

Welcome to [E-XFL.COM](https://www.e-xfl.com)

What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "[Embedded - Microcontrollers](#)"

Details

Product Status	Active
Core Processor	ARM® Cortex®-M3
Core Size	32-Bit Single-Core
Speed	80MHz
Connectivity	I ² C, SPI, UART/USART
Peripherals	DMA, POR, PWM, WDT
Number of I/O	40
Program Memory Size	256KB (128K x 8 x 2)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	32K x 8
Voltage - Supply (Vcc/Vdd)	2.9V ~ 3.6V
Data Converters	A/D 16x14b; D/A 12x12b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 105°C (TA)
Mounting Type	Surface Mount
Package / Case	96-TFBGA, CSPBGA
Supplier Device Package	96-CSPBGA (6x6)
Purchase URL	https://www.e-xfl.com/product-detail/analog-devices/aducm320bbcz-rl

FUNCTIONAL BLOCK DIAGRAM

Figure 1.

GENERAL DESCRIPTION

The [ADuCM320](#) is a fully integrated single package device that incorporates high performance analog peripherals together with digital peripherals controlled by an 80 MHz ARM Cortex-M3 processor and integral flash for code and data.

The ADC on the [ADuCM320](#) provides 14-bit, 1 MSPS data acquisition on up to 16 input pins that can be programmed for single-ended or differential operation. The voltage at the IDAC output pins can also be measured by the ADC, which is useful for controlling the power consumption of the current DACs. Additionally, chip temperature and supply voltages can be measured.

The ADC input voltage is 0 V to VREF. A sequencer is provided, which allows a user to select a set of ADC channels to be measured in sequence without software involvement during the sequence. The sequence can optionally repeat automatically at a user selectable rate.

Up to eight VDACS are provided with output ranges that are programmable to one of two voltage ranges.

Four IDAC sources are provided. The output currents are programmable with ranges of 0 mA to 150 mA. A low drift band gap reference and voltage comparator completes the analog input peripheral set.

The [ADuCM320](#) can be configured so that the digital and analog outputs will retain their output voltages and currents through a watchdog or software reset sequence. Thus, a product can remain functional even while the [ADuCM320](#) is resetting itself.

The [ADuCM320](#) has a low power ARM Cortex-M3 processor and a 32-bit RISC machine that offers up to 100 MIPS peak performance. Also integrated on chip are 2 × 128 kB Flash/EE memory and 32 kB of SRAM. The flash comprises two separate 128 kB blocks supporting execution from one flash block and simultaneous writing/erasing of the other flash block.

The [ADuCM320](#) operates from an on-chip oscillator or a 16 MHz external crystal and a PLL at 80 MHz. This clock can

optionally be divided down to reduce current consumption. Additional low power modes can be set via software. In normal operating mode, the [ADuCM320](#) digital core consumes about 300 μ A per MHz.

The device includes an MDIO interface capable of operating at up to 4 MHz. The capability to simultaneously execute from one flash block and write/erase the other flash block makes the [ADuCM320](#) ideal for 10G, 40G, and 100G optical applications. User programming is eased by incorporating PHYADR and DEVADD hardware comparators. In addition, the nonerasable kernel code plus flags in user flash provide assistance by allowing user code to robustly switch between the two blocks of user flash code and data spaces.

The [ADuCM320](#) integrates a range of on-chip peripherals that can be configured under software control, as required in the application. These peripherals include 1 × UART, 2 × I²C, and 2 × SPI serial input/output communication controllers, GPIO, 32-element programmable logic array, 3 general-purpose timers, plus a wake-up timer and system watchdog timer. A 16-bit PWM with seven output channels is also provided.

GPIO pins on the device power up in high impedance input mode. In output mode, the software chooses between open-drain mode and push-pull mode. The pull-up resistors can be disabled and enabled in software. In GPIO output mode, the inputs can remain enabled to monitor the pins. The GPIO pins can also be programmed to handle digital or analog peripheral signals, in which case the pin characteristics are matched to the specific requirement.

