Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

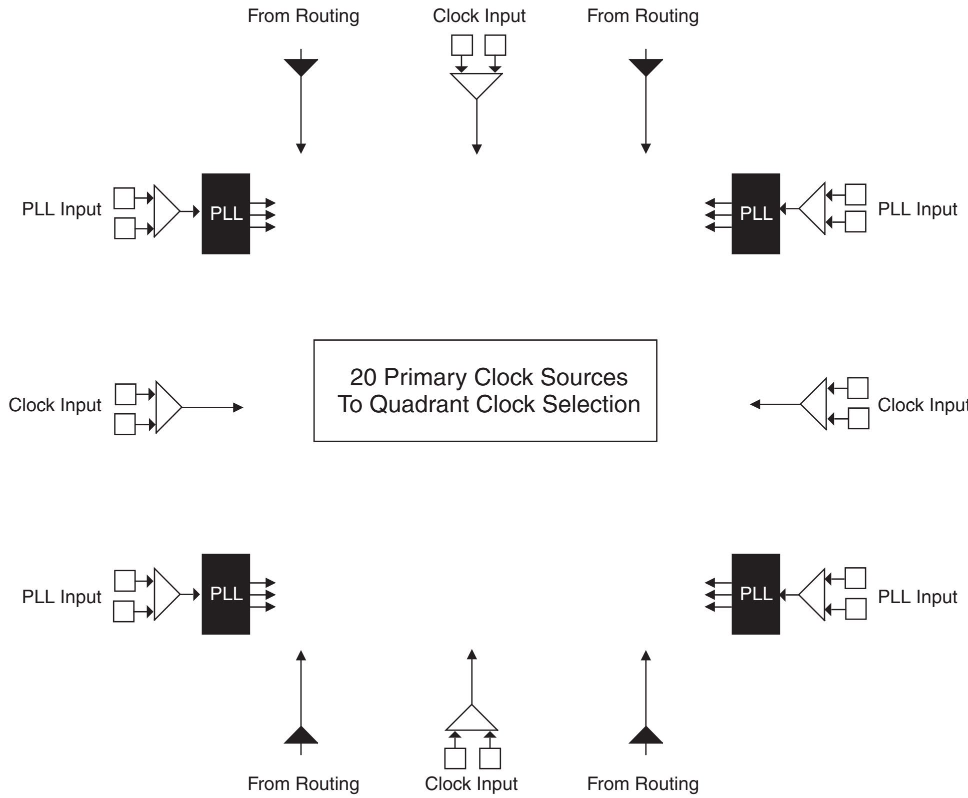
Figure 2-5. Primary Clock Sources

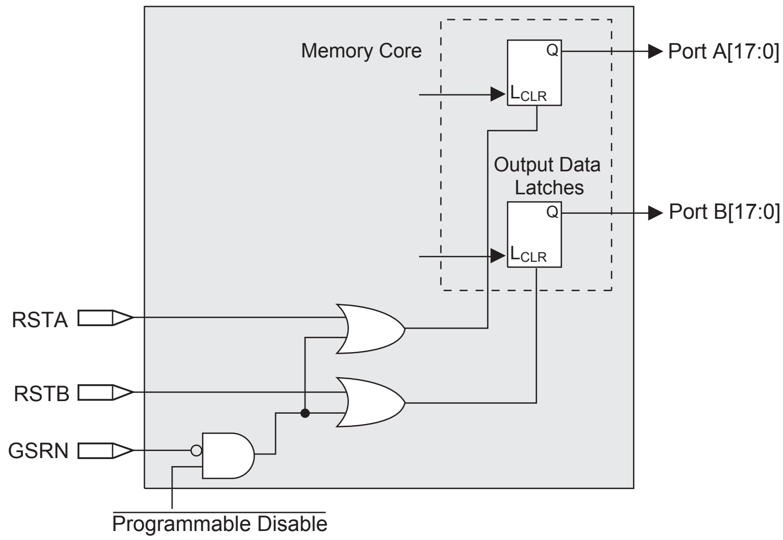


Note: Smaller devices have two PLLs.

Secondary Clock Sources

LatticeXP devices have four secondary clock resources per quadrant. The secondary clock branches are tapped at every PFU. These secondary clock networks can also be used for controls and high fanout data. These secondary clocks are derived from four clock input pads and 16 routing signals as shown in Figure 2-6.

Figure 2-15. Memory Core Reset

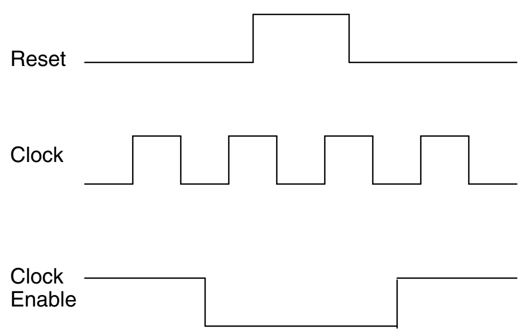


For further information on sysMEM EBR block, see the details of additional technical documentation at the end of this data sheet.

