Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

The system application, Level 3, is the larger user application that utilizes one or more applets. Designing at the highest level of abstraction supported by the Fusion technology stack, the application can be easily created in FPGA gates by importing and configuring multiple applets.

In fact, in some cases an entire FPGA system design can be created without any HDL coding.

An optional MCU enables a combination of software and HDL-based design methodologies. The MCU can be on-chip or off-chip as system requirements dictate. System portioning is very flexible, allowing the MCU to reside above the applets or to absorb applets, or applets and backbone, if desired.

The Fusion technology stack enables a very flexible design environment. Users can engage in design across a continuum of abstraction from very low to very high.

Core Architecture

VersaTile

Based upon successful ProASIC3/E logic architecture, Fusion devices provide granularity comparable to gate arrays. The Fusion device core consists of a sea-of-VersaTiles architecture.

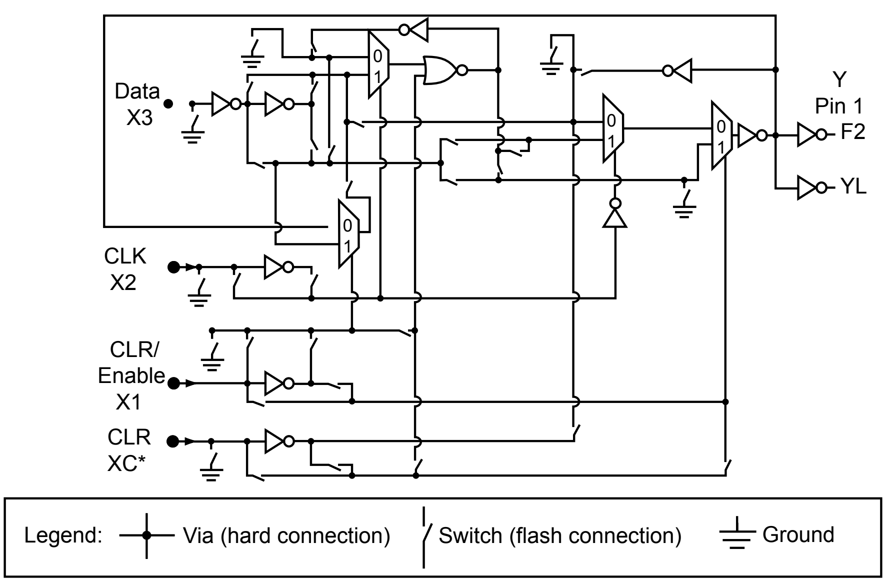
As illustrated in Figure 2-2, there are four inputs in a logic VersaTile cell, and each VersaTile can be configured using the appropriate flash switch connections:

- Any 3-input logic function
- Latch with clear or set
- D-flip-flop with clear or set
- Enable D-flip-flop with clear or set (on a 4th input)

VersaTiles can flexibly map the logic and sequential gates of a design. The inputs of the VersaTile can be inverted (allowing bubble pushing), and the output of the tile can connect to high-speed, very-long-line routing resources. VersaTiles and larger functions are connected with any of the four levels of routing hierarchy.

When the VersaTile is used as an enable D-flip-flop, the SET/CLR signal is supported by a fourth input, which can only be routed to the core cell over the VersaNet (global) network.

The output of the VersaTile is F2 when the connection is to the ultra-fast local lines, or YL when the connection is to the efficient long-line or very-long-line resources (Figure 2-2).



*Note: *This input can only be connected to the global clock distribution network.*

Routing Architecture

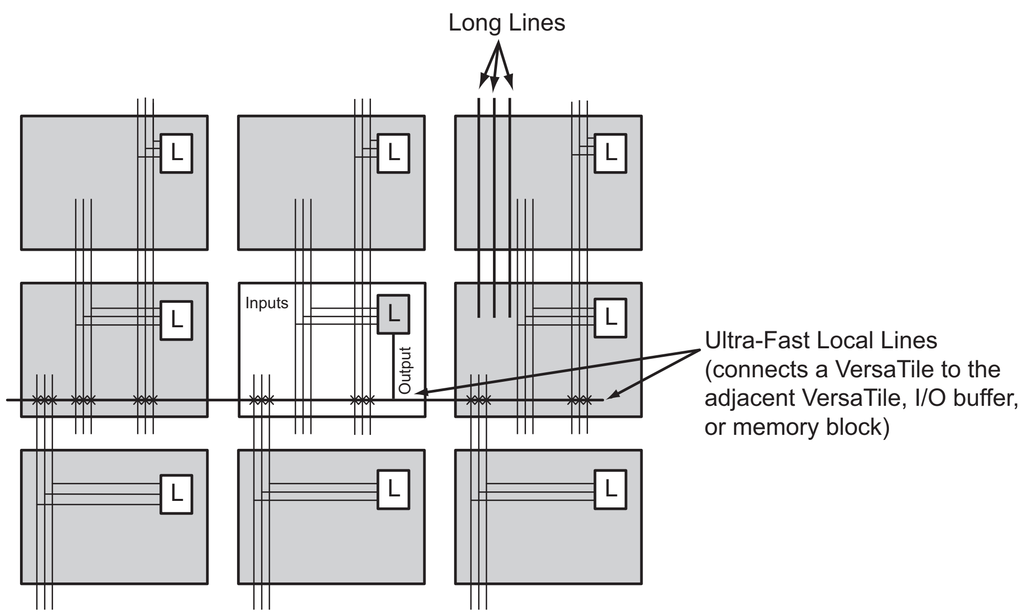
The routing structure of Fusion devices is designed to provide high performance through a flexible four-level hierarchy of routing resources: ultra-fast local resources; efficient long-line resources; high-speed very-long-line resources; and the high-performance VersaNet networks.