A large support ecosystem is available for the ARM Cortex-M3 processor to ease product development of the [ADuCM320](#). Access is via the ARM serial wire debug port (SW-DP). On-chip factory firmware supports in-circuit serial download via MDIO. These features are incorporated into a low cost QuickStart development system supporting this precision analog microcontroller family.

Parameter	Symbol	Min	Typ	Max	Unit	Test Conditions/Comments
Full-Scale Error IDAC0, IDAC1				±0.75	%	IDAC set to 85% of full scale 25°C to 105°C range

OSCILLATORS						
Internal System Oscillator			16		MHz	
Accuracy			± 0.5	± 3	%	
System PLL			80		MHz	Main system clock
External Crystal Oscillator			16		MHz	Can be selected in place of internal oscillator
32 kHz Internal Oscillator			32.768		kHz	Use for watchdog
Accuracy			± 5	± 20	%	
External Clock		0.05		80	MHz	Can be selected in place of PLL
START-UP TIME						
At Power-On			40		ms	Processor clock = 80 MHz
After Other Reset			1.5		ms	POR to first user code execution
From All Power-Down Modes			1.25		μs	Reset to first user code execution

Parameter	Symbol	Min	Typ	Max	Unit	Test Conditions/Comments
PROGRAMMABLE LOGIC ARRAY	PLA					
Propagation Delay						
Pin			17		ns	From input pin to output pin
Element			1.5		ns	Per PLA cell
EXTERNAL INTERRUPTS						
Pulse Width ¹						
Level Triggered		7			ns	
Edge Triggered		1			ns	
POWER REQUIREMENTS ⁸						
Power Supply Voltage Range						
AVDDx to AGNDx and IOVDDx to DGNDx ¹		2.9	3.3	3.6	V	
Analog Power Supply Currents						
AVDDx Current			6.3		mA	Analog peripherals in idle mode
Digital Power Supply Current						
IOVDDx Current in Normal Mode			4		mA	All GPIO pull-up resistors enabled
VDDx Current						
Normal Mode ⁹			29		mA	CD = 0 (80 MHz clock) executing typical code
			20		mA	CD = 1 executing typical code
			10		mA	CD = 7 executing typical code
CORE_SLEEP Mode ⁹			16		mA	
SYS_SLEEP Mode ⁹			8		mA	
Hibernate Mode ⁹			6.6		mA	
Additional Power Supply Currents						
ADC			4.1		mA	Continuously converting at 100 kSPS
ADC Input Buffer			4.0		mA	Both buffers enabled
IDAC			16.5		mA	Excluding load current
DAC			340		μA	Per powered up DAC, excluding load current
Total Supply Current		35	40	45	mA	VDD1, IOVDDx, AVDDx connected together; condition when entering user code: peripheral clocks on, peripherals idle, no load currents
Thermal Performance						
Impedance Junction to Ambient			45		°C/W	JEDEC 2S2P

¹ These numbers are not production tested but are guaranteed by design and/or characterization data at production release.

² Enabling the input buffer changes the ADC input characteristics as described in this subsection.

³ The data in this section also applies for a load of $R_L = 1\text{ k}\Omega$ and $C_L = 100\text{ pF}$ to GND but only for 0 V to 2.5 V. However, this is not production tested.

⁴ DAC linearity is calculated using a reduced code range of 100 to 3900.

⁵ DAC gain error is calculated using a reduced code range of 100 to an internal $2.5\text{ V }V_{REF}$.

⁶ Due to self heating, internal temperature measurements cannot be used to predict external temperatures. This value is only relevant after user calibration and only for internal and external conditions identical to those at calibration.

⁷ The average current from all GPIO pins must not exceed 3 mA per pin.

⁸ Power figures exclude any load currents to external circuits.

⁹ See the ADuCM320 reference manual, [How to Set up and Use the ADuCM320](#).

