### Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

## Introduction

The LatticeXP family of FPGA devices combine logic gates, embedded memory and high performance I/Os in a single architecture that is both non-volatile and infinitely reconfigurable to support cost-effective system designs.

The re-programmable non-volatile technology used in the LatticeXP family is the next generation ispXP™ technology. With this technology, expensive external configuration memories are not required and designs are secured from unauthorized read-back. In addition, instant-on capability allows for easy interfacing in many applications.

The ispLEVER® design tool from Lattice allows large complex designs to be efficiently implemented using the LatticeXP family of FPGA devices. Synthesis library support for LatticeXP is available for popular logic synthesis tools. The ispLEVER tool uses the synthesis tool output along with the constraints from its floor planning tools to place and route the design in the LatticeXP device. The ispLEVER tool extracts the timing from the routing and back-annotates it into the design for timing verification.

Lattice provides many pre-designed IP (Intellectual Property) ispLeverCORE™ modules for the LatticeXP family. By using these IPs as standardized blocks, designers are free to concentrate on the unique aspects of their design, increasing their productivity.

For more information on the PLL, please see details of additional technical documentation at the end of this data sheet.

## Dynamic Clock Select (DCS)

The DCS is a global clock buffer with smart multiplexer functions. It takes two independent input clock sources and outputs a clock signal without any glitches or runt pulses. This is achieved irrespective of where the select signal is toggled. There are eight DCS blocks per device, located in pairs at the center of each side. Figure 2-12 illustrates the DCS Block Macro.

**Figure 2-12. DCS Block Primitive**

Figure 2-13 shows timing waveforms of the default DCS operating mode. The DCS block can be programmed to other modes. For more information on the DCS, please see details of additional technical documentation at the end of this data sheet.

**Figure 2-13. DCS Waveforms**

## sysMEM Memory

The LatticeXP family of devices contain a number of sysMEM Embedded Block RAM (EBR). The EBR consists of a 9-Kbit RAM, with dedicated input and output registers.

### sysMEM Memory Block

The sysMEM block can implement single port, dual port or pseudo dual port memories. Each block can be used in a variety of depths and widths as shown in Table 2-6.

**Figure 2-14. sysMEM Memory Primitives**

The EBR memory supports three forms of write behavior for single port or dual port operation:

1. **Normal** – data on the output appears only during read cycle. During a write cycle, the data (at the current address) does not appear on the output. This mode is supported for all data widths.
2. **Write Through** – a copy of the input data appears at the output of the same port during a write cycle. This mode is supported for all data widths.
3. **Read-Before-Write** – when new data is being written, the old content of the address appears at the output. This mode is supported for x9, x18 and x36 data widths.

### Memory Core Reset

The memory array in the EBR utilizes latches at the A and B output ports. These latches can be reset asynchronously. RSTA and RSTB are local signals, which reset the output latches associated with Port A and Port B respectively. The Global Reset (GSRN) signal resets both ports. The output data latches and associated resets for both ports are as shown in Figure 2-15.

**Figure 2-18. Group of Seven PIOs****Figure 2-19. DQS Routing**

## PIO

The PIO contains four blocks: an input register block, output register block, tristate register block and a control logic block. These blocks contain registers for both single data rate (SDR) and double data rate (DDR) operation along with the necessary clock and selection logic. Programmable delay lines used to shift incoming clock and data signals are also included in these blocks.

### Input Register Block

The input register block contains delay elements and registers that can be used to condition signals before they are passed to the device core. Figure 2-20 shows the diagram of the input register block.

Input signals are fed from the sysIO buffer to the input register block (as signal DI). If desired the input signal can bypass the register and delay elements and be used directly as a combinatorial signal (INDD), a clock (INCK) and

Figure 2-28. LatticeXP Banks

Note: N and M are the maximum number of I/Os per bank.

LatticeXP devices contain two types of sysIO buffer pairs.

1. **Top and Bottom sysIO Buffer Pair (Single-Ended Outputs Only)**

The sysIO buffer pairs in the top and bottom banks of the device consist of two single-ended output drivers and two sets of single-ended input buffers (both ratioed and referenced). The referenced input buffer can also be configured as a differential input.

The two pads in the pair are described as “true” and “comp”, where the true pad is associated with the positive side of the differential input buffer and the comp (complementary) pad is associated with the negative side of the differential input buffer.

