### **Understanding Embedded - FPGAs (Field Programmable Gate Array)**

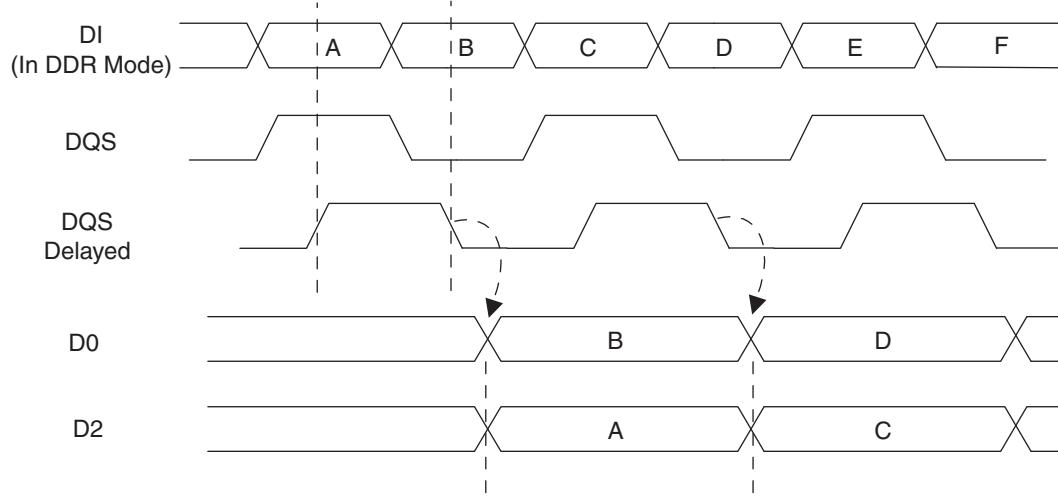

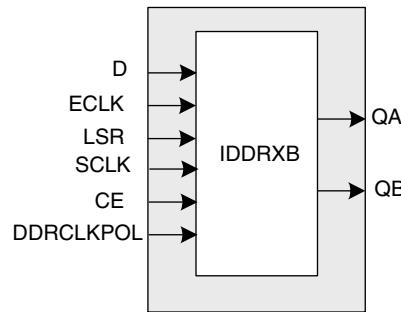

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### **Applications of Embedded - FPGAs**

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

#### **Details**

Product Status	Obsolete
Number of LABs/CLBs	-
Number of Logic Elements/Cells	6000
Total RAM Bits	73728
Number of I/O	142
Number of Gates	-
Voltage - Supply	1.71V ~ 3.465V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	208-BFQFP
Supplier Device Package	208-PQFP (28x28)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/lattice-semiconductor/lfxp6c-5q208c">https://www.e-xfl.com/product-detail/lattice-semiconductor/lfxp6c-5q208c</a>

