

Welcome to [E-XFL.COM](https://www.e-xfl.com)

### Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

#### Details

Product Status	Active
Number of LABs/CLBs	-
Number of Logic Elements/Cells	-
Total RAM Bits	276480
Number of I/O	252
Number of Gates	1500000
Voltage - Supply	1.425V ~ 1.575V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	676-BGA
Supplier Device Package	676-FBGA (27x27)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/microchip-technology/afs1500-1fg676">https://www.e-xfl.com/product-detail/microchip-technology/afs1500-1fg676</a>

### Unprotect Page Operation

An Unprotect Page operation will clear the protection for a page addressed on the ADDR input. It is initiated by setting the UNPROTECTPAGE signal on the interface along with the page address on ADDR.

If the page is not in the Page Buffer, the Unprotect Page operation will copy the page into the Page Buffer. The Copy Page operation occurs only if the current page in the Page Buffer is not Page Loss Protected.

The waveform for an Unprotect Page operation is shown in Figure 2-42.

**Figure 2-42 • FB Unprotected Page Waveform**

The Unprotect Page operation can incur the following error conditions:

1. If the copy of the page to the Page Buffer determines that the page has a single-bit correctable error in the data, it will report a STATUS = '01'.
2. If the address on ADDR does not match the address of the Page Buffer, PAGELOSSPROTECT is asserted, and the Page Buffer has been modified, then STATUS = '11' and the addressed page is not loaded into the Page Buffer.
3. If the copy of the page to the Page Buffer determines that at least one block in the page has a double-bit uncorrectable error, STATUS = '10' and the Page Buffer will contain the corrupted data.

### Discard Page Operation

If the contents of the modified Page Buffer have to be discarded, the DISCARDPAGE signal should be asserted. This command results in the Page Buffer being marked as unmodified.

The timing for the operation is shown in Figure 2-43. The BUSY signal will remain asserted until the operation has completed.

**Figure 2-43 • FB Discard Page Waveform**

### ***DINA and DINB***

These are the input data signals, and they are nine bits wide. Not all nine bits are valid in all configurations. When a data width less than nine is specified, unused high-order signals must be grounded ([Table 2-29](#)).

### ***DOUTA and DOUTB***

These are the nine-bit output data signals. Not all nine bits are valid in all configurations. As with DINA and DINB, high-order bits may not be used ([Table 2-29](#)). The output data on unused pins is undefined.

**Table 2-29 • Unused/Used Input and Output Data Pins for Various Supported Bus Widths**

<b>D×W</b>	<b>DINx/DOUTx</b>	
	<b>Unused</b>	<b>Used</b>
4k×1	[8:1]	[0]
2k×2	[8:2]	[1:0]
1k×4	[8:4]	[3:0]
512×9	None	[8:0]

*Note:* The "x" in DINx and DOUTx implies A or B.

There are several popular ADC architectures, each with advantages and limitations.

The analog-to-digital converter in Fusion devices is a switched-capacitor Successive Approximation Register (SAR) ADC. It supports 8-, 10-, and 12-bit modes of operation with a cumulative sample rate up to 600 k samples per second (ksps). Built-in bandgap circuitry offers 1% internal voltage reference accuracy or an external reference voltage can be used.

As shown in [Figure 2-81](#), a SAR ADC contains N capacitors with binary-weighted values.

**Figure 2-81 • Example SAR ADC Architecture**

To begin a conversion, all of the capacitors are quickly discharged. Then VIN is applied to all the capacitors for a period of time (acquisition time) during which the capacitors are charged to a value very close to VIN. Then all of the capacitors are switched to ground, and thus  $-VIN$  is applied across the comparator. Now the conversion process begins. First, C is switched to VREF. Because of the binary weighting of the capacitors, the voltage at the input of the comparator is then shown by [EQ 11](#).

$$\text{Voltage at input of comparator} = -VIN + VREF / 2$$

*EQ 11*

If VIN is greater than  $VREF / 2$ , the output of the comparator is 1; otherwise, the comparator output is 0. A register is clocked to retain this value as the MSB of the result. Next, if the MSB is 0, C is switched back to ground; otherwise, it remains connected to VREF, and C / 2 is connected to VREF. The result at the comparator input is now either  $-VIN + VREF / 4$  or  $-VIN + 3 VREF / 4$  (depending on the state of the MSB), and the comparator output now indicates the value of the next most significant bit. This bit is likewise registered, and the process continues for each subsequent bit until a conversion is completed. The conversion process requires some acquisition time plus N + 1 ADC clock cycles to complete.