EBR Asynchronous Reset

EBR asynchronous reset or GSR (if used) can only be applied if all clock enables are low for a clock cycle before the reset is applied and released a clock cycle after the reset is released, as shown in Figure 2-16. The GSR input to the EBR is always asynchronous.

Figure 2-16. EBR Asynchronous Reset (Including GSR) Timing Diagram



If all clock enables remain enabled, the EBR asynchronous reset or GSR may only be applied and released after the EBR read and write clock inputs are in a steady state condition for a minimum of $1/f_{MAX}$ (EBR clock). The reset release must adhere to the EBR synchronous reset setup time before the next active read or write clock edge.

If an EBR is pre-loaded during configuration, the GSR input must be disabled or the release of the GSR during device Wake Up must occur before the release of the device I/Os becoming active.

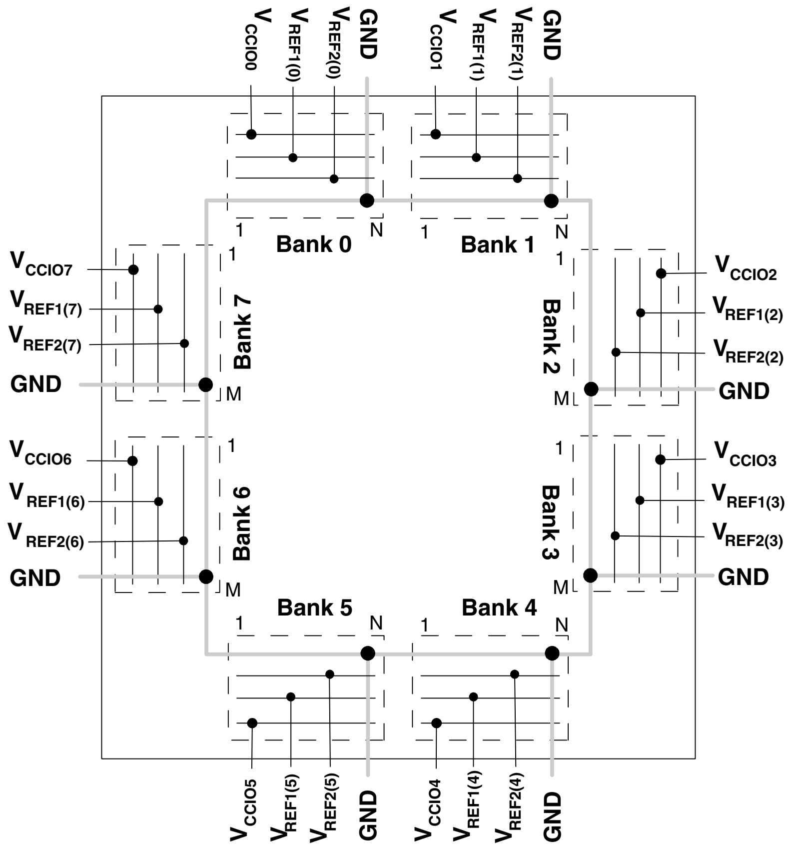
These instructions apply to all EBR RAM and ROM implementations.

Note that there are no reset restrictions if the EBR synchronous reset is used and the EBR GSR input is disabled.

Programmable I/O Cells (PICs)

Each PIC contains two PIOs connected to their respective sysIO Buffers which are then connected to the PADs as shown in Figure 2-17. The PIO Block supplies the output data (DO) and the Tri-state control signal (TO) to sysIO buffer, and receives input from the buffer.

Figure 2-28. LatticeXP Banks



Note: N and M are the maximum number of I/Os per bank.

LatticeXP devices contain two types of sysIO buffer pairs.

1. **Top and Bottom sysIO Buffer Pair (Single-Ended Outputs Only)**
   The sysIO buffer pairs in the top and bottom banks of the device consist of two single-ended output drivers and two sets of single-ended input buffers (both ratioed and referenced). The referenced input buffer can also be configured as a differential input.

   The two pads in the pair are described as “true” and “comp”, where the true pad is associated with the positive side of the differential input buffer and the comp (complementary) pad is associated with the negative side of the differential input buffer.

   Only the I/Os on the top and bottom banks have PCI clamps. Note that the PCI clamp is enabled after $V_{CC,}$ V_{CCAUX} and V_{CCIO} are at valid operating levels and the device has been configured.