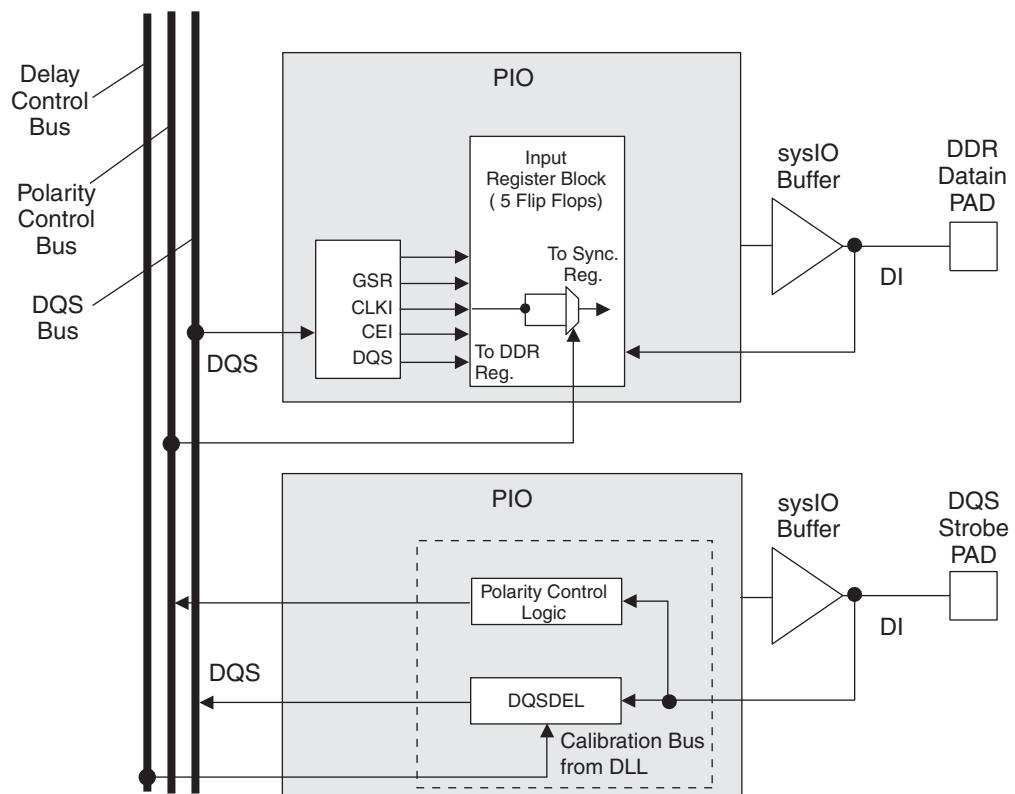

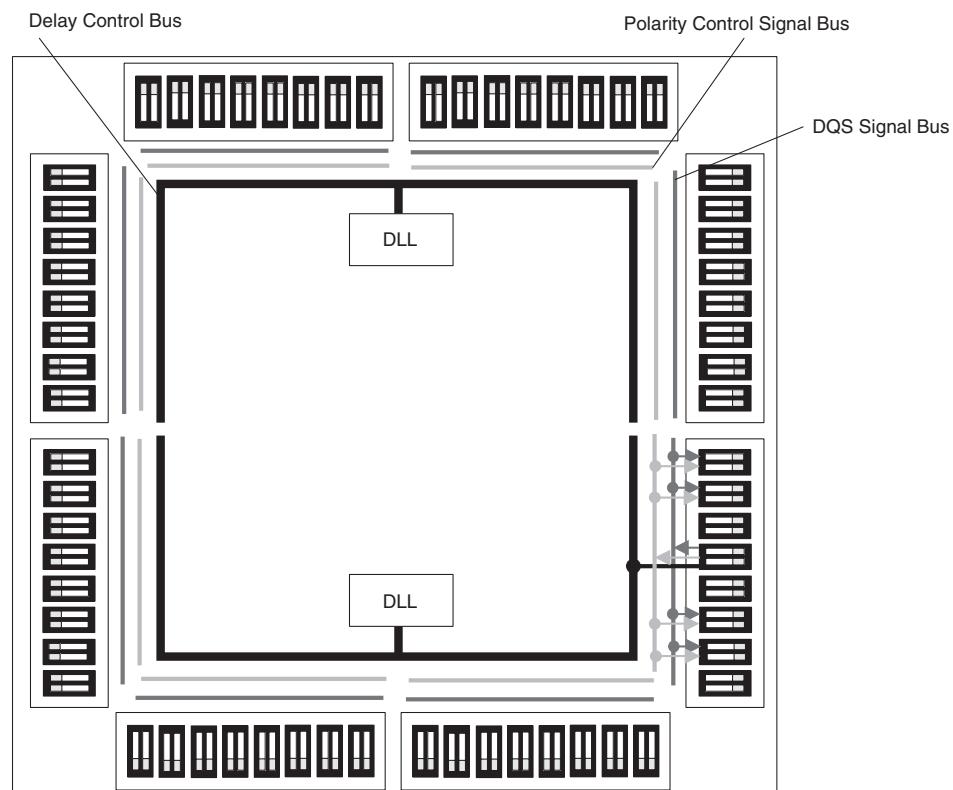

**Figure 2-21. Input Register DDR Waveforms****Figure 2-22. INDDRXB Primitive**

### Output Register Block

The output register block provides the ability to register signals from the core of the device before they are passed to the sysIO buffers. The block contains a register for SDR operation that is combined with an additional latch for DDR operation. Figure 2-23 shows the diagram of the Output Register Block.

In SDR mode, ONEG0 feeds one of the flip-flops that then feeds the output. The flip-flop can be configured as a D-type or as a latch. In DDR mode, ONEG0 is fed into one register on the positive edge of the clock and OPOS0 is latched. A multiplexer running off the same clock selects the correct register for feeding to the output (D0).

Figure 2-24 shows the design tool DDR primitives. The SDR output register has reset and clock enable available. The additional register for DDR operation does not have reset or clock enable available.

1. The average DC current drawn by I/Os between GND connections, or between the last GND in an I/O bank and the end of an I/O bank, as shown in the logic signal connections table shall not exceed n \* 8mA. Where n is the number of I/Os between bank GND connections or between the last GND in a bank and the end of a bank.

**LVPECL**

The LatticeXP devices support differential LVPECL standard. This standard is emulated using complementary LVC MOS outputs in conjunction with a parallel resistor across the driver outputs. The LVPECL input standard is supported by the LVDS differential input buffer. The scheme shown in Figure 3-3 is one possible solution for point-to-point signals.

