Understanding Embedded - Microcontroller, Microprocessor, FPGA Modules

Embedded - Microcontroller, Microprocessor, and FPGA Modules are fundamental components in modern electronic systems, offering a wide range of functionalities and capabilities. Microcontrollers are compact integrated circuits designed to execute specific control tasks within an embedded system. They typically include a processor, memory, and input/output peripherals on a single chip. Microprocessors, on the other hand, are more powerful processing units used in complex computing tasks, often requiring external memory and peripherals. FPGAs (Field Programmable Gate Arrays) are highly flexible devices that can be configured by the user to perform specific logic functions, making them invaluable in applications requiring customization and adaptability.

1. Overview of SOC SOM Modules

The SOC SOMs are small circuit boards with FPGA, DDRs, Flash, and clocks in one module to support FPGA-based systems. A module can be configured into a SOM by using the applicable firmware. The module is connected to a user PCB through a standard DDR3 SODIMM connector. Customers can order the blank SOMs from SOC and use their own firmware to make SOM products.

SOC configures the modules into MPEG codec SOMs for video/audio compression, decompression, and transcoding functions. Currently available modules are:

	Hardware Product Code	FPGA Chip on the Module	SOC Codec module Resolution Capacity
1	MCM-1000S	Spartan-6 XC6SLX150	H.264 or MPEG-2 HD up to 1080@30
2	MCM-1000A	Artix-7 XC7A200T	H.264 or MPEG-2 HD up to 1080@60
3	MCM-1000Z	Zynq-7 XC7Z035/045	H.264 4k@30/60, or H.265 HD up to 1080@60
4	MCM-1000SX	Arria-10 SX220/270/320/480/570/660	H.264 HD 1080@30/60, or H.264 4k@30/60, or H.265 HD up to 1080@60), or H.265 4k@30/60

Fig. 1 shows a photo of the modules. Fig. 2-5 shows the dimensions of MCM-1000S, MCM-1000A, MCM-1000Z, and MCM-1000SX respectively.

2. Connecting the Module to a User PCB

The MCM-1000S/A/Z/SX modules have identical edge pins that are compatible with standard DDR3 SODIMM connectors. The following off-the-shelf DDR3 SODIMM connectors can be used to connect the SOC codec modules onto a user PCB:

1. MM80-204B1-1
2. MM80-204B1-1E
3. AS0A621-U2SN-7F
4. AS0A621-H2S6-7H

Fig. 6 shows a photo of a standard 204 pin DDR3 SODIMM PCB connector. Refer to the datasheet of the connector used for the physical dimension and PCB design requirements.

3. Overview SOC Standard Codec Modules

Each of the above described SOMs: the **MCM-1000S** (based on Spatran-6 FPGA), **MCM-1000A** (based on Artix-7 FPGA), **MCM-1000Z** (based on Zynq-7 FPGAs), and **MCM-1000SX** (based on Altera Arria-10 FPGAs); can be configured into different products by down-loading the desired firmware. At SOC, we produce encoder, decoder, transcoder, and multi-channel encoder or decoder SOMs for video compressions, by down-loading **SOC MPEG Codec IP** cores onto the modules.

The standard encoder modules: H.265, H.264, and MPEG-2, take raw video and audio as input and output TS streams, via the edge pins of the modules, as shown in Fig. 7. The standard decoder modules: H.265, H.264, and MPEG-2, take TS stream as inputs and output decoded video and audio, via the edge pins of the modules, as shown in Fig. 8. There are also control signal pins, to allow the user control of the encoder or decoder.

4. The H.264 (and MPEG-2) HD Encoder Modules

4.1 Pin Assignments and Pin Voltages

The HD encoder modules for H.264 and MPEG-2 have the same pin assignments and electrical properties. The hardware module for HD resolution uses the MCM-1000A (the Artix-7 A200T FPGA), the hardware module MCM-1000Z is used for 4k resolutions (the Zynq-7035 for 4k@30, Zynq-7045 for 4k@60).

This Section provides the pin assignments and electrical properties for HD encoder (H.264, or MPEG-2) module which is based on the MCM-1000A. Table-1 lists the pin assignments and the pin voltages.

The schematics of MCM-1000A edge connector are attached in Appendix-B of this document, which shows the pin numbers for data, clock, control, and power. It should be noted that the encoder module uses only some of the edge pins, and not all of the edge pins are used.

Table-1 also lists the FPGA pin numbers that are connected to the edge pins assigned to the encoder. The Artix-7 datasheet provides further information regarding the properties of these pins, and can be used as a r reference.

4.2 Signal Formats

4.2.1 Video Clock Signal (Input)

The **Video Clock** signal (pin # 105) has two functions: (1) It is the clock for the input video data, and (2) it is the clock that drives the encoder engine.

