Understanding [Embedded - Microcontroller, Microprocessor, FPGA Modules](#)

Embedded - Microcontroller, Microprocessor, and FPGA Modules are fundamental components in modern electronic systems, offering a wide range of functionalities and capabilities. Microcontrollers are compact integrated circuits designed to execute specific control tasks within an embedded system. They typically include a processor, memory, and input/output peripherals on a single chip. Microprocessors, on the other hand, are more powerful processing units used in complex computing tasks, often requiring external memory and peripherals. FPGAs (Field Programmable Gate Arrays) are highly flexible devices that can be configured by the user to perform specific logic functions, making them invaluable in applications requiring customization and adaptability.

1. Overview of SOC SOM Modules

The SOC SOMs are small circuit boards with FPGA, DDRs, Flash, and clocks in one module to support FPGA-based systems. A module can be configured into a SOM by using the applicable firmware. The module is connected to a user PCB through a standard DDR3 SODIMM connector. Customers can order the blank SOMs from SOC and use their own firmware to make SOM products.

SOC configures the modules into MPEG codec SOMs for video/audio compression, decompression, and transcoding functions. Currently available modules are:

	Hardware Product Code	FPGA Chip on the Module	SOC Codec module Resolution Capacity
1	MCM-1000S	Spartan-6 XC6SLX150	H.264 or MPEG-2 HD up to 1080@30
2	MCM-1000A	Artix-7 XC7A200T	H.264 or MPEG-2 HD up to 1080@60
3	MCM-1000Z	Zynq-7 XC7Z035/045	H.264 4k@30/60, or H.265 HD up to 1080@60
4	MCM-1000SX	Arria-10 SX220/270/320/480/570/660	H.264 HD 1080@30/60, or H.264 4k@30/60, or H.265 HD up to 1080@60), or H.265 4k@30/60

Fig. 1 shows a photo of the modules. Fig. 2-5 shows the dimensions of MCM-1000S, MCM-1000A, MCM-1000Z, and MCM-1000SX respectively.

2. Connecting the Module to a User PCB

The MCM-1000S/A/Z/SX modules have identical edge pins that are compatible with standard DDR3 SODIMM connectors. The following off-the-shelf DDR3 SODIMM connectors can be used to connect the SOC codec modules onto a user PCB:

1. MM80-204B1-1
2. MM80-204B1-1E
3. AS0A621-U2SN-7F
4. AS0A621-H2S6-7H

Fig. 6 shows a photo of a standard 204 pin DDR3 SODIMM PCB connector. Refer to the datasheet of the connector used for the physical dimension and PCB design requirements.

Fig. 6 A photo of the standard 204 pin DDR3 SODIMM connector

3. Overview SOC Standard Codec Modules

Each of the above described SOMs: the **MCM-1000S** (based on Spatran-6 FPGA), **MCM-1000A** (based on Artix-7 FPGA), **MCM-1000Z** (based on Zynq-7 FPGAs), and **MCM-1000SX** (based on Altera Arria-10 FPGAs); can be configured into different products by down-loading the desired firmware. At SOC, we produce encoder, decoder, transcoder, and multi-channel encoder or decoder SOMs for video compressions, by down-loading **SOC MPEG Codec IP** cores onto the modules.

The standard encoder modules: H.265, H.264, and MPEG-2, take raw video and audio as input and output TS streams, via the edge pins of the modules, as shown in Fig. 7. The standard decoder modules: H.265, H.264, and MPEG-2, take TS stream as inputs and output decoded video and audio, via the edge pins of the modules, as shown in Fig. 8. There are also control signal pins, to allow the user control of the encoder or decoder.

4. The H.264 (and MPEG-2) HD Encoder Modules

4.1 Pin Assignments and Pin Voltages

The HD encoder modules for H.264 and MPEG-2 have the same pin assignments and electrical properties. The hardware module for HD resolution uses the MCM-1000A (the Artix-7 A200T FPGA), the hardware module MCM-1000Z is used for 4k resolutions (the Zynq-7035 for 4k@30, Zynq-7045 for 4k@60).

This Section provides the pin assignments and electrical properties for HD encoder (H.264, or MPEG-2) module which is based on the MCM-1000A. Table-1 lists the pin assignments and the pin voltages.

The schematics of MCM-1000A edge connector are attached in Appendix-B of this document, which shows the pin numbers for data, clock, control, and power. It should be noted that the encoder module uses only some of the edge pins, and not all of the edge pins are used.

