#### Understanding **Embedded - FPGAs (Field Programmable Gate Array)**

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

#### **Applications of Embedded - FPGAs**

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

##### **Details**

Product Status	Obsolete
Number of LABs/CLBs	-
Number of Logic Elements/Cells	6000
Total RAM Bits	73728
Number of I/O	188
Number of Gates	-
Voltage - Supply	1.14V ~ 1.26V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	256-BGA

### Features

- **Non-volatile, Infinitely Reconfigurable**
  - Instant-on – powers up in microseconds
  - No external configuration memory
  - Excellent design security, no bit stream to intercept
  - Reconfigure SRAM based logic in milliseconds
  - SRAM and non-volatile memory programmable through system configuration and JTAG ports
- **Sleep Mode**
  - Allows up to 1000x static current reduction
- **TransFR™ Reconfiguration (TFR)**
  - In-field logic update while system operates
- **Extensive Density and Package Options**
  - 3.1K to 19.7K LUT4s
  - 62 to 340 I/Os
  - Density migration supported
- **Embedded and Distributed Memory**
  - 54 Kbits to 396 Kbits sysMEM™ Embedded Block RAM
  - Up to 79 Kbits distributed RAM
  - Flexible memory resources:
    - Distributed and block memory

### ■ Flexible I/O Buffer

- Programmable sysIO™ buffer supports wide range of interfaces:
  - LVCMS 3.3/2.5/1.8/1.5/1.2
  - LVTTL
  - SSTL 18 Class I
  - SSTL 3/2 Class I, II
  - HSTL15 Class I, III
  - HSTL 18 Class I, II, III
  - PCI
  - LVDS, Bus-LVDS, LVPECL, RSDS

### ■ Dedicated DDR Memory Support

- Implements interface up to DDR333 (166MHz)

### ■ sysCLOCK™ PLLs

- Up to 4 analog PLLs per device
- Clock multiply, divide and phase shifting

### ■ System Level Support

- IEEE Standard 1149.1 Boundary Scan, plus ispTRACY™ internal logic analyzer capability
- Onboard oscillator for configuration
- Devices operate with 3.3V, 2.5V, 1.8V or 1.2V power supply

## Polarity Control Logic

In a typical DDR Memory interface design, the phase relation between the incoming delayed DQS strobe and the internal system Clock (during the READ cycle) is unknown.

The LatticeXP family contains dedicated circuits to transfer data between these domains. To prevent setup and hold violations at the domain transfer between DQS (delayed) and the system Clock a clock polarity selector is used. This changes the edge on which the data is registered in the synchronizing registers in the input register block. This requires evaluation at the start of the each READ cycle for the correct clock polarity.

Prior to the READ operation in DDR memories DQS is in tristate (pulled by termination). The DDR memory device drives DQS low at the start of the preamble state. A dedicated circuit detects this transition. This signal is used to control the polarity of the clock to the synchronizing registers.

