

Welcome to **E-XFL.COM**

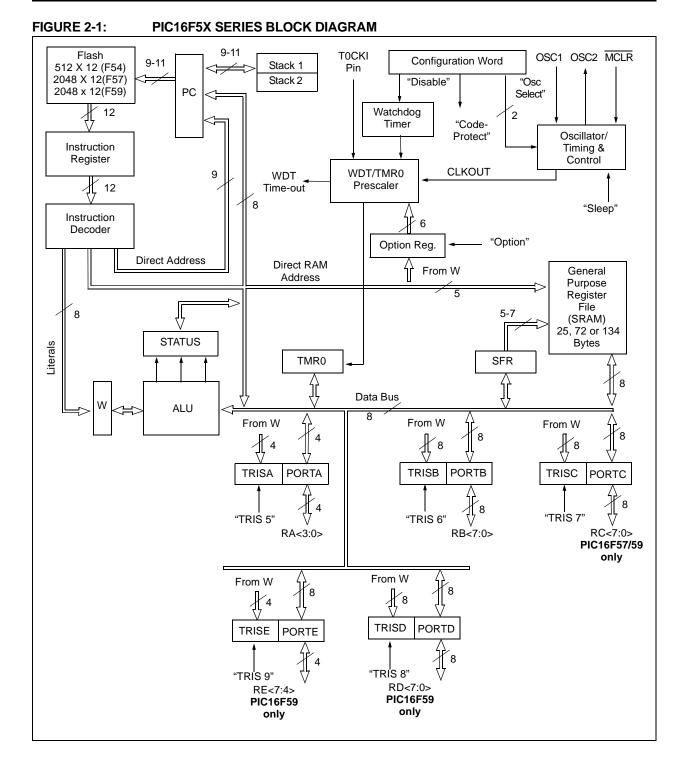

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "<u>Embedded - Microcontrollers</u>"

NOTES:

4.0 OSCILLATOR CONFIGURATIONS

4.1 Oscillator Types

The PIC16F5X devices can be operated in four different oscillator modes. The user can program two Configuration bits (FOSC1:FOSC0) to select one of these four modes:

LP: Low-power Crystal

• XT: Crystal/Resonator

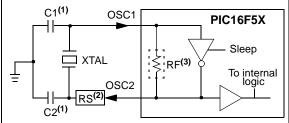

• HS: High-speed Crystal/Resonator

RC: Resistor/Capacitor

4.2 Crystal Oscillator/Ceramic Resonators

In XT, LP or HS modes, a crystal or ceramic resonator is connected to the OSC1/CLKIN and OSC2/CLKOUT pins to establish oscillation (Figure 4-1). The PIC16F5X oscillator design requires the use of a parallel cut crystal. Use of a series cut crystal may give a frequency outside of the crystal manufacturers specifications. When in XT, LP or HS modes, the device can have an external clock source drive the OSC1/CLKIN pin (Figure 4-2).

FIGURE 4-1: CRYSTAL/CERAMIC
RESONATOR OPERATION
(HS, XT OR LP OSC
CONFIGURATION)

Note 1: See Capacitor Selection tables for recommended values of C1 and C2.

2: A series resistor (RS) may be required.

3: RF varies with the Oscillator mode chosen (approx. value = 10 M Ω).

FIGURE 4-2: EXTERNAL CLOCK INPUT OPERATION (HS, XT OR LP OSC CONFIGURATION)

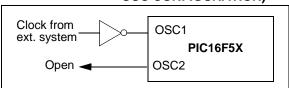

TABLE 4-1: CAPACITOR SELECTION FOR CERAMIC RESONATORS

Osc Type	Resonator Freq.	Cap. Range C1	Cap. Range C2					
XT	455 kHz	68-100 pF	68-100 pF					
	2.0 MHz	15-33 pF	15-33 pF					
	4.0 MHz	10-22 pF	10-22 pF					
HS	8.0 MHz	10-22 pF	10-22 pF					
	16.0 MHz	10 pF	10 pF					

These values are for design guidance only. Since each resonator has its own characteristics, the user should consult the resonator manufacturer for appropriate values of external components.

