### Understanding Embedded - FPGAs (Field Programmable Gate Array)

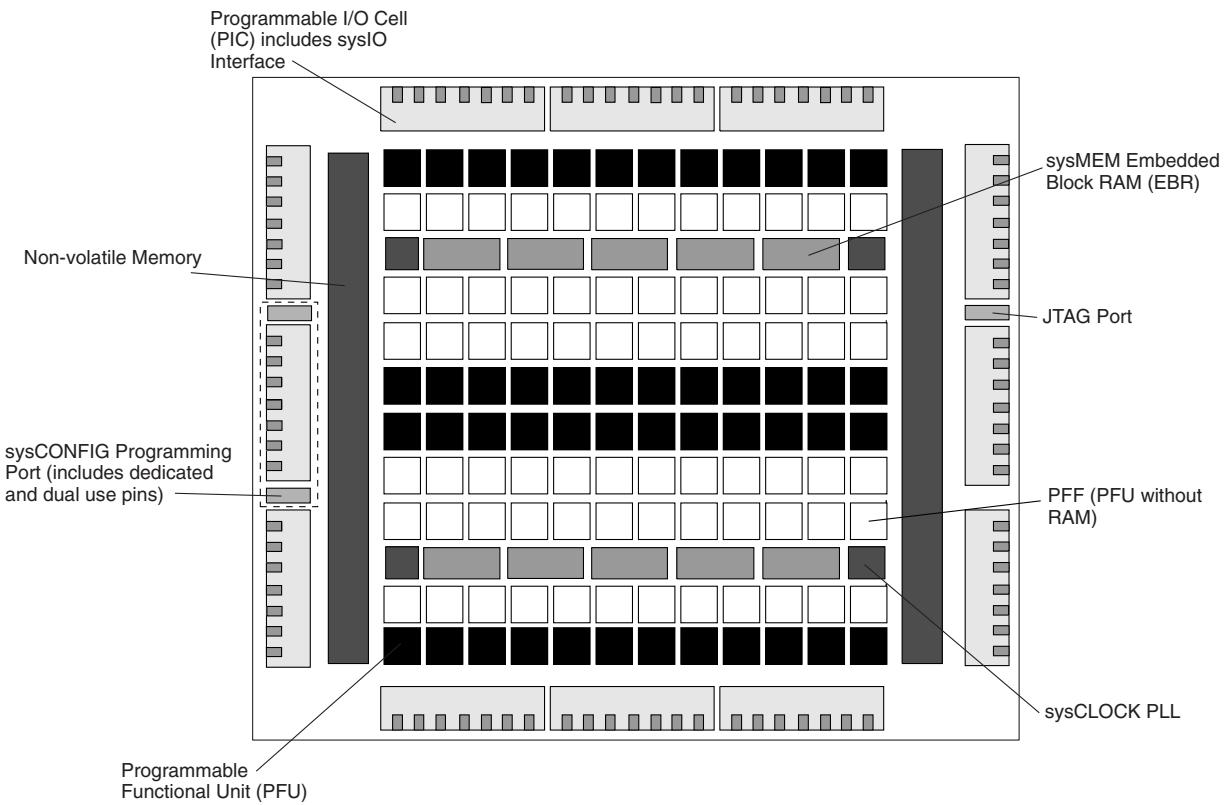

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### **Applications of Embedded - FPGAs**

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

#### **Details**

Product Status	Obsolete
Number of LABs/CLBs	-
Number of Logic Elements/Cells	6000
Total RAM Bits	73728
Number of I/O	142
Number of Gates	-
Voltage - Supply	1.14V ~ 1.26V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	208-BFQFP
Supplier Device Package	208-PQFP (28x28)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/lattice-semiconductor/lfxp6e-5q208c">https://www.e-xfl.com/product-detail/lattice-semiconductor/lfxp6e-5q208c</a>

**Figure 2-1. LatticeXP Top Level Block Diagram**

## PFU and PFF Blocks

The core of the LatticeXP devices consists of PFU and PFF blocks. The PFUs can be programmed to perform Logic, Arithmetic, Distributed RAM and Distributed ROM functions. PFF blocks can be programmed to perform Logic, Arithmetic and ROM functions. Except where necessary, the remainder of the data sheet will use the term PFU to refer to both PFU and PFF blocks.