The ultra-fast local resources are dedicated lines that allow the output of each VersaTile to connect directly to every input of the eight surrounding VersaTiles (Figure 2-8). The exception to this is that the SET/CLR input of a VersaTile configured as a D-flip-flop is driven only by the VersaNet global network.

The efficient long-line resources provide routing for longer distances and higher-fanout connections. These resources vary in length (spanning one, two, or four VersaTiles), run both vertically and horizontally, and cover the entire Fusion device (Figure 2-9 on page 2-9). Each VersaTile can drive signals onto the efficient long-line resources, which can access every input of every VersaTile. Active buffers are inserted automatically by routing software to limit loading effects.

The high-speed very-long-line resources, which span the entire device with minimal delay, are used to route very long or high-fanout nets: length ±12 VersaTiles in the vertical direction and length ±16 in the horizontal direction from a given core VersaTile (Figure 2-10 on page 2-10). Very long lines in Fusion devices, like those in ProASIC3 devices, have been enhanced. This provides a significant performance boost for long-reach signals.

The high-performance VersaNet global networks are low-skew, high-fanout nets that are accessible from external pins or from internal logic (Figure 2-11 on page 2-11). These nets are typically used to distribute clocks, reset signals, and other high-fanout nets requiring minimum skew. The VersaNet networks are implemented as clock trees, and signals can be introduced at any junction. These can be employed hierarchically, with signals accessing every input on all VersaTiles.



Note: Input to the core cell for the D-flip-flop set and reset is only available via the VersaNet global network connection.

Table 2-16 • **RTC Control/Status Register**

Bit	Name	Description	Default Value
7	rtc_rst	RTC Reset 1 – Resets the RTC 0 – Deassert reset on after two ACM_CLK cycle.	
6	cntr_en	Counter Enable 1 – Enables the counter; rtc_rst must be deasserted as well. First counter increments after 64 RTCCLK positive edges. 0 – Disables the crystal prescaler but does not reset the counter value. Counter value can only be updated when the counter is disabled.	0
5	vr_en_mat	Voltage Regulator Enable on Match 1 – Enables RTCMATCH and RTCPSMMATCH to output 1 when the counter value equals the Match Register value. This enables the 1.5 V voltage regulator when RTCPSMMATCH connects to the RTCPSMMATCH signal in VRPSM. 0 – RTCMATCH and RTCPSMMATCH output 0 at all times.	0
4:3	xt_mode[1:0]	Crystal Mode Controls RTCXTLMODE[1:0]. Connects to RTC_MODE signal in XTLOSC. XTL_MODE uses this value when xtal_en is 1. See the "Crystal Oscillator" section on page 2-20 for mode configuration.	00
2	rst_cnt_omat	Reset Counter on Match 1 – Enables the sync clear of the counter when the counter value equals the Match Register value. The counter clears on the rising edge of the clock. If all the Match Registers are set to 0, the clear is disabled. 0 – Counter increments indefinitely	0
1	rstb_cnt	Counter Reset, active Low 0 - Resets the 40-bit counter value	0
0	xtal_en	Crystal Enable Controls RTCXTLSEL. Connects to SELMODE signal in XTLOSC. 0 – XTLOSC enables control by FPGA_EN; xt_mode is not used. Sleep mode requires this bit to equal 0. 1 – Enables XTLOSC, XTL_MODE control by xt_mode Standby mode requires this bit to be set to 1. See the "Crystal Oscillator" section on page 2-20 for further details on SELMODE configuration.	0

The ADC can be powered down independently of the FPGA core, as an additional control or for power-saving considerations, via the PWRDWN pin of the Analog Block. The PWRDWN pin controls only the comparators in the ADC.

ADC Modes

The Fusion ADC can be configured to operate in 8-, 10-, or 12-bit modes, power-down after conversion, and dynamic calibration. This is controlled by MODE[3:0], as defined in Table 2-41 on page 2-106.