AVDD = IOVDD = VDD1 = 2.9 V to 3.6 V maximum difference between supplies = 0.3 V, VREF = 2.5 V internal reference, $f_{\text{CORE}} = 80 \text{ MHz}$, $T_A = -40^\circ\text{C}$ to $+105^\circ\text{C}$, unless otherwise noted. PVDDx for IDACs = 1.8 V to 2.5 V. Power-up sequence must be VDD1, IOVDDx, AVDDx, and then PVDDx, but no delays in the sequence are required.

Table 2.

Parameter	Symbol	Min	Typ	Max	Unit	Test Conditions/Comments

ABSOLUTE MAXIMUM RATINGS

All requirements applicable to each pin must be met. Where multiple limits apply to a pin each one must be met individually. The limits apply according to the functionality of the pins at the time. Pins that can be either analog or digital, that is, that have two types indicated in the pin descriptions, must meet the limits for both types. For pin types, see Table 11.

When powered up, it is required that all ground pins plus ADC_REFN be connected together to a node referred to as GND in Table 10. The limits that are listed must be reduced by any difference between any GNDs. Also, it is required that AVDD3 is connected to AVDD4 and that IOVDD1 to IOVDD3 are connected together.

Table 10. Absolute Maximum Ratings

Parameter	Rating
Any Pin to GND	−0.3 V to +3.9 V
Any PVDDx Pin to GND	−0.3 V to +2.8 V
MDIO ¹ , MCK, and PRTADDR0-4 in MDIO Mode to GND	−0.3 V to +2.1 V
Between Any of AVDDx, IOVDDx, and VDD1 Pins	−0.3 V to +0.3 V
Any Type I Pin to GND ²	−0.3 V to IOVDDx + 0.3 V
Any Type AI or AO Pin to GND ³	−0.3 V to AVDDx + 0.3 V
Any IDACx, CDAMPx, IDACTST, IREF to GND	−0.3 V to PVDDx + 0.3 V
ADC_REFP to GND	−0.3 V to AVDDx + 0.3 V
Total Positive GPIO Pin Currents	0 mA to 30 mA
Total Negative GPIO Pin Currents	−30 mA to 0 mA
Maximum Power Dissipation	1 W
Operating Ambient Temperature Range	−40°C to +105°C
Storage Temperature Range	−65°C to +160°C
Operating Junction Temperature Range	−40°C to +120°C
ESD HBM	2 kV
ESD FICDM	1 kV

¹ Note this pin is always in MDIO mode.

² This limit does not apply if no current can be drawn by external circuits on IOVDDx because then IOVDD follows to a suitable level.

³ This limit does not apply if no current can be drawn by external circuits on AVDDx because then AVDD follows to a suitable level.

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

ESD CAUTION

ESD (electrostatic discharge) sensitive device.

Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

Pin No.	Mnemonic	Type ¹	Description
F3	P0.6/SCL1/PLAO[4]	I/O	Digital I/O Port 0.6 (P0.6). I ² C1 Serial Clock (SCL1). Output of PLA Element 4 (PLAO[4]).
F2	P0.7/SDA1/PLAO[5]	I/O	Digital I/O Port 0.7 (P0.7). I ² C1 Serial Data (SDA1). Output of PLA Element 5 (PLAO[5]).
B9	P1.0/SIN/ECLKIN/PLAI[4]	I/O	Digital I/O Port 1.0 (P1.0). UART Input (SIN). External Input Clock (ECLKIN). Input to PLA Element 4 (PLAI[4]).
B10	P1.1/SOUT/PLACK1/PLAI[5]	I/O	Digital I/O Port 1.1 (P1.1). UART Output (SOUT) PLA Clock 1 (PLACK1). Input to PLA Element 5 (PLAI[5]).
B11	P1.2/PWM0/PLAI[6]	I/O	Digital I/O Port 1.2 (P1.2). PWM Output 0 (PWM0). Input to PLA Element 6 (PLAI[6]).
C6	P1.3/PWM1/PLAI[7]	I/O	Digital I/O Port 1.3 (P1.3). PWM Output 1 (PWM1). Input to PLA Element 7 (PLAI[7]).
C7	P1.4/PWM2/SCLK1/PLAO[10]	I/O	Digital I/O Port 1.4 (P1.4). PWM Output 2 (PWM2). SPI1 Clock (SCLK1). Output of PLA Element 10 (PLAO[10]).
C8	P1.5/PWM3/MISO1/PLAO[11]	I/O	Digital I/O Port 1.5 (P1.5). PWM Output 3 (PWM3). SPI1 Master In, Slave Out (MISO1). Output of PLA Element 11 (PLAO[11]).
C9	P1.6/PWM4/MOSI1/PLAO[12]	I/O	Digital I/O Port 1.6 (P1.6). PWM Output 4 (PWM4). SPI1 Master Out, Slave Input (MOSI1). Output of PLA Element 12 (PLAO[12]).
C10	P1.7/IRQ1/PWM5/CS1/PLAO[13]	I/O	Digital I/O Port 1.7 (P1.7). External Interrupt 1 (IRQ1). PWM Output 5 (PWM5). SPI1 Chip Select 1 (CS1). When using SPI1, configure this pin as CS1. Output of PLA Element 13 (PLAO[13]).
C5	P2.0/IRQ2/PWMTRIP/PLACK2/PLAI[8]	I/O	Digital I/O Port 2.0 (P2.0). External Interrupt 2 (IRQ2). PWM Trip (PWMTRIP). PLA Input Clock 2 (PLACK2). Input to PLA Element 8 (PLAI[8]).
C4	P2.2/IRQ4/ $\overline{\text{POR}}$ /CLKOUT/PLAI[10]	I/O	Digital I/O Port 2.2 (P2.2). External Interrupt 4 (IRQ4). Reset Output ($\overline{\text{POR}}$). This pin function is an output and it is the default for Pin C4. Clock Output (CLKOUT). Input to PLA Element 10 (PLAI[10]).
C3	P2.3/BM	I/O	Digital I/O Port 2.3 (P2.3). Boot Mode (BM). This pin determines the start-up sequence after every reset. Pull-up is enabled at power-up.