**Figure 3-3. Differential LVPECL****Table 3-3. LVPECL DC Conditions<sup>1</sup>****Over Recommended Operating Conditions**

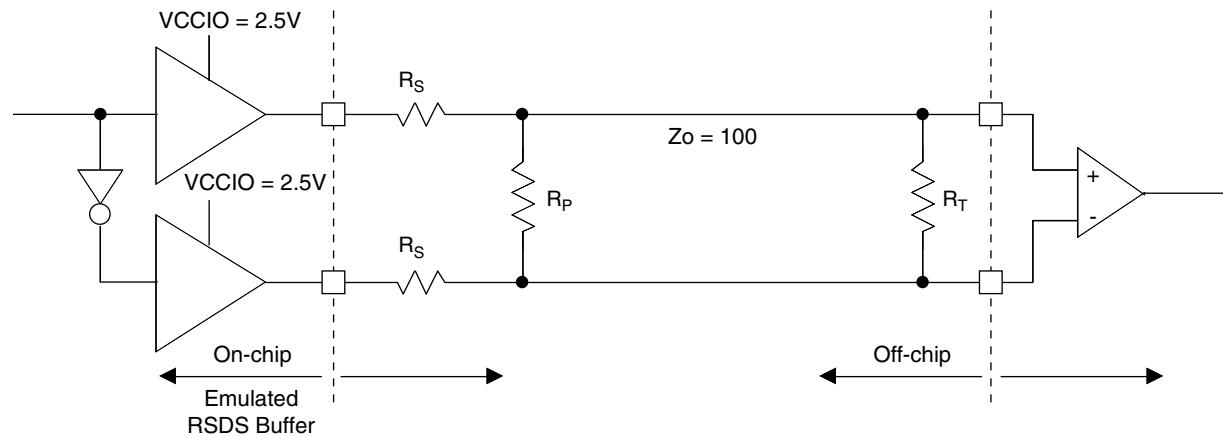

Symbol	Description	Typical	Units
$Z_{OUT}$	Output impedance	100	ohms
$R_P$	Driver parallel resistor	187	ohms
$R_S$	Driver series resistor	100	ohms
$R_T$	Receiver termination	100	ohms
$V_{OH}$	Output high voltage	2.03	V
$V_{OL}$	Output low voltage	1.27	V
$V_{OD}$	Output differential voltage	0.76	V
$V_{CM}$	Output common mode voltage	1.65	V
$Z_{BACK}$	Back impedance	85.7	ohms
$I_{DC}$	DC output current	12.7	mA

1. For input buffer, see LVDS table.

For further information on LVPECL, BLVDS and other differential interfaces please see details of additional technical documentation at the end of the data sheet.

**RSDS**

The LatticeXP devices support differential RSDS standard. This standard is emulated using complementary LVC MOS outputs in conjunction with a parallel resistor across the driver outputs. The RSDS input standard is supported by the LVDS differential input buffer. The scheme shown in Figure 3-4 is one possible solution for RSDS standard implementation. Use LVDS25E mode with suggested resistors for RSDS operation. Resistor values in Figure 3-4 are industry standard values for 1% resistors.

**Figure 3-4. RSDS (Reduced Swing Differential Standard)****Table 3-4. RSDS DC Conditions**

Parameter	Description	Typical	Units
$Z_{OUT}$	Output impedance	20	ohms
$R_S$	Driver series resistor	300	ohms
$R_P$	Driver parallel resistor	121	ohms
$R_T$	Receiver termination	100	ohms
$V_{OH}$	Output high voltage	1.35	V
$V_{OL}$	Output low voltage	1.15	V
$V_{OD}$	Output differential voltage	0.20	V
$V_{CM}$	Output common mode voltage	1.25	V
$Z_{BACK}$	Back impedance	101.5	ohms
$I_{DC}$	DC output current	3.66	mA

## Derating Logic Timing

Logic timing provided in the following sections of this data sheet and in the ispLEVER design tools are worst case numbers in the operating range. Actual delays at nominal temperature and voltage for best-case process can be much better than the values given in the tables. The ispLEVER design tool from Lattice can provide logic timing numbers at a particular temperature and voltage.

- During configuration the user-programmable I/Os are tri-stated with an internal pull-up resistor enabled. If any pin is not used (or not bonded to a package pin), it is also tri-stated with an internal pull-up resistor enabled after configuration.
- The differential I/O per bank includes both dedicated LVDS and emulated LVDS pin pairs. Please see the Logic Signal Connections table for more information.