TABLE 4-2: CAPACITOR SELECTION FOR CRYSTAL OSCILLATOR

Osc Type	Crystal Freq.	Cap.Range C1	Cap. Range C2
LP	32 kHz ⁽¹⁾	15 pF	15 pF
XT	100 kHz	15-30 pF	200-300 pF
	200 kHz	15-30 pF	100-200 pF
	455 kHz	15-30 pF	15-100 pF
	1 MHz	15-30 pF	15-30 pF
	2 MHz	15 pF	15 pF
	4 MHz	15 pF	15 pF
HS	4 MHz	15 pF	15 pF
	8 MHz	15 pF	15 pF
	20 MHz	15 pF	15 pF

Note 1: For VDD > 4.5V, C1 = C2 \approx 30 pF is recommended.

These values are for design guidance only. Rs may be required in HS mode, as well as XT mode, to avoid overdriving crystals with low drive level specifications. Since each crystal has its own characteristics, the user should consult the crystal manufacturer for appropriate values of external components.

Note 1: This device has been designed to perform to the parameters of its data sheet. It has been tested to an electrical specification designed to determine its conformance with these parameters. Due to process differences in the manufacture of this device, this device may have different performance characteristics than its earlier version. These differences may cause this device to perform differently in your application than the earlier version of this device.

2: The user should verify that the device oscillator starts and performs as expected. Adjusting the loading capacitor values and/or the Oscillator mode may be required.

TABLE 5-3: RESET CONDITIONS FOR ALL REGISTERS

PORTD ⁽⁵⁾	08h	xxxx xxxx	uuuu uuuu
PORTE ⁽⁵⁾	09h	xxxx	uuuu

Legend: u = unchanged, x = unknown, - = unimplemented, read as '0', q = see tables in Table 5-1 for possible values.

Note 1: PIC16F54 only.

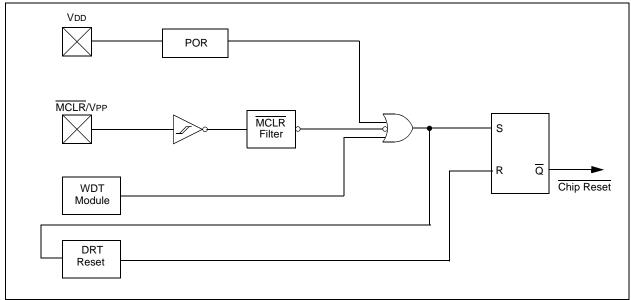

2: PIC16F57 only.

3: PIC16F59 only.

4: General purpose register file on PIC16F54.

5: General purpose register file on PIC16F54 and PIC16F57.

FIGURE 5-1: SIMPLIFIED BLOCK DIAGRAM OF ON-CHIP RESET CIRCUIT

8.0 SPECIAL FEATURES OF THE CPU

What sets a microcontroller apart from other processors are special circuits that deal with the needs of real-time applications. The PIC16F5X family of microcontrollers have a host of such features intended to maximize system reliability, minimize cost through elimination of external components, provide power-saving operating modes and offer code protection. These features are:

- Oscillator Selection
- Reset
- · Power-on Reset
- · Device Reset Timer
- Watchdog Timer (WDT)
- Sleep
- · Code protection
- · User ID locations
- In-Circuit Serial Programming[™] (ICSP[™])

The PIC16F5X family has a Watchdog Timer which can be shut off only through Configuration bit WDTE. It runs off of its own RC oscillator for added reliability. There is an 18 ms delay provided by the Device Reset Timer (DRT), intended to keep the chip in Reset until the crystal oscillator is stable. With this timer on-chip, most applications need no external Reset circuitry.

The Sleep mode is designed to offer a very low-current Power-down mode. The user can wake-up from Sleep through external Reset or through a Watchdog Timer time-out. Several oscillator options are also made available to allow the part to fit the application. The RC oscillator option saves system cost, while the LP crystal option saves power. A set of Configuration bits are used to select various options.

8.1 Configuration Bits

Configuration bits can be programmed to select various device configurations. Two bits are for the selection of the oscillator type; one bit is the Watchdog Timer enable bit; one bit is for code protection for the PIC16F5X devices (Register 8-1).

REGISTER 8-1: CONFIGURATION WORD FOR PIC16F5X

_	_	_	_	_	_	_	_	CP	WDTE	FOSC1	FOSC0	ı
hit 11											hit ∩	

bit 11-4: Unimplemented: Read as '1'

bit 3: **CP:** Code Protection bit.

