Understanding [Embedded - Microcontroller, Microprocessor, FPGA Modules](#)

Embedded - Microcontroller, Microprocessor, and FPGA Modules are fundamental components in modern electronic systems, offering a wide range of functionalities and capabilities. Microcontrollers are compact integrated circuits designed to execute specific control tasks within an embedded system. They typically include a processor, memory, and input/output peripherals on a single chip. Microprocessors, on the other hand, are more powerful processing units used in complex computing tasks, often requiring external memory and peripherals. FPGAs (Field Programmable Gate Arrays) are highly flexible devices that can be configured by the user to perform specific logic functions, making them invaluable in applications requiring customization and adaptability.

2. Connecting the Module to a User PCB

The MCM-1000S/A/Z/SX modules have identical edge pins that are compatible with standard DDR3 SODIMM connectors. The following off-the-shelf DDR3 SODIMM connectors can be used to connect the SOC codec modules onto a user PCB:

1. MM80-204B1-1
2. MM80-204B1-1E
3. AS0A621-U2SN-7F
4. AS0A621-H2S6-7H

Fig. 6 shows a photo of a standard 204 pin DDR3 SODIMM PCB connector. Refer to the datasheet of the connector used for the physical dimension and PCB design requirements.

Appendix-A provides the details of the Standard Codec Modules, including the product tables which list the product codes along with the specifications. Customers can order the modules according the specifications required by using the corresponding product code.

The pin assignments, pin voltages, and signal formats for standard encoder and decoder modules are detailed respectively in this Datasheet in the following sections:

- Section 4: The H.264 (and MPEG-2) HD Encoder Modules
- Section 5: The H.264 (and MPEG-2) HD Decoder Modules
- Section 6: The H.264 4k Encoder Modules
- Section 7: The H.264 4k Decoder Modules
- Section 8: The H.265 HD Encoder Modules
- Section 9: The H.265 HD Decoder Modules (will be available soon)
- Section 10: The H.265 4k Encoder Modules
- Section 11: The H.265 4k Decoder Modules (will be available soon)

It should be noted that not all of the modules listed in Appendix-A are discussed in this Datasheet. Pin assignments and electrical properties for the modules that are not provided in the document, will be provided on demand basis.

SOC also offers customized modules according to customer requirements, such as Transcoder modules, Multi-channel encoder or decoder modules, and modules with non-standard I/Os. For details, contact SOC sales at: sales@soctechnologies.com

One of the popular extended versions of the standard codec modules is the –NET version which integrates the SOC low latency network stack (UDP/IP over Ethernet) into the encoder or decoder module. The pin assignments, pin voltages, and signal formats for the –NET version encoder and decoder modules are detailed in the document:

4.2 Signal Formats

4.2.1 Video Clock Signal (Input)

The **Video Clock** signal (pin # 105) has two functions: (1) It is the clock for the input video data, and (2) it is the clock that drives the encoder engine.

The **Video Clock** signal usually comes from the video input interface chip, such as HDMI or SDI. It is the clock for the input video data. It is also used for driving the encoder engine. The frequency varies according to the resolution of the video input. The following are the clock frequencies for standard video resolutions.

1. 27MHz, for SD resolution
2. 74.25MHz, for 720@60 and 1080@30
3. 148.5MHz, for 1080@60

4.2.2 Video Data Signals (Input)

The input to the encoder module (H.264 or MPEG-2) is raw video data in YUV format (4:2:2 or 4:2:0), with 10 input lines: **Video Data Luma[0]** to **Video Data Luma[9]**, for Luma. And, 10 input lines: **Video Data Chroma[0]** to **Video Data Chroma[9]**, for the Chroma. The precision can be either 8-bit or 10-bit. When 8-bit precision is used, **Video Data Luma[0]**, **Video Data Luma[1]**, **Video Data Chroma[0]**, and **Video Data Chroma[1]** are zeros.

In addition to the video Luma and Chroma data signals, the **Video Horizontal Sync** and **Video Vertical Sync** signals are required for frame synchronization. A **Video Clock** (refer to Section 4.2.1 for the clock frequencies) is required, which provides the timing for the parallel input of luma, chroma, as well as for the **Video Horizontal Sync** and **Video Vertical Sync** signals. The **Video Display Enable** signal (pin #150) is a part of the **Video Horizontal Sync** and **Video Vertical Sync** system, where high signal indicates active video pixels. For example, an HDMI input interface chip will output the **Display Enable signal** at high, when active pixels are being sent out.