The **Video Clock** signal usually comes from the video input interface chip, such as HDMI or SDI. It is the clock for the input video data. It is also used for driving the encoder engine. The frequency varies according to the resolution of the video input. The following are the clock frequencies for standard video resolutions.

1. 27MHz, for SD resolution
2. 74.25MHz, for 720@60 and 1080@30
3. 148.5MHz, for 1080@60

4.2.2 Video Data Signals (Input)

The input to the encoder module (H.264 or MPEG-2) is raw video data in YUV format (4:2:2 or 4:2:0), with 10 input lines: **Video Data Luma[0]** to **Video Data Luma[9]**, for Luma. And, 10 input lines: **Video Data Chroma[0]** to **Video Data Chroma[9]**, for the Chroma. The precision can be either 8-bit or 10-bit. When 8-bit precision is used, **Video Data Luma[0]** , **Video Data Luma[1]**, **Video Data Chroma[0]**, and **Video Data Chroma[1]** are zeros.

In addition to the video Luma and Chroma data signals, the **Video Horizontal Sync** and **Video Vertical Sync** signals are required for frame synchronization. A **Video Clock** (refer to Section **4.2.1** for the clock frequencies) is required, which provides the timing for the parallel input of luma, chroma, as well as for the **Video Horizontal Sync** and **Video Vertical Sync signals**. The **Video Display Enable** signal (pin #150) is a part of the **Video Horizontal Sync** and **Video Vertical Sync** system, where high signal indicates active video pixels. For example, an HDMI input interface chip will output the **Display Enable signal** at high, when active pixels are being sent out.
The video data are sampled at the rising edge of the clock. The clock rates will correspond to the resolution and frame rate, as discussed in Section **4.2.1.**

4.4 Power Requirement and Supply Amperage

The total power, at operation, required by a given encoder module ranges from 2 to 5 watts, depending on the resolution and frame rate. Since the total power is delivered over 6 power rails, each individual power rail deliveries only a portion of the total power. However, the power is not evenly distributed among the rails. Table-3 lists the power estimation by Xilinx Vivado FPGA software for each rail, at 1080p@60 resolution, which can be used as a reference for PCB design. It should be noted that the measured real power consumption is about 20% lower than the estimated power consumption.

It should be noted that the power rails of 1.8v is generated on the module, using the 2.5v power input from the edge pin. PCB designers need only to design the 6 power rails listed in Table-2, as the 1.8v is generated on the module.

Table-3: Power estimation for the encoder module (1080p@60 resolution)

Since the encoder module normally shares the power supplies with the carrier board (user PCB). The power design should be considered for both. SOC licenses the schematics of carrier boards, such as the VTR-S1000 and VTR-4000C discussed in Section 12 of this document. The reference designs provide not only the power system design, but also the I/O port designs, such as SDI, HDMI, Mini-USB, etc. Please contact SOC sale at: sales@soctechnologies.com for design licensing details.

5. The H.264 (and MPEG-2) HD Decoder Modules

5.1 Pin Assignments and Pin Voltages

The decoders for H.264 and MPEG-2 have the same pin assignment. The module for HD resolution decoding uses the MCM-1000A (with the Artix-7 A200T FPGA which is the same as the one used for the HD Encoder). The module MCM-1000Z is used for 4k decoding (the Zynq-7035 for 4k@30, Zynq-7045 for 4k@60).

This section details the pin assignments and pin voltages for the HD decoder (H.264, and MPEG-2) modules. Table-4 shows the pin assignments and the pin voltages.

The schematics of MCM-1000A edge connector are attached in Appendix-B of this document. Appendix-B shows the pin numbers for data, clock, control, and power, which are connected to the FPGA (Artix-7 XC7A200T). It should be noted that the decoder module uses only some of the available edge pins that are connected to the FPGA (some of the pins are not used).

It should also be noted that the HD encoder and decoder pin assignments are symmetrical, i.e. the video input pins on the encoder module become the video output pins on the decoder module.

Table-4: HD Decoder Module (based on MCM-1000A) Pin Assignment

estimation by Xilinx Vivado FPGA software for each rail, at 1080p@60 resolution, and can be used as a reference for PCB design. It should be noted that the estimated total power showing in Table-5 is higher than the measured real power.

Again, the power rails of 1.8v is generated on the module, using the 2.5v power input from the edge pin. PCB designers need only to design the 6 power rails listed in Table-5.

6.2 Signal Formats

6.2.1 Clock Signals (Input)

The 4k encoder has 4 input clocks, **Video Clock 0** (pin # 63), **Video Clock 1** (pin # 80), **Video Clock 2** (pin # 144), and **Video Clock 3** (pin # 105). These clocks match the four of 3G SDI inputs for one 4k@30/60 video. However, if one 4k input is used on the carrier board, such as HDMI 2.0 or 12G SDI, only **Video Clock 0** is needed which takes the input video clock (74.5MHz for 4k@30, and 148.5 MHz for 4k@60).