1 = Code protection off0 = Code protection on

bit 2: WDTE: Watchdog Timer Enable bit

1 = WDT enabled0 = WDT disabled

bit 1-0: FOSC1:FOSC0: Oscillator Selection bits

00 = LP oscillator 01 = XT oscillator 10 = HS oscillator 11 = RC oscillator

Note 1: Refer to the PIC16F54, PIC16F57 and PIC16F59 Programming Specifications to determine how to access the Configuration Word. These documents can be found on the Microchip web site at www.microchip.com.

Legend:R = Readable bitW = Writable bitU = Unimplemented bit, read as '0'-n = Value at POR'1' = bit is set'0' = bit is clearedx = bit is unknown

8.2 Watchdog Timer (WDT)

The Watchdog Timer (WDT) is a free running on-chip RC oscillator which does not require any external components. This RC oscillator is separate from the RC oscillator of the OSC1/CLKIN pin. That means that the WDT will run even if the clock on the OSC1/CLKIN and OSC2/CLKOUT pins have been stopped, for example, by execution of a SLEEP instruction. During normal operation or Sleep, a WDT Reset or Wake-up Reset generates a device Reset.

The $\overline{\text{TO}}$ bit (STATUS<4>) will be cleared upon a Watchdog Timer Reset (Section 3.3 "STATUS Register").

The WDT can be permanently disabled by programming the Configuration bit WDTE as a '0' (Section 8.1 "Configuration Bits"). Refer to the PIC16F54 and PIC16F57 Programming Specifications to determine how to access the Configuration Word. These documents can be found on the Microchip web site at www.microchip.com.

8.2.1 WDT PERIOD

An 8-bit counter is available as a prescaler for the Timer0 module (**Section 7.2 "Prescaler"**), or as a postscaler for the Watchdog Timer (WDT), respectively. For simplicity, this counter is being referred to as "prescaler" throughout this data sheet.

Note: The prescaler may be used by either the Timer0 module or the WDT, but not both. Thus, a prescaler assignment for the Timer0 module means that there is no prescaler for the WDT, and vice-versa.

The PSA and PS<2:0> bits (OPTION<3:0>) determine prescaler assignment and prescale ratio (Section 3.4 "Option Register").

The WDT has a nominal time-out period of 18 ms (with no prescaler). If a longer time-out period is desired, a prescaler with a division ratio of up to 1:128 can be assigned to the WDT (under software control) by writing to the Option register. Thus time-out, a period of a nominal 2.3 seconds, can be realized. These periods vary with temperature, VDD and part-to-part process variations (see Device Characterization).

Under worst case conditions (VDD = Min., Temperature = Max., WDT prescaler = 1:128), it may take several seconds before a WDT time-out occurs.

8.2.2 WDT PROGRAMMING CONSIDERATIONS

The CLRWDT instruction clears the WDT and the prescaler, if assigned to the WDT, and prevents it from timing out and generating a device Reset.

The SLEEP instruction resets the WDT and the prescaler, if assigned to the WDT. This gives the maximum Sleep time before a WDT Wake-up Reset.

FIGURE 8-1: WATCHDOG TIMER BLOCK DIAGRAM

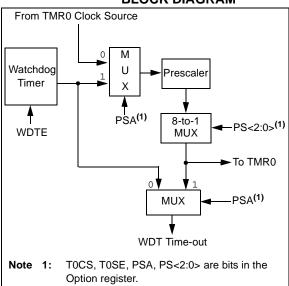

TABLE 8-1: SUMMARY OF REGISTERS ASSOCIATED WITH THE WATCHDOG TIMER

Address	Name	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Value on Power-on Reset	Value on MCLR and WDT Reset
N/A	OPTION	_	_	T0CS	T0SE	PSA	PS2	PS1	PS0	11 1111	11 1111

Legend: Shaded cells not used by Watchdog Timer, - = unimplemented, read as '0', u = unchanged

XORLW	k	Exclusive OR Literal to W	1	1111	kkkk	kkkk	Z	

- **Note 1:** The 9th bit of the program counter will be forced to a '0' by any instruction that writes to the PC except for GOTO (see **Section 3.5 "Program Counter"** for more on program counter).
 - 2: When an I/O register is modified as a function of itself (e.g., MOVF PORTB, 1), the value used will be that value present on the pins themselves. For example, if the data latch is '1' for a pin configured as input and is driven low by an external device, the data will be written back with a '0'.
 - **3:** The instruction TRIS f, where f = 5, 6 or 7 causes the contents of the W register to be written to the tri-state latches of PORTA, B or C, respectively. A '1' forces the pin to a high-impedance state and disables the output buffers.
 - **4:** If this instruction is executed on the TMR0 register (and, where applicable, d = 1), the prescaler will be cleared (if assigned to TMR0).