The output of the ADC is the RESULT[11:0] signal. In 8-bit mode, the Most Significant 8 Bits RESULT[11:4] are used as the ADC value and the Least Significant 4 Bits RESULT[3:0] are logical '0's. In 10-bit mode, RESULT[11:2] are used the ADC value and RESULT[1:0] are logical 0s.

Notes:

1. *The device should be operated within the limits specified by the datasheet. During transitions, the input signal may undershoot or overshoot according to the limits shown in Table 3-4 on page 3-4.*
2. *Analog data not valid beyond 3.65 V.*
3. *The high current mode has a maximum power limit of 20 mW. Appropriate current limit resistors must be used, based on voltage on the pad.*
4. *For flash programming and retention maximum limits, refer to Table 3-5 on page 3-5. For recommended operating limits refer to Table 3-2 on page 3-3.*

Methodology

Total Power Consumption—P_{TOTAL}

Operating Mode, Standby Mode, and Sleep Mode

$P_{TOTAL} = P_{STAT} + P_{DYN}$

P_{STAT} is the total static power consumption.

P_{DYN} is the total dynamic power consumption.

Total Static Power Consumption—P_{STAT}

Operating Mode

$P_{STAT} = PDC1 + (N_{NVM\text{-}BLOCKS} * PDC4) + PDC5 + (N_{QUADS} * PDC6) + (N_{INPUTS} * PDC7) + (N_{OUTPUTS} * PDC8) + (N_{PLLS} * PDC9)$

$N_{NVM\text{-}BLOCKS}$ is the number of NVM blocks available in the device.

N_{QUADS} is the number of Analog Quads used in the design.

N_{INPUTS} is the number of I/O input buffers used in the design.

$N_{OUTPUTS}$ is the number of I/O output buffers used in the design.

N_{PLLS} is the number of PLLs available in the device.

Standby Mode

$P_{STAT} = PDC2$

Sleep Mode

$P_{STAT} = PDC3$

Total Dynamic Power Consumption—P_{DYN}

Operating Mode

$P_{DYN} = P_{CLOCK} + P_{S\text{-}CELL} + P_{C\text{-}CELL} + P_{NET} + P_{INPUTS} + P_{OUTPUTS} + P_{MEMORY} + P_{PLL} + P_{NVM} + P_{XTL\text{-}OSC} + P_{RC\text{-}OSC} + P_{AB}$

Standby Mode

$P_{DYN} = P_{XTL\text{-}OSC}$

Sleep Mode

$P_{DYN} = 0\ W$

Global Clock Dynamic Contribution—P_{CLOCK}

Operating Mode

$P_{CLOCK} = (PAC1 + N_{SPINE} * PAC2 + N_{ROW} * PAC3 + N_{S\text{-}CELL} * PAC4) * F_{CLK}$

N_{SPINE} is the number of global spines used in the user design—guidelines are provided in the "Spine Architecture" section of the Global Resources chapter in the *Fusion and Extended Temperature Fusion FPGA Fabric User's Guide*.

N_{ROW} is the number of VersaTile rows used in the design—guidelines are provided in the "Spine Architecture" section of the Global Resources chapter in the *Fusion and Extended Temperature Fusion FPGA Fabric User's Guide*.

F_{CLK} is the global clock signal frequency.

$N_{S\text{-}CELL}$ is the number of VersaTiles used as sequential modules in the design.

Standby Mode and Sleep Mode

$P_{CLOCK} = 0\ W$

Sequential Cells Dynamic Contribution—$P_{S\text{-}CELL}$

Revision	Changes	Page
Revision 3 (continued)	The "RC Oscillator" section was revised to correct a sentence that did not differentiate accuracy for commercial and industrial temperature ranges, which is given in Table 2-9 • Electrical Characteristics of RC Oscillator (SAR 33722).	2-19
	Figure 2-57 • FIFO Read and Figure 2-58 • FIFO Write are new (SAR 34840).	2-72
	The first paragraph of the "Offset" section was removed; it was intended to be replaced by the paragraph following it (SAR 22647).	2-95
	IOL and IOH values for 3.3 V GTL+ and 2.5 V GTL+ were corrected in Table 2-86 • Summary of Maximum and Minimum DC Input and Output Levels Applicable to Commercial and Industrial Conditions (SAR 39813).	2-164
	The drive strength, IOL, and IOH for 3.3 V GTL and 2.5 V GTL were changed from 25 mA to 20 mA in the following tables (SAR 37373): Table 2-86 • Summary of Maximum and Minimum DC Input and Output Levels Applicable to Commercial and Industrial Conditions, Table 2-92 • Summary of I/O Timing Characteristics – Software Default Settings Table 2-96 • I/O Output Buffer Maximum Resistances 1 Table 2-138 • Minimum and Maximum DC Input and Output Levels Table 2-141 • Minimum and Maximum DC Input and Output Levels	 2-164 2-167 2-169 2-199 2-200
	The following sentence was deleted from the "2.5 V LVCMOS" section (SAR 34800): "It uses a 5 V–tolerant input buffer and push-pull output buffer."	2-181
	Corrected the inadvertent error in maximum values for LVPECL VIH and VIL and revised them to "3.6" in Table 2-171 • Minimum and Maximum DC Input and Output Levels, making these consistent with Table 3-1 • Absolute Maximum Ratings, and Table 3-4 • Overshoot and Undershoot Limits 1 (SAR 37687).	2-211
	The maximum frequency for global clock parameter was removed from Table 2-5 • AFS1500 Global Resource Timing through Table 2-8 • AFS090 Global Resource Timing because a frequency on the global is only an indication of what the global network can do. There are other limiters such as the SRAM, I/Os, and PLL. SmartTime software should be used to determine the design frequency (SAR 36955).	2-16 to 2-17
Revision 2 (March 2012)	The phrase "without debug" was removed from the "Soft ARM Cortex-M1 Fusion Devices (M1)" section (SAR 21390).	I
	The "In-System Programming (ISP) and Security" section, "Security" section, "Flash Advantages" section, and "Security" section were revised to clarify that although no existing security measures can give an absolute guarantee, Microsemi FPGAs implement the best security available in the industry (SAR 34679).	I, 1-2, 2-228
	The Y security option and Licensed DPA Logo was added to the "Product Ordering Codes" section. The trademarked Licensed DPA Logo identifies that a product is covered by a DPA counter-measures license from Cryptography Research (SAR 34721).	III
	The "Specifying I/O States During Programming" section is new (SAR 34693).	1-9
	The following information was added before Figure 2-17 • XTLOSC Macro: In the case where the Crystal Oscillator block is not used, the XTAL1 pin should be connected to GND and the XTAL2 pin should be left floating (SAR 24119).	2-20
	Table 2-12 • Fusion CCC/PLL Specification was updated. A note was added indicating that when the CCC/PLL core is generated by Microsemi core generator software, not all delay values of the specified delay increments are available (SAR 34814).	2-28

Revision	Changes	Page
Advance v1.0 (continued)	This change table states that in the "208-Pin PQFP" table listed under the Advance v0.8 changes, the AFS090 device had a pin change. That is incorrect. Pin 102 was updated for AFS250 and AFS600. The function name changed from $V_{CC33ACAP}$ to V_{CC33A}.	3-8
Advance v0.9 (October 2007)	In the "Package I/Os: Single-/Double-Ended (Analog)" table, the AFS1500/M7AFS1500 I/O counts were updated for the following devices: FG484: 223/109 FG676: 252/126	II
	In the "108-Pin QFN" table, the function changed from $V_{CC33ACAP}$ to V_{CC33A} for the following pin: B25	3-2
	In the "180-Pin QFN" table, the function changed from $V_{CC33ACAP}$ to V_{CC33A} for the following pins: AFS090: B29 AFS250: B29	3-4
	In the "208-Pin PQFP" table, the function changed from $V_{CC33ACAP}$ to V_{CC33A} for the following pins: AFS090: 102 AFS250: 102	3-8
	In the "256-Pin FBGA" table, the function changed from $V_{CC33ACAP}$ to V_{CC33A} for the following pins: AFS090: T14 AFS250: T14 AFS600: T14 AFS1500: T14	3-12
Advance v0.9 (continued)	In the "484-Pin FBGA" table, the function changed from $V_{CC33ACAP}$ to V_{CC33A} for the following pins: AFS600: AB18 AFS1500: AB18	3-20
	In the "676-Pin FBGA" table, the function changed from $V_{CC33ACAP}$ to V_{CC33A} for the following pins: AFS1500: AD20	3-28
Advance v0.8 (June 2007)	Figure 2-16 • Fusion Clocking Options and the "RC Oscillator" section were updated to change GND_OSC and VCC_OSC to GNDOSC and VCCOSC.	2-20, 2-21
	Figure 2-19 • Fusion CCC Options: Global Buffers with the PLL Macro was updated to change the positions of OADIVRST and OADIVHALF, and a note was added.	2-25
	The "Crystal Oscillator" section was updated to include information about controlling and enabling/disabling the crystal oscillator.	2-22
	Table 2-11 · Electrical Characteristics of the Crystal Oscillator was updated to change the typical value of $I_{DYNXTAL}$ for 0.032–0.2 MHz to 0.19.	2-24
	The "1.5 V Voltage Regulator" section was updated to add "or floating" in the paragraph stating that an external pull-down is required on TRST to power down the VR.	2-41
	The "1.5 V Voltage Regulator" section was updated to include information on powering down with the VR.	2-41