## ADC Terminology

### Conversion Time

Conversion time is the interval between the release of the hold state (imposed by the input circuitry of a track-and-hold) and the instant at which the voltage on the sampling capacitor settles to within one LSB of a new input value.

### DNL – Differential Non-Linearity

For an ideal ADC, the analog-input levels that trigger any two successive output codes should differ by one LSB (DNL = 0). Any deviation from one LSB is defined as DNL (Figure 2-83).

**Figure 2-83 • Differential Non-Linearity (DNL)**

### ENOB – Effective Number of Bits

ENOB specifies the dynamic performance of an ADC at a specific input frequency and sampling rate. An ideal ADC's error consists only of quantization of noise. As the input frequency increases, the overall noise (particularly in the distortion components) also increases, thereby reducing the ENOB and SINAD (also see "Signal-to-Noise and Distortion Ratio (SINAD)"). ENOB for a full-scale, sinusoidal input waveform is computed using EQ 12.

$$ENOB = \frac{SINAD - 1.76}{6.02}$$

EQ 12

### FS Error – Full-Scale Error

Full-scale error is the difference between the actual value that triggers that transition to full-scale and the ideal analog full-scale transition value. Full-scale error equals offset error plus gain error.

### Integrated Voltage Reference

The Fusion device has an integrated on-chip 2.56 V reference voltage for the ADC. The value of this reference voltage was chosen to make the prescaling and postscaling factors for the prescaler blocks change in a binary fashion. However, if desired, an external reference voltage of up to 3.3 V can be connected between the VAREF and ADCGNDREF pins. The VAREFSEL control pin is used to select the reference voltage.

**Table 2-42 • VAREF Bit Function**

Name	Bit	Function
VAREF	0	Reference voltage selection 0 – Internal voltage reference selected. VAREF pin outputs 2.56 V. 1 – Input external voltage reference from VAREF and ADCGNDREF

### ADC Clock

The speed of the ADC depends on its internal clock, ADCCLK, which is not accessible to users. The ADCCLK is derived from SYSCLK. Input signal TVC[7:0], Time Divider Control, determines the speed of the ADCCLK in relationship to SYSCLK, based on [EQ 15](#).

$$t_{\text{ADCCLK}} = 4 \times (1 + \text{TVC}) \times t_{\text{SYSCLK}}$$

*EQ 15*

TVC: Time Divider Control (0–255)

$t_{\text{ADCCLK}}$  is the period of ADCCLK, and must be between 0.5 MHz and 10 MHz

$t_{\text{SYSCLK}}$  is the period of SYSCLK

**Table 2-43 • TVC Bits Function**

Name	Bits	Function
TVC	[7:0]	SYSCLK divider control

The frequency of ADCCLK,  $f_{\text{ADCCLK}}$ , must be within 0.5 Hz to 10 MHz.

The inputs to the ADC are synchronized to SYSCLK. A conversion is initiated by asserting the ADCSTART signal on a rising edge of SYSCLK. [Figure 2-90 on page 2-112](#) and [Figure 2-91 on page 2-112](#) show the timing diagram for the ADC.

### Acquisition Time or Sample Time Control

Acquisition time ( $t_{\text{SAMPLE}}$ ) specifies how long an analog input signal has to charge the internal capacitor array. [Figure 2-88](#) shows a simplified internal input sampling mechanism of a SAR ADC.

**Figure 2-88 • Simplified Sample and Hold Circuitry**

The internal impedance ( $Z_{\text{INAD}}$ ), external source resistance ( $R_{\text{SOURCE}}$ ), and sample capacitor ( $C_{\text{INAD}}$ ) form a simple RC network. As a result, the accuracy of the ADC can be affected if the ADC is given insufficient time to charge the capacitor. To resolve this problem, you can either reduce the source resistance or increase the sampling time by changing the acquisition time using the STC signal.