Only the I/Os on the top and bottom banks have PCI clamps. Note that the PCI clamp is enabled after  $V_{CC}$ ,  $V_{CCAUX}$  and  $V_{CCIO}$  are at valid operating levels and the device has been configured.

2. **Left and Right sysIO Buffer Pair (Differential and Single-Ended Outputs)**

The sysIO buffer pairs in the left and right banks of the device consist of two single-ended output drivers, two sets of single-ended input buffers (both ratioed and referenced) and one differential output driver. The referenced input buffer can also be configured as a differential input. In these banks the two pads in the pair are described as “true” and “comp”, where the true pad is associated with the positive side of the differential I/O, and the comp (complementary) pad is associated with the negative side of the differential I/O.

Select I/Os in the left and right banks have LVDS differential output drivers. Refer to the Logic Signal Connections tables for more information.

### Absolute Maximum Ratings<sup>1, 2, 3, 4</sup>

|                                                        | XPE (1.2V)              | XPC (1.8V/2.5V/3.3V) |

| Storage Temperature (Ambient) . . . . .                | -65 to 150°C . . . . .  | -65 to 150°C         |
| Junction Temp. (Tj) . . . . .                          | +125°C . . . . .        | +125°C               |

1. Stress above those listed under the "Absolute Maximum Ratings" may cause permanent damage to the device. Functional operation of the device at these or any other conditions outside of those indicated in the operational sections of this specification is not implied.
2. Compliance with the Lattice *Thermal Management* document is required.
3. All voltages referenced to GND.
4. All chip grounds are connected together to a common package GND plane.
5. Overshoot and undershoot of -2V to ( $V_{IHMAX} + 2$ ) volts is permitted for a duration of <20ns.

### Recommended Operating Conditions<sup>3</sup>

| Symbol                     | Parameter                                           | Min.  | Max.  | Units |
|----------------------------|-----------------------------------------------------|-------|-------|-------|
| $V_{CC}$                   | Core Supply Voltage for 1.2V Devices                | 1.14  | 1.26  | V     |
|                            | Core Supply Voltage for 1.8V/2.5V/3.3V Devices      | 1.71  | 3.465 | V     |
| $V_{CCP}$                  | Supply Voltage for PLL for 1.2V Devices             | 1.14  | 1.26  | V     |
|                            | Supply Voltage for PLL for 1.8V/2.5V/3.3V Devices   | 1.71  | 3.465 | V     |
| $V_{CCAUX}$ <sup>4</sup>   | Auxiliary Supply Voltage                            | 3.135 | 3.465 | V     |
| $V_{CCIO}$ <sup>1, 2</sup> | I/O Driver Supply Voltage                           | 1.14  | 3.465 | V     |
| $V_{CCJ}$ <sup>1</sup>     | Supply Voltage for IEEE 1149.1 Test Access Port     | 1.14  | 3.465 | V     |
| $t_{JCOM}$                 | Junction Temperature, Commercial Operation          | 0     | 85    | C     |
| $t_{JIND}$                 | Junction Temperature, Industrial Operation          | -40   | 100   | C     |
| $t_{JFLASHCOM}$            | Junction Temperature, Flash Programming, Commercial | 0     | 85    | C     |
| $t_{JFLASHIND}$            | Junction Temperature, Flash Programming, Industrial | 0     | 85    | C     |

1. If  $V_{CCIO}$  or  $V_{CCJ}$  is set to 3.3V, they must be connected to the same power supply as  $V_{CCAUX}$ . For the XPE devices (1.2V  $V_{CC}$ ), if  $V_{CCIO}$  or  $V_{CCJ}$  is set to 1.2V, they must be connected to the same power supply as  $V_{CC}$ .
2. See recommended voltages by I/O standard in subsequent table.
3. The system designer must ensure that the FPGA design stays within the specified junction temperature and package thermal capabilities of the device based on the expected operating frequency, activity factor and environment conditions of the system.
4.  $V_{CCAUX}$  ramp rate must not exceed 30mV/ $\mu$ s during power up when transitioning between 0V and 3.3V.

**Figure 3-4. RSDS (Reduced Swing Differential Standard)****Table 3-4. RSDS DC Conditions**

| Parameter  | Description                 | Typical | Units |