GOTO	Unconditional Branch								
Syntax:	[label] GOTO k								
Operands:	$0 \le k \le 511$								
Operation:	$k \rightarrow PC < 8:0>$; STATUS<6:5> $\rightarrow PC < 10:9>$								
Status Affected:	None								
Encoding:	101k kkkk kkkk								
Description:	GOTO is an unconditional branch. The 9-bit immediate value is loaded into PC bits <8:0>. The upper bits of PC are loaded from STATUS<6:5>. GOTO is a two-cycle instruction.								
Words:	1								
Cycles:	2								
Example: GOTO THERE									
After Instruction PC = address (THERE)									

INCF	Increment f
Syntax:	[label] INCF f, d
Operands:	$0 \le f \le 31$ $d \in [0,1]$
Operation:	$(f) + 1 \rightarrow (dest)$
Status Affected:	Z
Encoding:	0010 10df ffff
Description:	The contents of register 'f' are incremented. If 'd' is '0', the result is placed in the W register. If 'd' is '1', the result is placed back in register 'f'.
Words:	1
Cycles:	1
Example:	INCF CNT, 1
Before Instru CNT Z After Instruct CNT Z	= 0xFF = 0

INCFSZ	Increment f, Skip if 0							
Syntax:	[label] INCFSZ f, d							
Operands:	$0 \le f \le 31$ $d \in [0,1]$							
Operation:	(f) + 1 \rightarrow (dest), skip if result = 0							
Status Affected:	None							
Encoding:	0011 11df ffff							
Description:	The contents of register 'f' are incremented. If 'd' is '0', the result is placed in the W register. If 'd' is '1', the result is placed back in register 'f'. If the result is '0', then the next instruction, which is already fetched, is discarded and a NOP is executed instead making it a two-cycle instruction.							
Words:	1							
Cycles:	1(2)							
Example:	HERE INCFSZ CNT, 1 GOTO LOOP							
	CONTINUE •							
Before Instruct PC After Instruct CNT if CNT PC if CNT PC	= address (HERE)							

SUBWF	Subtract W from f	SWAPF	Swap Nibbles in f
Syntax:	[label] SUBWF f, d	Syntax:	[label] SWAPF f, d
Operands:	$0 \le f \le 31$ $d \in [0,1]$	Operands:	$0 \le f \le 31$ $d \in [0,1]$
Operation:	$ (f) - (W) \rightarrow (dest) $	Operation:	$(f<3:0>) \rightarrow (dest<7:4>);$ $(f<7:4>) \rightarrow (dest<3:0>)$
Status Affected:	C, DC, Z	Status Affected:	None
Encoding:	0000 10df ffff	Encoding:	0011 10df ffff
Description:	Subtract (2's complement method) the W register from register 'f'. If 'd'	Description:	The upper and lower nibbles of
	is '0', the result is stored in the W register. If 'd' is '1', the result is stored back in register 'f'.	Boompton	register 'f' are exchanged. If 'd' is '0', the result is placed in W register. If 'd' is '1', the result is
Words:	1		placed in register 'f'.
Cycles:	1	Words:	1
Example 1:	SUBWF REG1, 1	Cycles:	1
Before Instru	uction	Example:	SWAPF REG1, 0
REG1 W C	= 3 = 2 = ?	Before Instru REG1 After Instruc	= 0xA5
After Instruct		REG1 W	= 0xA5
REG1 W	= 1 = 2	VV	= 0x5A
C	= 1 ; result is positive		
Example 2:		TRIS	Load TRIS Register
Before Instru		Syntax:	[label] TRIS f
REG1 W	= 2 = 2	Operands:	f = 5, 6, 7, 8 or 9
Č	= ?	•	
After Instruc	tion	Operation:	(W) → TRIS register f
REG1	= 0	Status Affected:	None
W	= 2	Encoding:	0000 0000 Offf
C	= 1 ; result is zero	Description:	TRIS register 'f' $(f = 5, 6 \text{ or } 7)$ is
Example 3: Before Ins	truction		loaded with the contents of the W
REG1	= 1		register.
W	= 2	Words:	1
С	= ?	Cycles:	1
After Instruc		Example:	TRIS PORTB
REG1	= 0xFF	Before Instru	uction
W	= 2	W	= 0xA5
С	= 0 ; result is negative	After Instruc TRISB	tion = 0xA5

