

Welcome to [E-XFL.COM](#)

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Details

Product Status	Obsolete
Number of LABs/CLBs	-
Number of Logic Elements/Cells	3000
Total RAM Bits	55296
Number of I/O	100
Number of Gates	-
Voltage - Supply	1.14V ~ 1.26V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	144-LQFP
Supplier Device Package	144-TQFP (20x20)
Purchase URL	https://www.e-xfl.com/product-detail/lattice-semiconductor/lfxp3e-3tn144i

Table 2-1. Slice Signal Descriptions

Function	Type	Signal Names	Description
Input	Data signal	A0, B0, C0, D0	Inputs to LUT4
Input	Data signal	A1, B1, C1, D1	Inputs to LUT4
Input	Multi-purpose	M0	Multipurpose Input
Input	Multi-purpose	M1	Multipurpose Input
Input	Control signal	CE	Clock Enable
Input	Control signal	LSR	Local Set/Reset
Input	Control signal	CLK	System Clock
Input	Inter-PFU signal	FCIN	Fast Carry In ¹
Output	Data signals	F0, F1	LUT4 output register bypass signals
Output	Data signals	Q0, Q1	Register Outputs
Output	Data signals	OFX0	Output of a LUT5 MUX
Output	Data signals	OFX1	Output of a LUT6, LUT7, LUT8 ² MUX depending on the slice
Output	Inter-PFU signal	FCO	For the right most PFU the fast carry chain output ¹

1. See Figure 2-2 for connection details.

2. Requires two PFUs.

Modes of Operation

Each Slice is capable of four modes of operation: Logic, Ripple, RAM and ROM. The Slice in the PFF is capable of all modes except RAM. Table 2-2 lists the modes and the capability of the Slice blocks.

Table 2-2. Slice Modes

	Logic	Ripple	RAM	ROM
PFU Slice	LUT 4x2 or LUT 5x1	2-bit Arithmetic Unit	SP 16x2	ROM 16x1 x 2
PFF Slice	LUT 4x2 or LUT 5x1	2-bit Arithmetic Unit	N/A	ROM 16x1 x 2

Logic Mode: In this mode, the LUTs in each Slice are configured as 4-input combinatorial lookup tables. A LUT4 can have 16 possible input combinations. Any logic function with four inputs can be generated by programming this lookup table. Since there are two LUT4s per Slice, a LUT5 can be constructed within one Slice. Larger lookup tables such as LUT6, LUT7 and LUT8 can be constructed by concatenating other Slices.

Ripple Mode: Ripple mode allows the efficient implementation of small arithmetic functions. In ripple mode, the following functions can be implemented by each Slice:

- Addition 2-bit
- Subtraction 2-bit
- Add/Subtract 2-bit using dynamic control
- Up counter 2-bit
- Down counter 2-bit
- Ripple mode multiplier building block
- Comparator functions of A and B inputs
 - A greater-than-or-equal-to B
 - A not-equal-to B
 - A less-than-or-equal-to B

Two additional signals: Carry Generate and Carry Propagate are generated per Slice in this mode, allowing fast arithmetic functions to be constructed by concatenating Slices.

RAM Mode: In this mode, distributed RAM can be constructed using each LUT block as a 16x1-bit memory. Through the combination of LUTs and Slices, a variety of different memories can be constructed.

Figure 2-5. Primary Clock Sources

Note: Smaller devices have two PLLs.

Secondary Clock Sources

LatticeXP devices have four secondary clock resources per quadrant. The secondary clock branches are tapped at every PFU. These secondary clock networks can also be used for controls and high fanout data. These secondary clocks are derived from four clock input pads and 16 routing signals as shown in Figure 2-6.

For more information on the PLL, please see details of additional technical documentation at the end of this data sheet.

Dynamic Clock Select (DCS)

The DCS is a global clock buffer with smart multiplexer functions. It takes two independent input clock sources and outputs a clock signal without any glitches or runt pulses. This is achieved irrespective of where the select signal is toggled. There are eight DCS blocks per device, located in pairs at the center of each side. Figure 2-12 illustrates the DCS Block Macro.