Pin No.	Mnemonic	Type ¹	Description
D9	P2.4/IRQ5/ADCCONV/PWM6/PLAO[18]	I/O	Digital I/O Port 2.4 (P2.4). External Interrupt 5 (IRQ5). External Input to Start ADC Conversions (ADCCONV). PWM Output 6 (PWM6). Output of PLA Element 18 (PLAO[18]).
F1	P2.6/IRQ7/PLAO[20]	I/O	Digital I/O Port 2.6 (P2.6). External Interrupt 7 (IRQ7). Output of PLA Element 20 (PLAO[20]).
G1	P2.7/IRQ8/PLAO[21]	I/O	Digital I/O Port 2.7 (P2.7). External Interrupt 8 (IRQ8). Output of PLA Element 21 (PLAO[21]).
G3	P3.0/PRTADDR0/PLAI[12]	I/O	Digital I/O Port 3.0 (P3.0). MDIO Port Address Bit 0 (PRTADDR0). See the digital inputs parameter in Table 1 for details. Input to PLA Element 12 (PLAI[12]).
G2	P3.1/PRTADDR1/PLAI[13]	I/O	Digital I/O Port 3.1 (P3.1). MDIO Port Address Bit 1 (PRTADDR1). See the digital inputs parameter in Table 1 for details. Input to PLA Element 13 (PLAI[13]).
D3	P3.2/PRTADDR2/PLAI[14]	I/O	Digital I/O Port 3.2 (P3.2). MDIO Port Address Bit 2 (PRTADDR2). See the digital inputs parameter in Table 1 for details. Input to PLA Element 14 (PLAI[14]).
B3	P3.3/PRTADDR3/PLAI[15]	I/O	Digital I/O Port 3.3 (P3.3). MDIO Port Address Bit 3 (PRTADDR3). See the digital inputs parameter in Table 1 for details. Output of PLA Element 15 (PLAI[15]).
C11	P3.4/PRTADDR4/PLAO[26]	I/O	Digital I/O Port 3.4 (P3.4). MDIO Port Address Bit 4 (PRTADDR4). See the digital inputs parameter in Table 1 for details. Output of PLA Element 26 (PLAO[26]).
H1	P3.5/MCK/PLAO[27]	I/O	Digital I/O Port 3.5 (P3.5). MDIO Clock (MCK) See the digital inputs parameter in Table 1 for more details. Output of PLA Element 27 (PLAO[27]).
H3	MDIO	I/O	MDIO Data.
E9	SWCLK	I	Serial Wire Debug Clock.
E10	SWDIO	I/O	Serial Wire Bidirectional Data.
F11	VREF_1V2	S	1.2 V Reference. This pin cannot be used to source current externally. Connect VREF_1V2 to AGNDx via a 470 nF capacitor.
A11	IREF	AI	IDAC Reference Current. This pin generates the reference current for the IDACs and is set by an external resistor, R _{EXT} . Connect R _{EXT} from IREF to AGND4.
J6	AIN0	AI	Analog Input 0.
J7	AIN1	AI	Analog Input 1.
J8	AIN2	AI	Analog Input 2.
K8	AIN3	AI	Analog Input 3.
L8	AIN4	AI	Analog Input 4.
L9	AIN5	AI	Analog Input 5. AIN5 can be the –ve input for the comparator.
K9	AIN6	AI	Analog Input 6. AIN6 is also the +ve input for the comparator.
J9	AIN7	AI	Analog Input 7.
L10	AIN8/P4.2	AI/I/O	Analog Input 8 (AIN8). Digital I/O Port 4.2 (P4.2).
K10	AIN9/P4.3	AI/I/O	Analog Input 9 (AIN9). Digital I/O Port 4.3 (P4.3).
J10	AIN10	AI	Analog Input 10.

RECOMMENDED CIRCUIT AND COMPONENT VALUES

Figure 15 shows a typical connection diagram for the [ADuCM320](#).

Supplies and regulators must be adequately decoupled with capacitors connected between the AVDDx, PVDDx, DVDD_x, AVDD_REGx, IOVDDx, and VDD1 balls and their associated GND balls (AGNDx, PGND, IOGNDx, and DGNDx). Table 11 indicates which ground balls are paired with which supply balls.

There are four digital supply balls, IOVDD1, IOVDD2, IOVDD3, and VDD1. Decouple these balls with a 100 nF capacitor placed as near as possible to each of the four balls and their associated GND balls (IOGNDx and AGND1, respectively). In addition, place a 10 μ F capacitor conveniently near to these balls.

Similarly, the analog supply pins, AVDD3 and AVDD4, each require a 100 nF capacitor placed as near as possible to each ball and its associated AGNDx ball, and place a 10 μ F capacitor conveniently near to these balls.

The IDACs source their output currents from the PVDDx supply balls. Each PVDDx supply ball must have a 100 nF capacitor near to each ball and their associated GND balls (PGND). In addition, place at least one 10 μ F capacitor at the source of the PVDDx supply.

The IDAC output filters depend on a 10 nF capacitor being placed between the CDAMPx and PVDDx.

The ADC reference requires a 4.7 μ F capacitor placed between ADC_REFP and ADC_REFN and located as near as possible to each ball. ADC_REFN must be connected directly to AGND4.

The [ADuCM320](#) contains four internal regulators. These regulators require external decoupling capacitors. The DVDD_1V8 and DVDD_2V5 balls each require a 470 nF capacitor to DGND1 and IOGND3, respectively. AVDD_REG0 and AVDD_REG1 each require a decoupling capacitor to AGND4.

To generate an accurate and low drift reference current, connect the IREF ball to AGND4 via a low ppm 3.16 k Ω resistor.

Take care in the layout to ensure that currents flowing from the ground end of each decoupling capacitor to its associated ground ball share as little track as possible with other ground currents on the printed circuit board.