11.2 DC Characteristics: PIC16F5X (Extended)

			Standard Operating Conditions (unless otherwise specified) Operating Temperature -40 °C \leq Ta \leq +125°C for extended				
Param No.	Sym.	Characteristic/Device	Min.	Тур†	Max.	Units	Conditions
D001	Vdd	Supply Voltage	2.0	_	5.5	V	
D002	Vdr	RAM Data Retention Voltage ⁽¹⁾	_	1.5*	_	V	Device in Sleep mode
D003	VPOR	VDD Start Voltage to ensure Power-on Reset	_	Vss	_	V	See Section 5.1 "Power-on Reset (POR)" for details on Power-on Reset
D004	SVDD	VDD Rise Rate to ensure Power-on Reset	0.05*	_	_	V/ms	See Section 5.1 "Power-on Reset (POR)" for details on Power-on Reset
D010	IDD	Supply Current ⁽²⁾			•		
			_	170	450	μА	FOSC = 4 MHz, $VDD = 2.0V$, XT or RC mode ⁽³⁾
			_	0.4	2.0	mA	FOSC = 10 MHz, VDD = 3.0V, HS mode
			_	1.7	7.0	mA	FOSC = 20 MHz, VDD = 5.0V, HS mode
			_	15	40	μΑ	FOSC = 32 kHz, VDD = 2.0V, LP mode,
							WDT disabled
D020	IPD	Power-down Current ⁽²⁾					
			_	1.0	15.0	μΑ	VDD = 2.0V, WDT enabled
			_	0.5	8.0	μΑ	VDD = 2.0V, WDT disabled

- * These parameters are characterized but not tested.
- † Data in "Typ" column is based on characterization results at 25°C. This data is for design guidance only and is not tested.
- Note 1: This is the limit to which VDD can be lowered in Sleep mode without losing RAM data.
 - 2: The supply current is mainly a function of the operating voltage and frequency. Other factors such as bus loading, oscillator type, bus rate, internal code execution pattern and temperature, also have an impact on the current consumption.
 - a) The test conditions for all IDD measurements in Active Operation mode are: OSC1 = external square wave, from rail-to-rail; all I/O pins tri-stated, pulled to Vss, T0CKI = VDD, MCLR = VDD; WDT enabled/disabled as specified.
 - b) For standby current measurements, the conditions are the same, except that the device is in Sleep mode. The Power-down Current in Sleep mode does not depend on the oscillator type.
 - 3: Does not include current through REXT. The current through the resistor can be estimated by the formula: IR = VDD/2REXT (mA) with REXT in $k\Omega$.

11.3 DC Characteristics PIC16F5X

DC CHARACTERISTICS			Standard Operating Conditions (unless otherwise specified) Operating Temperature $-40^{\circ}\text{C} \le \text{TA} \le +85^{\circ}\text{C}$ for industrial $-40^{\circ}\text{C} \le \text{TA} \le +125^{\circ}\text{C}$ for extended				
Param No.	Sym.	Characteristic	Min.	Тур†	Max.	Units	Conditions

D092		OSC2/CLKOUT	VDD - 0.7	_	_	V	IOH = -1.3 mA, VDD = 4.5V
		(RC mode)					
	* The	oo paramatara ara abara			1		1

^{*} These parameters are characterized but not tested.

- 2: Negative current is defined as coming out of the pin.
- **3:** For the RC mode, the OSC1/CLKIN pin is a Schmitt Trigger input. It is not recommended that the PIC16F5X be driven with external clock in RC mode.