Figure 2-12. DCS Block Primitive

Figure 2-13 shows timing waveforms of the default DCS operating mode. The DCS block can be programmed to other modes. For more information on the DCS, please see details of additional technical documentation at the end of this data sheet.

Figure 2-13. DCS Waveforms

sysMEM Memory

The LatticeXP family of devices contain a number of sysMEM Embedded Block RAM (EBR). The EBR consists of a 9-Kbit RAM, with dedicated input and output registers.

sysMEM Memory Block

The sysMEM block can implement single port, dual port or pseudo dual port memories. Each block can be used in a variety of depths and widths as shown in Table 2-6.

Table 2-6. sysMEM Block Configurations

Memory Mode	Configurations
Single Port	8,192 x 1 4,096 x 2 2,048 x 4 1,024 x 9 512 x 18 256 x 36
True Dual Port	8,192 x 1 4,096 x 2 2,048 x 4 1,024 x 9 512 x 18
Pseudo Dual Port	8,192 x 1 4,096 x 2 2,048 x 4 1,024 x 9 512 x 18 256 x 36

Bus Size Matching

All of the multi-port memory modes support different widths on each of the ports. The RAM bits are mapped LSB word 0 to MSB word 0, LSB word 1 to MSB word 1 and so on. Although the word size and number of words for each port varies, this mapping scheme applies to each port.

RAM Initialization and ROM Operation

If desired, the contents of the RAM can be pre-loaded during device configuration. By preloading the RAM block during the chip configuration cycle and disabling the write controls, the sysMEM block can also be utilized as a ROM.

Memory Cascading

Larger and deeper blocks of RAMs can be created using EBR sysMEM Blocks. Typically, the Lattice design tools cascade memory transparently, based on specific design inputs.

Single, Dual and Pseudo-Dual Port Modes

Figure 2-14 shows the four basic memory configurations and their input/output names. In all the sysMEM RAM modes the input data and address for the ports are registered at the input of the memory array. The output data of the memory is optionally registered at the output.

Figure 2-18. Group of Seven PIOs**Figure 2-19. DQS Routing**

PIO

The PIO contains four blocks: an input register block, output register block, tristate register block and a control logic block. These blocks contain registers for both single data rate (SDR) and double data rate (DDR) operation along with the necessary clock and selection logic. Programmable delay lines used to shift incoming clock and data signals are also included in these blocks.

Input Register Block

The input register block contains delay elements and registers that can be used to condition signals before they are passed to the device core. Figure 2-20 shows the diagram of the input register block.

Input signals are fed from the sysIO buffer to the input register block (as signal DI). If desired the input signal can bypass the register and delay elements and be used directly as a combinatorial signal (INDD), a clock (INCK) and

Figure 2-23. Output Register Block**Figure 2-24. ODDRXB Primitive****Tristate Register Block**

The tristate register block provides the ability to register tri-state control signals from the core of the device before they are passed to the sysIO buffers. The block contains a register for SDR operation and an additional latch for DDR operation. Figure 2-25 shows the diagram of the Tristate Register Block.

In SDR mode, ONEG1 feeds one of the flip-flops that then feeds the output. The flip-flop can be configured a D-type or latch. In DDR mode, ONEG1 is fed into one register on the positive edge of the clock and OPOS1 is latched. A multiplexer running off the same clock selects the correct register for feeding to the output (D0).

Typical I/O Behavior During Power-up

The internal power-on-reset (POR) signal is deactivated when V_{CC} and V_{CCAUX} have reached satisfactory levels. After the POR signal is deactivated, the FPGA core logic becomes active. It is the user's responsibility to ensure that all other V_{CCIO} banks are active with valid input logic levels to properly control the output logic states of all the I/O banks that are critical to the application. The default configuration of the I/O pins in a blank device is tri-state with a weak pull-up to V_{CCIO} . The I/O pins will not take on the user configuration until V_{CC} , V_{CCAUX} and V_{CCIO} have reached satisfactory levels at which time the I/Os will take on the user-configured settings.