2. **Left and Right sysIO Buffer Pair (Differential and Single-Ended Outputs)**
   The sysIO buffer pairs in the left and right banks of the device consist of two single-ended output drivers, two sets of single-ended input buffers (both ratioed and referenced) and one differential output driver. The referenced input buffer can also be configured as a differential input. In these banks the two pads in the pair are described as “true” and “comp”, where the true pad is associated with the positive side of the differential I/O, and the comp (complementary) pad is associated with the negative side of the differential I/O.

   Select I/Os in the left and right banks have LVDS differential output drivers. Refer to the Logic Signal Connections tables for more information.

1. Input or I/O leakage current is measured with the pin configured as an input or as an I/O with the output driver tri-stated. It is not measured with the output driver active. Bus maintenance circuits are disabled.
2. Not applicable to SLEEPN/TOE pin.
3. T_A 25°C, f = 1.0MHz
4. When V_{IH} is higher than V_{CCIO}, a transient current typically of 30ns in duration or less with a peak current of 6mA can be expected on the high-to-low transition.

LVPECL

The LatticeXP devices support differential LVPECL standard. This standard is emulated using complementary LVCMOS outputs in conjunction with a parallel resistor across the driver outputs. The LVPECL input standard is supported by the LVDS differential input buffer. The scheme shown in Figure 3-3 is one possible solution for point-to-point signals.

For further information on LVPECL, BLVDS and other differential interfaces please see details of additional technical documentation at the end of the data sheet.

RSDS

The LatticeXP devices support differential RSDS standard. This standard is emulated using complementary LVCMOS outputs in conjunction with a parallel resistor across the driver outputs. The RSDS input standard is supported by the LVDS differential input buffer. The scheme shown in Figure 3-4 is one possible solution for RSDS standard implementation. Use LVDS25E mode with suggested resistors for RSDS operation. Resistor values in Figure 3-4 are industry standard values for 1% resistors.

1. During configuration the user-programmable I/Os are tri-stated with an internal pull-up resistor enabled. If any pin is not used (or not bonded to a package pin), it is also tri-stated with an internal pull-up resistor enabled after configuration.
2. The differential I/O per bank includes both dedicated LVDS and emulated LVDS pin pairs. Please see the Logic Signal Connections table for more information.

Revision History

Revision History

Date	Version	Section	Change Summary
February 2005	01.0	—	Initial release.
April 2005	01.1	Architecture	EBR memory support section updated with clarification.
May 2005	01.2	Introduction	Added TransFR Reconfiguration to Features section.
		Architecture	Added TransFR section.
June 2005	01.3	Pinout Information	Added pinout information for LFXP3, LFXP6, LFXP15 and LFXP20.
July 2005	02.0	Introduction	Updated XP6, XP15 and XP20 EBR SRAM Bits and Block numbers.
		Architecture	Updated Per Quadrant Primary Clock Selection figure.
			Added Typical I/O Behavior During Power-up section.
			Updated Device Configuration section under Configuration and Testing.
		DC and Switching Characteristics	Clarified Hot Socketing Specification
			Updated Supply Current (Standby) Table
			Updated Initialization Supply Current Table
			Added Programming and Erase Flash Supply Current table
			Added LVDS Emulation section. Updated LVDS25E Output Termination Example figure and LVDS25E DC Conditions table.
			Updated Differential LVPECL diagram and LVPECL DC Conditions table.
			Deleted 5V Tolerant Input Buffer section. Updated RSDS figure and RSDS DC Conditions table.
			Updated sysCONFIG Port Timing Specifications
			Updated JTAG Port Timing Specifications. Added Flash Download Time table.
		Pinout Information	Updated Signal Descriptions table.
			Updated Logic Signal Connections Dual Function column.
		Ordering Information	Added lead-free ordering part numbers.
July 2005	02.1	DC and Switching Characteristics	Clarification of Flash Programming Junction Temperature
August 2005	02.2	Introduction	Added Sleep Mode feature.
		Architecture	Added Sleep Mode section.
		DC and Switching Characteristics	Added Sleep Mode Supply Current Table
			Added Sleep Mode Timing section
		Pinout Information	Added SLEEPN and TOE signal names, descriptions and footnotes.
			Added SLEEPN and TOE to pinout information and footnotes.
			Added footnote 3 to Logic Signal Connections tables for clarification on emulated LVDS output.
September 2005	03.0	Architecture	Added clarification of PCI clamp.
			Added clarification to SLEEPN Pin Characteristics section.
		DC and Switching Characteristics	DC Characteristics, added footnote 4 for clarification. Updated Supply Current (Sleep Mode), Supply Current (Standby), Initialization Supply Current, and Programming and Erase Flash Supply Current typical numbers.