6.2.2 Video Data Signals (Input)

The input to the encoder module is raw video data in YUV format (4:2:2 or 4:2:0), with 40 input lines: **Video Data 0 Luma[0]** to **Video Data 3 Luma[9]**, for Luma. And, 40 input lines: **Video Data 0 Chroma[0]** to **Video Data 3**

Chroma[9], for the Chroma. The precision is either 8 bits or 10 bits. For 8-bit precision, the Most Significant Luma and Chroma pins (Luma[2] to Luma[9], Chroma[2] to Chroma[9]) are used.

In addition to the video Luma and Chroma data signals, the **Video Horizontal Sync** and **Video Vertical Sync** signals are required for frame synchronization if embedded SAV/EAV are not used. The video clocks (refer to Section **6.2.1**) provide the timing for the parallel input of luma, chroma, as well as the **Video Horizontal Sync** and **Video Vertical Sync signals**. The **Video Display Enable** signal is a part of the **Video Horizontal Sync** and **Video Vertical Sync** system, where high signal indicates active video pixels. For example, an HDMI input interface chip will output the **Video Display Enable** signal at high, when active pixels are being sent out.

The video data are sampled at the rising edge of the clock. The clock rates will correspond to the resolution and frame rate, as discussed in Section **6.2.1.**

6.2.3 Audio Data Signals (Input)

Input line **SPDIF Audio** is for PCM audio input, in **SPDIF** frames. An **SPDIF** transmitter is required to send the PCM data to the encoder module. Refer to the **SPDIF** protocol documents for details.

6.2.4 TS stream Signals (Output)

The output of the encoder module is MPEG Transport Stream (TS), which is sent out from the module by 8 parallel lines: **Transport Stream Data[0]** to **Transport Stream Data[7],** along with the Transport Stream output data clock **Transport Stream Clock** (pin # 31). The frequency of the Transport Stream Data clock is 27MHz.

Transport Stream Buffer Ready (pin # 28) and **Transport Stream Data Valid** (pin # 33) are the signals to inform the user side to take over the signals.

6.2.5 Encoder Control Signals (Input and Output)

Uart_rx and **Uart_tx** are the API pins for controlling the operations of the encoder. **Uart_rx** receives the command from external control device. **Uart_tx** sends the encoder information to the control device. Refer to the **Uart** standard for details of **Uart** operations. The SOC API User Manual provides the register map for the API control. Refer to the Encoder API User Manual for more details.

An external reset **PS Soft Reset_B** (pin # 156) is available. This pin allows the user to reset the encoder when necessary. A low signal will trigger a reset. The reset signal should be maintained at high or left unconnected when in normal operation mode.

6.3 Power Rails of MCM-1000Z

Refer to Appendix-B for the pins of power and ground on the edge connector of the MCM-1000Z module. The power rails are: 1.0V, 1.2V, 1.3V, 1.5V, 2.5V, and 3.3V.

7. The H.264 4K Decoder Modules

7.1 Pin Assignments and Pin Voltages

The modules for H.264 4K resolution use the MCM-1000Z, Zynq-7035 (for 4k@30) or Zynq-7045 (4k@60). This section details the pin assignment and pin voltages for H.264 4K decoder modules based on the MCM-1000Z hardware.

Table-8 shows the pin assignments and the pin voltages for H.264 4k decoder modules based on the MCM-1000Z.

The schematics of MCM-1000Z edge connector are attached in Appendix-C of this document. Appendix-C shows the pin numbers for data, clock, control, and power, which are connected to the FPGA (Zynq-7035 or 7045, which are pin-compatible).

It should be noted that the 4K encoder and decoder pin assignments are symmetrical, i.e. the video input pins on the encoder module become the video output pins on the decoder module.

7.2 Signal Formats

7.2.1 Video Clock Signal (Output)

The **Video Clock** signal (pin # 105) is the clock signal that provides the timing for the parallel luma, chroma, as well as the **Video Horizontal Sync** and **Video Vertical Sync signals**. The default is 148.5MHz for 4K@60 and 74.25MHz for 4K@30.

13. Ordering Information

Fig. 13 shows the product code naming convention for the SOC MPEG codec modules and IP cores. Non-standard codec modules can be ordered following the same naming format (minimum order quantity is required for non-standard modules).

A.2 H.264 Encoder Modules

The H.264 encoder modules are based on either the on the MCM-1000A hardware. The SOC H.264 encoder IP cores are used to configure the FPGAs on the hardware modules to produce the codec modules.

Table-A3 lists the product code of the factory standard video encoder modules (video only), along with the specifications for each module. Table-A4 lists the video/audio encoder modules (both video and audio). Customers can order the encoder modules using the product code, according to the specifications required by the application.