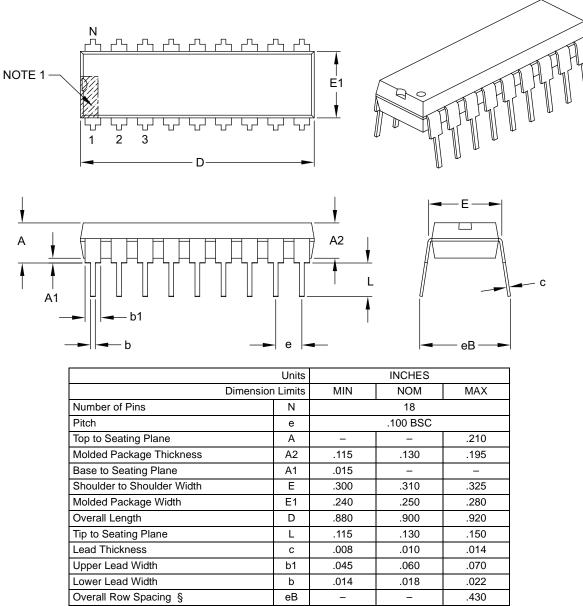

[†] Data in the Typical ("Typ") column is based on characterization results at 25°C. This data is for design guidance only and is not tested.

Note 1: The leakage current on the MCLR/VPP pin is strongly dependent on the applied voltage level. The specified levels represent normal operating conditions. Higher leakage current may be measured at different input voltage.

NOTES:

18-Lead Plastic Dual In-Line (P) – 300 mil Body [PDIP]

Note: For the most current package drawings, please see the Microchip Packaging Specification located at http://www.microchip.com/packaging

Notes:

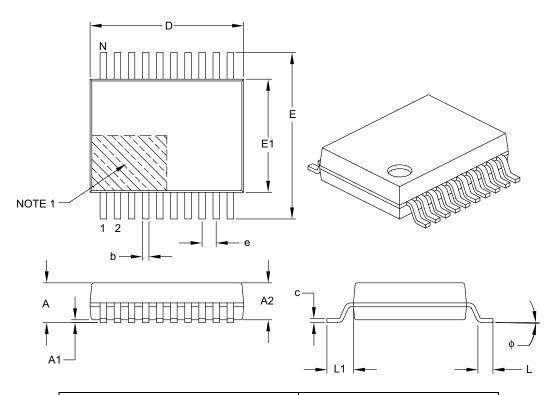

- 1. Pin 1 visual index feature may vary, but must be located within the hatched area.
- 2. § Significant Characteristic.
- 3. Dimensions D and E1 do not include mold flash or protrusions. Mold flash or protrusions shall not exceed .010" per side.
- 4. Dimensioning and tolerancing per ASME Y14.5M.

BSC: Basic Dimension. Theoretically exact value shown without tolerances.

Microchip Technology Drawing C04-076B

APPENDIX A: DATA SHEET REVISION HISTORY

Revision D (04/2007)

Changed PICmicro to PIC; Replaced Dev. Tool Section; Updated Package Marking Information and replaced Package Drawings (Rev. AP)

THE MICROCHIP WEB SITE

Microchip provides online support via our WWW site at www.microchip.com. This web site is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the web site contains the following information:

- Product Support Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- General Technical Support Frequently Asked Questions (FAQ), technical support requests, online discussion groups, Microchip consultant program member listing
- Business of Microchip Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

CUSTOMER CHANGE NOTIFICATION SERVICE

Microchip's customer notification service helps keep customers current on Microchip products. Subscribers will receive e-mail notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, access the Microchip web site at www.microchip.com, click on Customer Change Notification and follow the registration instructions.

CUSTOMER SUPPORT

Users of Microchip products can receive assistance through several channels:

- Distributor or Representative
- · Local Sales Office
- Field Application Engineer (FAE)
- Technical Support
- · Development Systems Information Line

Customers should contact their distributor, representative or field application engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

Technical support is available through the web site at: http://support.microchip.com

то.

READER RESPONSE

It is our intention to provide you with the best documentation possible to ensure successful use of your Microchip product. If you wish to provide your comments on organization, clarity, subject matter, and ways in which our documentation can better serve you, please FAX your comments to the Technical Publications Manager at (480) 792-4150.

Please list the following information, and use this outline to provide us with your comments about this document.

RE:	Reader Response	Total Pages Sent