Each PFU block consists of four interconnected slices, numbered 0-3 as shown in Figure 2-2. All the interconnections to and from PFU blocks are from routing. There are 53 inputs and 25 outputs associated with each PFU block.

**Figure 2-2. PFU Diagram**

**Figure 2-25. Tristate Register Block**

### Control Logic Block

The control logic block allows the selection and modification of control signals for use in the PIO block. A clock is selected from one of the clock signals provided from the general purpose routing and a DQS signal provided from the programmable DQS pin. The clock can optionally be inverted.

The clock enable and local reset signals are selected from the routing and optionally inverted. The global tristate signal is passed through this block.

### DDR Memory Support

Implementing high performance DDR memory interfaces requires dedicated DDR register structures in the input (for read operations) and in the output (for write operations). As indicated in the PIO Logic section, the LatticeXP devices provide this capability. In addition to these registers, the LatticeXP devices contain two elements to simplify the design of input structures for read operations: the DQS delay block and polarity control logic.

### DLL Calibrated DQS Delay Block

Source Synchronous interfaces generally require the input clock to be adjusted in order to correctly capture data at the input register. For most interfaces a PLL is used for this adjustment, however in DDR memories the clock (referred to as DQS) is not free running so this approach cannot be used. The DQS Delay block provides the required clock alignment for DDR memory interfaces.

The DQS signal (selected PIOs only) feeds from the PAD through a DQS delay element to a dedicated DQS routing resource. The DQS signal also feeds the polarity control logic which controls the polarity of the clock to the sync registers in the input register blocks. Figures 2-26 and 2-27 show how the polarity control logic are routed to the PIOs.

The temperature, voltage and process variations of the DQS delay block are compensated by a set of calibration (6-bit bus) signals from two DLLs on opposite sides of the device. Each DLL compensates DQS Delays in its half of the device as shown in Figure 2-27. The DLL loop is compensated for temperature, voltage and process variations by the system clock and feedback loop.

**Table 2-9. Characteristics of Normal, Off and Sleep Modes**

Characteristic	Normal	Off	Sleep
SLEEPN Pin	High	—	Low
Static I <sub>cc</sub>	Typical <100mA	0	Typical <100uA
I/O Leakage	<10μA	<1mA	<10μA
Power Supplies V <sub>CC</sub> /V <sub>CCIO</sub> /V <sub>CCAUX</sub>	Normal Range	Off	Normal Range
Logic Operation	User Defined	Non Operational	Non operational
I/O Operation	User Defined	Tri-state	Tri-state
JTAG and Programming circuitry	Operational	Non-operational	Non-operational
EBR Contents and Registers	Maintained	Non-maintained	Non-maintained

## SLEEPN Pin Characteristics

The SLEEPN pin behaves as an LVCMOS input with the voltage standard appropriate to the V<sub>CC</sub> supply for the device. This pin also has a weak pull-up typically in the order of 10μA along with a Schmidt trigger and glitch filter to prevent false triggering. An external pull-up to V<sub>CC</sub> is recommended when Sleep Mode is not used to ensure the device stays in normal operation mode. Typically the device enters Sleep Mode several hundred ns after SLEEPN is held at a valid low and restarts normal operation as specified in the Sleep Mode Timing table. The AC and DC specifications portion of this data sheet show a detailed timing diagram.

## Configuration and Testing

The following section describes the configuration and testing features of the LatticeXP family of devices.

### IEEE 1149.1-Compliant Boundary Scan Testability

All LatticeXP devices have boundary scan cells that are accessed through an IEEE 1149.1 compliant test access port (TAP). This allows functional testing of the circuit board, on which the device is mounted, through a serial scan path that can access all critical logic nodes. Internal registers are linked internally, allowing test data to be shifted in and loaded directly onto test nodes, or test data to be captured and shifted out for verification. The test access port consists of dedicated I/Os: TDI, TDO, TCK and TMS. The test access port has its own supply voltage V<sub>CCJ</sub> and can operate with LVCMOS3.3, 2.5, 1.8, 1.5 and 1.2 standards.

For more details on boundary scan test, please see information regarding additional technical documentation at the end of this data sheet.

### Device Configuration

All LatticeXP devices contain two possible ports that can be used for device configuration and programming. The test access port (TAP), which supports serial configuration, and the sysCONFIG port that supports both byte-wide and serial configuration.