**Table 2-73 • Maximum I/O Frequency for Single-Ended, Voltage-Referenced, and Differential I/Os;  
All I/O Bank Types (maximum drive strength and high slew selected)**

Specification	Performance Up To
LVTTL/LVCMOS 3.3 V	200 MHz
LVCMOS 2.5 V	250 MHz
LVCMOS 1.8 V	200 MHz
LVCMOS 1.5 V	130 MHz
PCI	200 MHz
PCI-X	200 MHz
HSTL-I	300 MHz
HSTL-II	300 MHz
SSTL2-I	300 MHz
SSTL2-II	300 MHz
SSTL3-I	300 MHz
SSTL3-II	300 MHz
GTL+ 3.3 V	300 MHz
GTL+ 2.5 V	300 MHz
GTL 3.3 V	300 MHz
GTL 2.5 V	300 MHz
LVDS	350 MHz
LVPECL	300 MHz

### 1.8 V LVCMOS

Low-Voltage CMOS for 1.8 V is an extension of the LVCMOS standard (JESD8-5) used for general-purpose 1.8 V applications. It uses a 1.8 V input buffer and push-pull output buffer.

**Table 2-118 • Minimum and Maximum DC Input and Output Levels**

**Notes:**

1. IIL is the input leakage current per I/O pin over recommended operation conditions where  $-0.3\text{ V} < V_{IN} < V_{IL}$ .
2. IIH is the input leakage current per I/O pin over recommended operating conditions  $V_{IH} < V_{IN} < V_{CCI}$ . Input current is larger when operating outside recommended ranges.
3. Currents are measured at high temperature (100°C junction temperature) and maximum voltage.
4. Currents are measured at 85°C junction temperature.
5. Software default selection highlighted in gray.

**Figure 2-121 • AC Loading**

**Table 2-119 • AC Waveforms, Measuring Points, and Capacitive Loads**

Input Low (V)	Input Low (V)	Measuring Point* (V)	VREF (typ.) (V)	C <sub>LOAD</sub> (pF)

## **XTAL2                      Crystal Oscillator Circuit Input**

Input to crystal oscillator circuit. Pin for connecting external crystal, ceramic resonator, RC network, or external clock input. When using an external crystal or ceramic oscillator, external capacitors are also recommended (Please refer to the crystal oscillator manufacturer for proper capacitor value).

If using external RC network or clock input, XTAL1 should be used and XTAL2 left unconnected. In the case where the Crystal Oscillator block is not used, the XTAL1 pin should be connected to GND and the XTAL2 pin should be left floating.

# **Security**

Fusion devices have a built-in 128-bit AES decryption core. The decryption core facilitates highly secure, in-system programming of the FPGA core array fabric and the FlashROM. The FlashROM and the FPGA core fabric can be programmed independently from each other, allowing the FlashROM to be updated without the need for change to the FPGA core fabric. The AES master key is stored in on-chip nonvolatile memory (flash). The AES master key can be preloaded into parts in a security-protected programming environment (such as the Microsemi in-house programming center), and then "blank" parts can be shipped to an untrusted programming or manufacturing center for final personalization with an AES-encrypted bitstream. Late stage product changes or personalization can be implemented easily and with high level security by simply sending a STAPL file with AES-encrypted data. Highly secure remote field updates over public networks (such as the Internet) are possible by sending and programming a STAPL file with AES-encrypted data. For more information, refer to the [Fusion Security](#) application note.

## **128-Bit AES Decryption**

The 128-bit AES standard (FIPS-197) block cipher is the National Institute of Standards and Technology (NIST) replacement for DES (Data Encryption Standard FIPS46-2). AES has been designed to protect sensitive government information well into the 21st century. It replaces the aging DES, which NIST adopted in 1977 as a Federal Information Processing Standard used by federal agencies to protect sensitive, unclassified information. The 128-bit AES standard has  $3.4 \times 10^{38}$  possible 128-bit key variants, and it has been estimated that it would take 1,000 trillion years to crack 128-bit AES cipher text using exhaustive techniques. Keys are stored (protected with security) in Fusion devices in nonvolatile flash memory. All programming files sent to the device can be authenticated by the part prior to programming to ensure that bad programming data is not loaded into the part that may possibly damage it. All programming verification is performed on-chip, ensuring that the contents of Fusion devices remain as secure as possible.

AES decryption can also be used on the 1,024-bit FlashROM to allow for remote updates of the FlashROM contents. This allows for easy support of subscription model products and protects them with measures designed to provide the highest level of security available. See the application note [Fusion Security](#) for more details.