Table-1 also lists the FPGA pin numbers that are connected to the edge pins assigned to the encoder. The Artix-7 datasheet provides further information regarding the properties of these pins, and can be used as a reference.

4.4 Power Requirement and Supply Amperage

The total power, at operation, required by a given encoder module ranges from 2 to 5 watts, depending on the resolution and frame rate. Since the total power is delivered over 6 power rails, each individual power rail deliveries only a portion of the total power. However, the power is not evenly distributed among the rails. Table-3 lists the power estimation by Xilinx Vivado FPGA software for each rail, at 1080p@60 resolution, which can be used as a reference for PCB design. It should be noted that the measured real power consumption is about 20% lower than the estimated power consumption.

It should be noted that the power rails of 1.8v is generated on the module, using the 2.5v power input from the edge pin. PCB designers need only to design the 6 power rails listed in Table-2, as the 1.8v is generated on the module.

Table-3: Power estimation for the encoder module (1080p@60 resolution)

Since the encoder module normally shares the power supplies with the carrier board (user PCB). The power design should be considered for both. SOC licenses the schematics of carrier boards, such as the VTR-S1000 and VTR-4000C discussed in Section 12 of this document. The reference designs provide not only the power system design, but also the I/O port designs, such as SDI, HDMI, Mini-USB, etc. Please contact SOC sale at: sales@soctechnologies.com for design licensing details.

5. The H.264 (and MPEG-2) HD Decoder Modules

5.1 Pin Assignments and Pin Voltages

The decoders for H.264 and MPEG-2 have the same pin assignment. The module for HD resolution decoding uses the MCM-1000A (with the Artix-7 A200T FPGA which is the same as the one used for the HD Encoder). The module MCM-1000Z is used for 4k decoding (the Zynq-7035 for 4k@30, Zynq-7045 for 4k@60).

This section details the pin assignments and pin voltages for the HD decoder (H.264, and MPEG-2) modules. Table-4 shows the pin assignments and the pin voltages.

The schematics of MCM-1000A edge connector are attached in Appendix-B of this document. Appendix-B shows the pin numbers for data, clock, control, and power, which are connected to the FPGA (Artix-7 XC7A200T). It should be noted that the decoder module uses only some of the available edge pins that are connected to the FPGA (some of the pins are not used).

It should also be noted that the HD encoder and decoder pin assignments are symmetrical, i.e. the video input pins on the encoder module become the video output pins on the decoder module.

5.2 Signal Formats

5.2.1 Clock Signals

The **Decoder Clock** signal (pin # 115) is an input clock for driving the decoder engine. The default frequency is **27MHz**. However, when an SDI port on the carrier board is used to send out the decoded video data, the SDI clock can be connected to the **Decoder Clock**. This will automatically synchronize the decoder outputs with the SDI interface.

The SDI clock frequencies are:

1. 27MHz, for SD resolution
2. 74.25MHz, for 720@60 and 1080@30
3. 148.5MHz, for 1080@60

The **Video Clock** signal (pin # 105) is the clock for the video data output by the decoder. The frequency of the **Video clock** is determined by the video resolution, which are:

4. 27MHz, for SD resolution
5. 74.25MHz, for 720@60 and 1080@30
6. 148.5MHz, for 1080@60.

5.2.2 Video Data Signals (Output)

The output of the HD decoder module (H.264 or MPEG-2) is the decoded video data in YUV format (4:2:2 or 4:2:0), with 10 input lines: **Video Data Luma[0]** to **Video Data Luma[9]**, for Luma and 10 lines. And, **Video Data Chroma[0]**

estimation by Xilinx Vivado FPGA software for each rail, at 1080p@60 resolution, and can be used as a reference for PCB design. It should be noted that the estimated total power showing in Table-5 is higher than the measured real power.

Again, the power rails of 1.8v is generated on the module, using the 2.5v power input from the edge pin. PCB designers need only to design the 6 power rails listed in Table-5.

Table-5: Power estimation for the decoder module (1080p@60 resolution)

6. The H.264 4k Encoder Modules

6.1 Pin Assignments and Pin Voltages

The modules for 4K resolution uses the MCM-1000Z hardware, with the MCM-1000Z35 (Zynq-7035 FPGA) for 4k@30 and MCM-1000Z45 (Zynq-7045 FPGA) for 4k@60. The pin assignment and electrical properties are the same for MCM-1000Z35 and MCM-1000Z45.