The V_{CC} and V_{CCAUX} supply the power to the FPGA core fabric, whereas the V_{CCIO} supplies power to the I/O buffers. In order to simplify system design while providing consistent and predictable I/O behavior, it is recommended that the I/O buffers be powered-up prior to the FPGA core fabric. V_{CCIO} supplies should be powered up before or together with the V_{CC} and V_{CCAUX} supplies.

Supported Standards

The LatticeXP sysIO buffer supports both single-ended and differential standards. Single-ended standards can be further subdivided into LVCMS, LVTTL and other standards. The buffers support the LVTTL, LVCMS 1.2, 1.5, 1.8, 2.5 and 3.3V standards. In the LVCMS and LVTTL modes, the buffer has individually configurable options for drive strength, bus maintenance (weak pull-up, weak pull-down, or a bus-keeper latch) and open drain. Other single-ended standards supported include SSTL and HSTL. Differential standards supported include LVDS, BLVDS, LVPECL, differential SSTL and differential HSTL. Tables 2-7 and 2-8 show the I/O standards (together with their supply and reference voltages) supported by the LatticeXP devices. For further information on utilizing the sysIO buffer to support a variety of standards please see the details of additional technical documentation at the end of this data sheet.

Table 2-7. Supported Input Standards

Input Standard	V_{REF} (Nom.)	V_{CCIO} ¹ (Nom.)
Single Ended Interfaces		
LVTTL	—	—
LVCMS33 ²	—	—
LVCMS25 ²	—	—
LVCMS18	—	1.8
LVCMS15	—	1.5
LVCMS12 ²	—	—
PCI	—	3.3
HSTL18 Class I, II	0.9	—
HSTL18 Class III	1.08	—

1. When not specified V_{CCIO} can be set anywhere in the valid operating range.2. JTAG inputs do not have a fixed threshold option and always follow V_{CCJ} .

DC Electrical Characteristics**Over Recommended Operating Conditions**

Symbol	Parameter	Condition	Min.	Typ.	Max.	Units
$I_{IL}, I_{IH}^{1, 2, 4}$	Input or I/O Leakage	$0 \leq V_{IN} \leq (V_{CCIO} - 0.2V)$	—	—	10	μA
		$(V_{CCIO} - 0.2V) < V_{IN} \leq 3.6V$	—	—	40	μA
I_{PU}	I/O Active Pull-up Current	$0 \leq V_{IN} \leq 0.7 V_{CCIO}$	-30	—	-150	μA
I_{PD}	I/O Active Pull-down Current	$V_{IL} (\text{MAX}) \leq V_{IN} \leq V_{IH} (\text{MAX})$	30	—	150	μA
I_{BHLS}	Bus Hold Low sustaining current	$V_{IN} = V_{IL} (\text{MAX})$	30	—	—	μA
I_{BHH}	Bus Hold High sustaining current	$V_{IN} = 0.7V_{CCIO}$	-30	—	—	μA
I_{BHLO}	Bus Hold Low Overdrive current	$0 \leq V_{IN} \leq V_{IH} (\text{MAX})$	—	—	150	μA
I_{BHHO}	Bus Hold High Overdrive current	$0 \leq V_{IN} \leq V_{IH} (\text{MAX})$	—	—	-150	μA
V_{BHT}	Bus Hold trip Points	$0 \leq V_{IN} \leq V_{IH} (\text{MAX})$	$V_{IL} (\text{MAX})$	—	$V_{IH} (\text{MIN})$	V
C1	I/O Capacitance ³	$V_{CCIO} = 3.3V, 2.5V, 1.8V, 1.5V, 1.2V, V_{CC} = 1.2V, V_{IO} = 0 \text{ to } V_{IH} (\text{MAX})$	—	8	—	pf
C2	Dedicated Input Capacitance ³	$V_{CCIO} = 3.3V, 2.5V, 1.8V, 1.5V, 1.2V, V_{CC} = 1.2V, V_{IO} = 0 \text{ to } V_{IH} (\text{MAX})$	—	8	—	pf