## sysIO Buffer

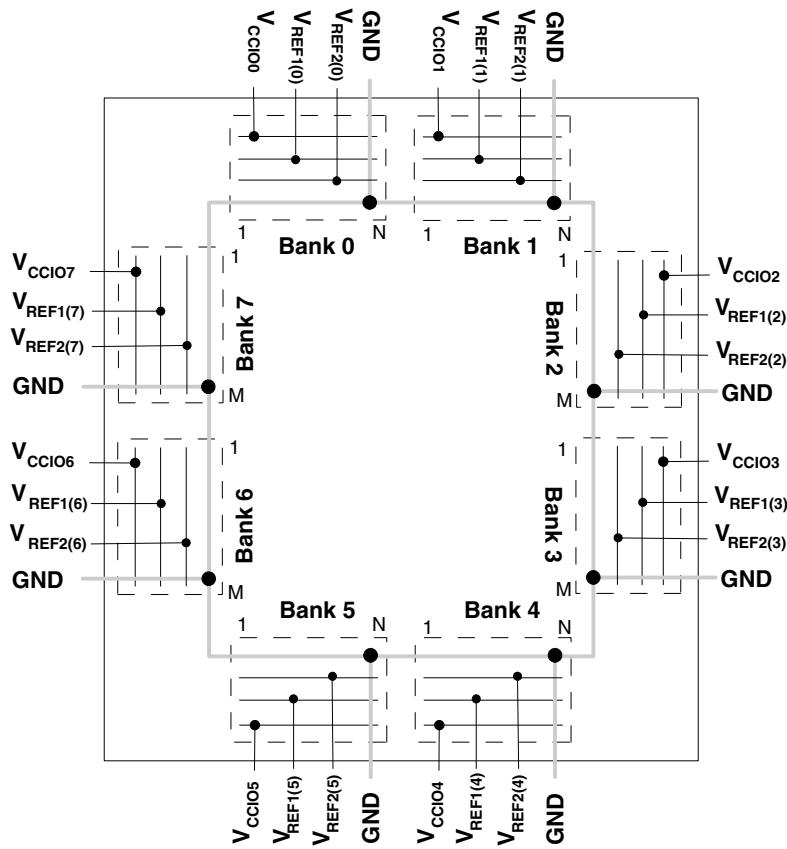

Each I/O is associated with a flexible buffer referred to as a sysIO buffer. These buffers are arranged around the periphery of the device in eight groups referred to as Banks. The sysIO buffers allow users to implement the wide variety of standards that are found in today's systems including LVCMOS, SSTL, HSTL, LVDS and LVPECL.

### sysIO Buffer Banks

LatticeXP devices have eight sysIO buffer banks; each is capable of supporting multiple I/O standards. Each sysIO bank has its own I/O supply voltage ( $V_{CCIO}$ ), and two voltage references  $V_{REF1}$  and  $V_{REF2}$  resources allowing each bank to be completely independent from each other. Figure 2-28 shows the eight banks and their associated supplies.

In the LatticeXP devices, single-ended output buffers and ratioed input buffers (LVTTL, LVCMOS, PCI and PCI-X) are powered using  $V_{CCIO}$ . LVTTL, LVCMOS33, LVCMOS25 and LVCMOS12 can also be set as a fixed threshold input independent of  $V_{CCIO}$ . In addition to the bank  $V_{CCIO}$  supplies, the LatticeXP devices have a  $V_{CC}$  core logic power supply, and a  $V_{CCAUX}$  supply that power all differential and referenced buffers.

Each bank can support up to two separate VREF voltages, VREF1 and VREF2 that set the threshold for the referenced input buffers. In the LatticeXP devices, a dedicated pin in a bank can be configured to be a reference voltage supply pin. Each I/O is individually configurable based on the bank's supply and reference voltages.

**Figure 2-28. LatticeXP Banks**

Note: N and M are the maximum number of I/Os per bank.

LatticeXP devices contain two types of sysIO buffer pairs.

#### 1. Top and Bottom sysIO Buffer Pair (Single-Ended Outputs Only)

The sysIO buffer pairs in the top and bottom banks of the device consist of two single-ended output drivers and two sets of single-ended input buffers (both ratioed and referenced). The referenced input buffer can also be configured as a differential input.

The two pads in the pair are described as “true” and “comp”, where the true pad is associated with the positive side of the differential input buffer and the comp (complementary) pad is associated with the negative side of the differential input buffer.

Only the I/Os on the top and bottom banks have PCI clamps. Note that the PCI clamp is enabled after  $V_{CC}$ ,  $V_{CCAUX}$  and  $V_{CCIO}$  are at valid operating levels and the device has been configured.

#### 2. Left and Right sysIO Buffer Pair (Differential and Single-Ended Outputs)

The sysIO buffer pairs in the left and right banks of the device consist of two single-ended output drivers, two sets of single-ended input buffers (both ratioed and referenced) and one differential output driver. The referenced input buffer can also be configured as a differential input. In these banks the two pads in the pair are described as “true” and “comp”, where the true pad is associated with the positive side of the differential I/O, and the comp (complementary) pad is associated with the negative side of the differential I/O.

Select I/Os in the left and right banks have LVDS differential output drivers. Refer to the Logic Signal Connections tables for more information.

1. If V<sub>CCIO</sub> or V<sub>CCJ</sub> is set to 3.3V, they must be connected to the same power supply as V<sub>CCAUX</sub>. For the XPE devices (1.2V V<sub>CC</sub>), if V<sub>CCIO</sub> or V<sub>CCJ</sub> is set to 1.2V, they must be connected to the same power supply as V<sub>CC</sub>.

2. See recommended voltages by I/O standard in subsequent table.

3. The system designer must ensure that the FPGA design stays within the specified junction temperature and package thermal capabilities of the device based on the expected operating frequency, activity factor and environment conditions of the system.

4. V<sub>CCAUX</sub> ramp rate must not exceed 30mV/μs during power up when transitioning between 0V and 3.3V.