Table-6 lists the pin assignments and the pin voltages for the 4K encoder modules based on the MCM-1000Z (MCM-1000Z35 and MCM-1000Z45 are the same).

The schematics of MCM-1000Z edge connector are attached in Appendix-C of this document, which shows the pin numbers for data, clock, control, and power.

Table-6 also lists the FPGA pin numbers that are connected to the edge pins assigned to the encoder. The Zynq-7000 datasheet provides further information regarding the properties of these pins, and can be used as a reference.

7.2.2 Video Data Signals (Output)

The output of the H.264 4k decoder module is the decoded video data in YUV format (4:2:2 or 4:2:0), with 40 output lines: **Video Data 0 Luma[0]** to **Video Data 3 Luma[9]**, for Luma. And, 40 lines: **Video Data 0 Chroma[0]** to **Video Data 3 Chroma[9]**, for the Chroma. The precision can be either 8-bit precision or 10-bit precision. For 8-bit precision, the Most Significant Bits of luma and chroma output lines (Luma[2] to Luma[9], Chroma[2] to Chroma[9]) are used.

In addition to the video Luma and Chroma data signals, the **Video Horizontal Sync** and **Video Vertical Sync** signals are provided for frame synchronization. The **Video Display Enable signal** is a part of the **Video Horizontal Sync** and **Video Vertical Sync** system, where high signal indicates active video pixels.

7.2.3 Audio Data Signals (Output)

Line **SPDIF Audio** is for PCM audio output, in **SPDIF** frames. An **SPDIF** transmitter is included in the module to send the PCM data out via the decoder edge pins. Refer to the **SPDIF** protocol documents for details.

7.2.4 Decoder Control Signals (Input and output)

Uart_rx and **Uart_tx** are the API pins for controlling the operations of the decoder. **Uart_rx** receives the command from external control device. **Uart_tx** send the decoder information to the control device. Refer to the **Uart** standard for details of **Uart** operations. The SOC API User Manual provides the register map for the API control. Refer to the [Decoder API User Manual](#) for details.

7.3 Power Rails of MCM-1000Z

The power rails for H.264 4K decoder for 4k@30 or 4k@60 are the same and are also the same as the H.264 4k encoder. Refer to Appendix-C for the pins of power and ground on the edge connector of the MCM-1000Z module.

7.4 Power Requirement and Supply Amperage

The total power, at operation, required by a given encoder module ranges from 3 to 5 watts, depending on the resolution and frame rate. Since the total power is delivered over 6 power rails (1.0v, 1.2v, 1.3v, 1.5v, 2.5v, and 3.3v), each individual power rails deliveries only a portion of the total power. However, the power is not evenly distributed among the rails. Table-10 lists the power estimation by Xilinx Vivado FPGA software for each rail, at 4k@60 resolution, and can be used for PCB design. It should be noted that the power rails 1.8v and 2.0v are generated on the module using the input power rails. PCB designers for the carrier boards need not to consider these two rails.

Since the decoder module normally shares the power supplies with the carrier board (user PCB). The power design should be considered for both. SOC licenses the schematics of carrier boards. The VTR-4000C, discussed in Section

12. Carrier Board PCB Reference Designs

SOC has several evaluation boards for evaluating the standard encoder and decoder modules (and for evaluating the IP cores as well). These evaluation boards provide not only the DDR3 SODIMM connectors for connecting the encoder (and/or decoder) modules, but also the commonly used digital video/audio ports, such as SDI and HDMI. Ethernet port of tri-speed, 10/100/1000Mbps, as a network connection, is used in all of the SOC evaluation boards.

12.1 VTR-S1000 Evaluation Board

Fig. 11 shows a photo of the VTR-S1000 board. Major components and I/O ports are marked in the figure. Refer to the [User Guide of VTR -S1000](#) for further details.

SOC licenses the Schematics of VTR-S1000 to the customers that have purchased the eval kit VTR-S1000 and encoder (or decoder) Modules. Firmware of the VTR-S1000, including I/O drivers and network IP core, is also available for licensing. Please contact SOC sales, sales@soctechologies.com, for details.

A.9 Non-Standard Codec Modules

The previous section provides the information on SOC's factory standard MPEG codec modules. Customers can order modules based on customer specific requirements (non-standard modules). There is a Minimum Order Quantity (MOQ) required for customized configurations. Contact SOC sales sale@soctechnologies.com for information.