1. Input or I/O leakage current is measured with the pin configured as an input or as an I/O with the output driver tri-stated. It is not measured with the output driver active. Bus maintenance circuits are disabled.
2. Not applicable to SLEEPN/TOE pin.
3. $T_A = 25^\circ C$, $f = 1.0\text{MHz}$
4. When V_{IH} is higher than V_{CCIO} , a transient current typically of 30ns in duration or less with a peak current of 6mA can be expected on the high-to-low transition.

Supply Current (Sleep Mode)^{1, 2, 3}

Symbol	Parameter	Device	Typ. ⁴	Max	Units
I_{CC}	Core Power Supply	LFXP3C	12	65	μA
		LFXP6C	14	75	μA

1. Inputs on chip. Outputs are implemented with the addition of external resistors.

Signal Descriptions (Cont.)

Signal Name	I/O	Descriptions
Test and Programming (Dedicated pins. Pull-up is enabled on input pins during configuration.)		
TMS	I	Test Mode Select input, used to control the 1149.1 state machine.
TCK	I	Test Clock input pin, used to clock the 1149.1 state machine.
TDI	I	Test Data in pin, used to load data into device using 1149.1 state machine. After power-up, this TAP port can be activated for configuration by sending appropriate command. (Note: once a configuration port is selected it is locked. Another configuration port cannot be selected until the power-up sequence).
TDO	O	Output pin -Test Data out pin used to shift data out of device using 1149.1.
V _{CCJ}	—	V _{CCJ} - The power supply pin for JTAG Test Access Port.
Configuration Pads (used during sysCONFIG)		
CFG[1:0]	I	Mode pins used to specify configuration modes values latched on rising edge of INITN. During configuration, a pull-up is enabled.
INITN	I/O	Open Drain pin - Indicates the FPGA is ready to be configured. During configuration, a pull-up is enabled. If CFG1 and CFG0 are high (SDM) then this pin is pulled low.
PROGRAMN	I	Initiates configuration sequence when asserted low. This pin always has an active pull-up.
DONE	I/O	Open Drain pin - Indicates that the configuration sequence is complete, and the startup sequence is in progress.
CCLK	I/O	Configuration Clock for configuring an FPGA in sysCONFIG mode.
BUSY	I/O	Generally not used. After configuration it is a user-programmable I/O pin.
CSN	I	sysCONFIG chip select (Active low). During configuration, a pull-up is enabled. After configuration it is user a programmable I/O pin.
CS1N	I	sysCONFIG chip select (Active Low). During configuration, a pull-up is enabled. After configuration it is user programmable I/O pin
WRITEN	I	Write Data on Parallel port (Active low). After configuration it is a user programmable I/O pin
D[7:0]	I/O	sysCONFIG Port Data I/O. After configuration these are user programmable I/O pins.
DOUT, CSON	O	Output for serial configuration data (rising edge of CCLK) when using sysCONFIG port. After configuration, it is a user-programmable I/O pin.
DI	I	Input for serial configuration data (clocked with CCLK) when using sysCONFIG port. During configuration, a pull-up is enabled. After configuration it is a user-programmable I/O pin.
SLEEPN ²	I	Sleep Mode pin - Active low sleep pin. ^b When this pin is held high, the device operates normally. ^b When driven low, the device moves into Sleep Mode after a specified time. This pin has a weak internal pull-up, but when not used an external pull-up to V _{CC} is recommended.
TOE ³	I	Test Output Enable tri-states all I/O pins when driven low. This pin has a weak internal pull-up, but when not used an external pull-up to V _{CC} is recommended.

1. Applies to LFXP10, LFXP15 and LFXP20 only.

2. Applies to LFXP "C" devices only.

3. Applies to LFXP "E" devices only.

1. Applies to LFXP "C" only.

2. Applies to LFXP "E" only.

3. Supports dedicated LVDS outputs.