The video data are sampled at the rising edge of the clock. The clock rates will correspond to the resolution and frame rate, as discussed in Section 4.2.1.

5. The H.264 (and MPEG-2) HD Decoder Modules

5.1 Pin Assignments and Pin Voltages

The decoders for H.264 and MPEG-2 have the same pin assignment. The module for HD resolution decoding uses the MCM-1000A (with the Artix-7 A200T FPGA which is the same as the one used for the HD Encoder). The module MCM-1000Z is used for 4k decoding (the Zynq-7035 for 4k@30, Zynq-7045 for 4k@60).

This section details the pin assignments and pin voltages for the HD decoder (H.264, and MPEG-2) modules. Table-4 shows the pin assignments and the pin voltages.

The schematics of MCM-1000A edge connector are attached in Appendix-B of this document. Appendix-B shows the pin numbers for data, clock, control, and power, which are connected to the FPGA (Artix-7 XC7A200T). It should be noted that the decoder module uses only some of the available edge pins that are connected to the FPGA (some of the pins are not used).

It should also be noted that the HD encoder and decoder pin assignments are symmetrical, i.e. the video input pins on the encoder module become the video output pins on the decoder module.

estimation by Xilinx Vivado FPGA software for each rail, at 1080p@60 resolution, and can be used as a reference for PCB design. It should be noted that the estimated total power showing in Table-5 is higher than the measured real power.

Again, the power rails of 1.8v is generated on the module, using the 2.5v power input from the edge pin. PCB designers need only to design the 6 power rails listed in Table-5.

6.2 Signal Formats

6.2.1 Clock Signals (Input)

The 4k encoder has 4 input clocks, **Video Clock 0** (pin # 63), **Video Clock 1** (pin # 80), **Video Clock 2** (pin # 144), and **Video Clock 3** (pin # 105). These clocks match the four of 3G SDI inputs for one 4k@30/60 video. However, if one 4k input is used on the carrier board, such as HDMI 2.0 or 12G SDI, only **Video Clock 0** is needed which takes the input video clock (74.5MHz for 4k@30, and 148.5 MHz for 4k@60).

6.2.2 Video Data Signals (Input)

The input to the encoder module is raw video data in YUV format (4:2:2 or 4:2:0), with 40 input lines: **Video Data 0 Luma[0]** to **Video Data 3 Luma[9]**, for Luma. And, 40 input lines: **Video Data 0 Chroma[0]** to **Video Data 3**

Chroma[9], for the Chroma. The precision is either 8 bits or 10 bits. For 8-bit precision, the Most Significant Luma and Chroma pins (Luma[2] to Luma[9], Chroma[2] to Chroma[9]) are used.

In addition to the video Luma and Chroma data signals, the **Video Horizontal Sync** and **Video Vertical Sync** signals are required for frame synchronization if embedded SAV/EAV are not used. The video clocks (refer to Section 6.2.1) provide the timing for the parallel input of luma, chroma, as well as the **Video Horizontal Sync** and **Video Vertical Sync** signals. The **Video Display Enable** signal is a part of the **Video Horizontal Sync** and **Video Vertical Sync** system, where high signal indicates active video pixels. For example, an HDMI input interface chip will output the **Video Display Enable** signal at high, when active pixels are being sent out.

The video data are sampled at the rising edge of the clock. The clock rates will correspond to the resolution and frame rate, as discussed in Section 6.2.1.

6.2.3 Audio Data Signals (Input)

Input line **SPDIF Audio** is for PCM audio input, in **SPDIF** frames. An **SPDIF** transmitter is required to send the PCM data to the encoder module. Refer to the **SPDIF** protocol documents for details.

6.2.4 TS stream Signals (Output)

The output of the encoder module is MPEG Transport Stream (TS), which is sent out from the module by 8 parallel lines: **Transport Stream Data[0]** to **Transport Stream Data[7]**, along with the Transport Stream output data clock **Transport Stream Clock** (pin # 31). The frequency of the Transport Stream Data clock is 27MHz.

Transport Stream Buffer Ready (pin # 28) and **Transport Stream Data Valid** (pin # 33) are the signals to inform the user side to take over the signals.

6.2.5 Encoder Control Signals (Input and Output)

Uart_rx and **Uart_tx** are the API pins for controlling the operations of the encoder. **Uart_rx** receives the command from external control device. **Uart_tx** sends the encoder information to the control device. Refer to the **Uart** standard for details of **Uart** operations. The SOC API User Manual provides the register map for the API control. Refer to the [Encoder API User Manual](#) for more details.