The non-volatile memory in the LatticeXP can be configured in three different modes:

- In sysCONFIG mode via the sysCONFIG port. Note this can also be done in background mode.
- In 1532 mode via the 1149.1 port.
- In background mode via the 1149.1 port. This allows the device to be operated while reprogramming takes place.

The SRAM configuration memory can be configured in three different ways:

- At power-up via the on-chip non-volatile memory.
- In 1532 mode via the 1149.1 port SRAM direct configuration.
- In sysCONFIG mode via the sysCONFIG port SRAM direct configuration.

Figure 2-29 provides a pictorial representation of the different programming ports and modes available in the Lattice eXP devices.

On power-up, the FPGA SRAM is ready to be configured with the sysCONFIG port active. The IEEE 1149.1 serial mode can be activated any time after power-up by sending the appropriate command through the TAP port.

### Leave Alone I/O

When using 1532 mode for non-volatile memory programming, users may specify I/Os as high, low, tristated or held at current value. This provides excellent flexibility for implementing systems where reprogramming occurs on-the-fly.

### TransFR (Transparent Field Reconfiguration)

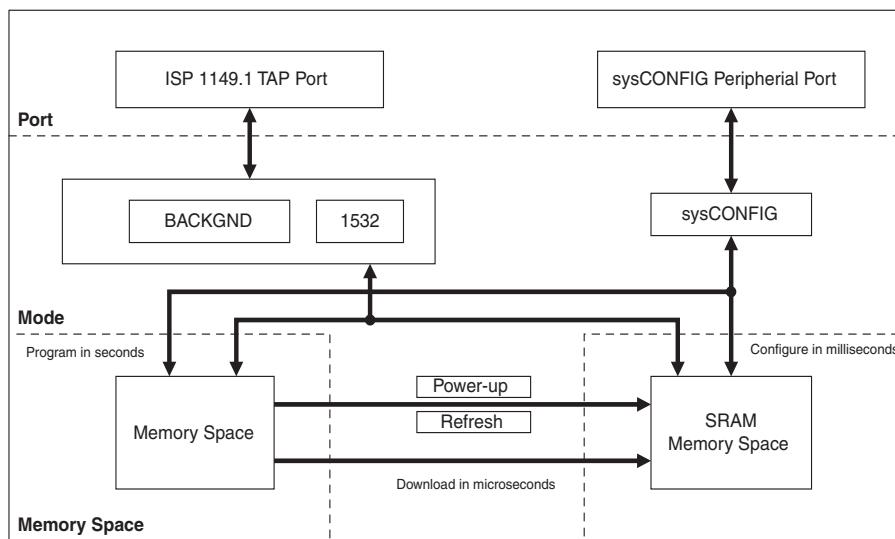

TransFR (TFR) is a unique Lattice technology that allows users to update their logic in the field without interrupting system operation using a single ispVM command. See Lattice technical note #TN1087, *Minimizing System Interruption During Configuration Using TransFR Technology*, for details.

### Security

The LatticeXP devices contain security bits that, when set, prevent the readback of the SRAM configuration and non-volatile memory spaces. Once set, the only way to clear security bits is to erase the memory space.

For more information on device configuration, please see details of additional technical documentation at the end of this data sheet.

**Figure 2-29. ispXP Block Diagram**

### Internal Logic Analyzer Capability (ispTRACY)

All LatticeXP devices support an internal logic analyzer diagnostic feature. The diagnostic features provide capabilities similar to an external logic analyzer, such as programmable event and trigger condition and deep trace memory. This feature is enabled by Lattice's ispTRACY. The ispTRACY utility is added into the user design at compile time.

For more information on ispTRACY, please see information regarding additional technical documentation at the end of this data sheet.

### Oscillator

Every LatticeXP device has an internal CMOS oscillator which is used to derive a master serial clock for configuration. The oscillator and the master serial clock run continuously in the configuration mode. The default value of the

1. Applies to LFXP "C" only.
2. Applies to LFXP "E" only.
3. Supports dedicated LVDS outputs.

# LatticeXP Family Data Sheet

## Ordering Information

December 2005

Data Sheet DS1001

### Part Number Description

### Ordering Information (Contact Factory for Specific Device Availability)

Note: LatticeXP devices are dual marked. For example, the commercial speed grade LFXP10E-4F256C is also marked with industrial grade -3I (LFXP10E-3F256I). The commercial grade is one speed grade faster than the associated dual mark industrial grade. The slowest commercial speed grade does not have industrial markings. The markings appear as follows:
