (Active Low). During configuration, a pull-up is enabled. After configuration it is user programmable I/O pin
WRITEN	I	Write Data on Parallel port (Active low). After configuration it is a user programmable I/O pin
D[7:0]	I/O	sysCONFIG Port Data I/O. After configuration these are user programmable I/O pins.
DOUT, CSON	O	Output for serial configuration data (rising edge of CCLK) when using sysCONFIG port. After configuration, it is a user-programmable I/O pin.
DI	I	Input for serial configuration data (clocked with CCLK) when using sysCONFIG port. During configuration, a pull-up is enabled. After configuration it is a user-programmable I/O pin.
SLEEPN <sup>2</sup>	I	Sleep Mode pin - Active low sleep pin. <sup>b</sup> When this pin is held high, the device operates normally. <sup>b</sup> When driven low, the device moves into Sleep Mode after a specified time. This pin has a weak internal pull-up, but when not used an external pull-up to V <sub>CC</sub> is recommended.
TOE <sup>3</sup>	I	Test Output Enable tri-states all I/O pins when driven low. This pin has a weak internal pull-up, but when not used an external pull-up to V <sub>CC</sub> is recommended.

1. Applies to LFXP10, LFXP15 and LFXP20 only.

2. Applies to LFXP "C" devices only.

3. Applies to LFXP "E" devices only.

# LatticeXP Family Data Sheet

## Supplemental Information

---

November 2007

Data Sheet DS1001

---

### For Further Information

A variety of technical notes for the LatticeXP family are available on the Lattice website at [www.latticesemi.com](http://www.latticesemi.com).

- LatticeECP/EC and LatticeXP sysIO Usage Guide (TN1056)
- Lattice ispTRACY Usage Guide (TN1054)
- LatticeECP/EC and LatticeXP sysCLOCK PLL Design and Usage Guide (TN1049)
- Memory Usage Guide for LatticeECP/EC and LatticeXP Devices (TN1051)
- LatticeECP/EC and XP DDR Usage Guide (TN1050)
- Power Estimation and Management for LatticeECP/EC and LatticeXP Devices (TN1052)
- LatticeXP sysCONFIG Usage Guide (TN1082)

For further information on interface standards refer to the following web sites:

- JEDEC Standards (LVTTI, LVCMOS, SSTL, HSTL): [www.jedec.org](http://www.jedec.org)
- PCI: [www.pcisig.com](http://www.pcisig.com)