An external reset **PS Soft Reset_B** (pin # 156) is available. This pin allows the user to reset the encoder when necessary. A low signal will trigger a reset. The reset signal should be maintained at high or left unconnected when in normal operation mode.

6.3 Power Rails of MCM-1000Z

Refer to Appendix-B for the pins of power and ground on the edge connector of the MCM-1000Z module. The power rails are: 1.0V, 1.2V, 1.3V, 1.5V, 2.5V, and 3.3V.

6.4 Power Requirement and Supply Amperage

The total power, at operation, required by a given encoder module ranges from 3 to 6 watts, depending on the resolution and frame rate. Since the total power is delivered over 6 power rails (1.0v, 1.2v, 1.3v, 1.5v, 2.5v, and 3.3v), each individual power rails deliveries only a portion of the total power. However, the power is not evenly distributed among the rails. Table-7 lists the power estimation by Xilinx Vivado FPGA software for each rail, at 4k@60 resolution, which can be used as a reference for PCB design. It should be noted that the estimated total power showing in Table-7 is higher than the measured real power of the module. However, for PCB design purposes, Table-7 is sufficient. It should also be noted that the power rails 1.8v and 2.0v are generated on the module, by using some of the input power rails. Carrier board PCB designers need not to consider these two rails.

Table-7: Power estimation for the H.264 4k encoder module (4k@60 resolution)

7. The H.264 4K Decoder Modules

7.1 Pin Assignments and Pin Voltages

The modules for H.264 4K resolution use the MCM-1000Z, Zynq-7035 (for 4k@30) or Zynq-7045 (4k@60). This section details the pin assignment and pin voltages for H.264 4K decoder modules based on the MCM-1000Z hardware.

Table-8 shows the pin assignments and the pin voltages for H.264 4k decoder modules based on the MCM-1000Z.

The schematics of MCM-1000Z edge connector are attached in Appendix-C of this document. Appendix-C shows the pin numbers for data, clock, control, and power, which are connected to the FPGA (Zynq-7035 or 7045, which are pin-compatible).

It should be noted that the 4K encoder and decoder pin assignments are symmetrical, i.e. the video input pins on the encoder module become the video output pins on the decoder module.

7.2 Signal Formats

7.2.1 Video Clock Signal (Output)

The **Video Clock** signal (pin # 105) is the clock signal that provides the timing for the parallel luma, chroma, as well as the **Video Horizontal Sync** and **Video Vertical Sync** signals. The default is 148.5MHz for 4K@60 and 74.25MHz for 4K@30.

13. Ordering Information

Fig. 13 shows the product code naming convention for the SOC MPEG codec modules and IP cores. Non-standard codec modules can be ordered following the same naming format (minimum order quantity is required for non-standard modules).

Appendix-A Factory Standard Codec Modules

A.1 H.265 Encoder Modules

The H.265 encoder modules are based on either the MCM-1000SX or MCM-1000Z hardware. The SOC H.265 encoder IP cores of different configurations are used to configure the FPGAs on the hardware modules to produce the codec modules.

Table-A1 lists the product codes of the factory standard H.265 video encoder (video only) modules, along with the specifications for each module. Table-A2 lists the video/audio encoder modules. The hardware platform, MCM-1000SX or MCM-1000Z, is used for the H.265 video encoder. Customers can order the H.265 encoder modules using the product code, according to the specifications required by the application.

A.2 H.264 Encoder Modules

The H.264 encoder modules are based on either the on the MCM-1000A hardware. The SOC H.264 encoder IP cores are used to configure the FPGAs on the hardware modules to produce the codec modules.

Table-A3 lists the product code of the factory standard video encoder modules (video only), along with the specifications for each module. Table-A4 lists the video/audio encoder modules (both video and audio). Customers can order the encoder modules using the product code, according to the specifications required by the application.

A.7 H.264-to-MPEG2 Transcoder Modules

Table-A13 lists the standard H.264-to-MPEG2 video transcoder modules. Table-A14 lists the H.264-to-MPEG2 video/audio transcoder modules. The 60frames/second modules are offered as extensions of MPEG-2 standard.

Table-A13: H.264-to-MPEG2 Video Transcoder Modules (video only without audio):

Product #	Specifications							Hardware
	Standard	Profile	Resolution	Chroma	Precision	Frame Rate	Audio	
TC-V-H.264-to-MPEG2-8b-30-720-MZ	MPEG2	High	up to 720i/p	up to 4:2:2	8 bits	up to 30fps	no	MCM-1000Z