## **AES for Flash Memory**

AES decryption can also be used on the flash memory blocks. This provides the best available security during update of the flash memory blocks. During runtime, the encrypted data can be clocked in via the JTAG interface. The data can be passed through the internal AES decryption engine, and the decrypted data can then be stored in the flash memory block.

# **Programming**

Programming can be performed using various programming tools, such as Silicon Sculptor II (BP Micro Systems) or FlashPro3 (Microsemi).

The user can generate STP programming files from the Designer software and can use these files to program a device.

Fusion devices can be programmed in-system. During programming, VCCOSC is needed in order to power the internal 100 MHz oscillator. This oscillator is used as a source for the 20 MHz oscillator that is used to drive the charge pump for programming.

**Table 3-8 • AFS1500 Quiescent Supply Current Characteristics (continued)**

Parameter	Description	Conditions	Temp.	Min.	Typ.	Max.	Unit
IJTAG	JTAG I/O quiescent current	Operational standby <sup>4</sup> , VJTAG = 3.63 V	T <sub>J</sub> = 25°C		80	100	μA
			T <sub>J</sub> = 85°C		80	100	μA
			T <sub>J</sub> = 100°C		80	100	μA
		Standby mode <sup>5</sup> or Sleep mode <sup>6</sup> , VJTAG = 0 V			0	0	μA

			T <sub>J</sub> = 85°C		130	200	μA
			T <sub>J</sub> = 100°C		130	200	μA

**Notes:**

1. ICC is the 1.5 V power supplies, ICC and ICC15A.
2. ICC33A includes ICC33A, ICC33PMP, and ICCOSC.
3. ICCI includes all ICCI0, ICCI1, ICCI2, and ICCI4.
4. Operational standby is when the Fusion device is powered up, all blocks are used, no I/O is toggling, Voltage Regulator is loaded with 200 mA, VCC33PMP is ON, XTAL is ON, and ADC is ON.
5. XTAL is configured as high gain, VCC = VJTAG = VPUMP = 0 V.
6. Sleep Mode, VCC = VJTAG = VPUMP = 0 V.

**Table 3-9 • AFS600 Quiescent Supply Current Characteristics**

Parameter	Description	Conditions	Temp.	Min	Typ	Max	Unit
ICC <sup>1</sup>	1.5 V quiescent current	Operational standby <sup>4</sup> , VCC = 1.575 V	T <sub>J</sub> = 25°C		13	25	mA
			T <sub>J</sub> = 85°C		20	45	mA
			T <sub>J</sub> = 100°C		25	75	mA
		Standby mode <sup>5</sup> or Sleep mode <sup>6</sup> , VCC = 0 V			0	0	μA
ICC33 <sup>2</sup>	3.3 V analog supplies current	Operational standby <sup>4</sup> , VCC33 = 3.63 V	T <sub>J</sub> = 25°C		9.8	13	mA
			T <sub>J</sub> = 85°C		10.7	14	mA
			T <sub>J</sub> = 100°C		10.8	15	mA
		Operational standby, only Analog Quad and –3.3 V output ON, VCC33 = 3.63 V	T <sub>J</sub> = 25°C		0.31	2	mA
			T <sub>J</sub> = 85°C		0.35	2	mA
			T <sub>J</sub> = 100°C		0.45	2	mA
		Standby mode <sup>5</sup> , VCC33 = 3.63 V	T <sub>J</sub> = 25°C		2.8	3.6	mA
			T <sub>J</sub> = 85°C		2.9	4	mA
			T <sub>J</sub> = 100°C		3.5	6	mA
		Sleep mode <sup>6</sup> , VCC33 = 3.63 V	T <sub>J</sub> = 25°C		17	19	μA
			T <sub>J</sub> = 85°C		18	20	μA
			T <sub>J</sub> = 100°C		24	25	μA
ICCI <sup>3</sup>	I/O quiescent current	Operational standby <sup>4</sup> , VCCIX = 3.63 V	T <sub>J</sub> = 25°C		417	648	μA
			T <sub>J</sub> = 85°C		417	648	μA
			T <sub>J</sub> = 100°C		417	649	μA
IJTAG	JTAG I/O quiescent current	Operational standby <sup>4</sup> , VJTAG = 3.63 V	T <sub>J</sub> = 25°C		80	100	μA
			T <sub>J</sub> = 85°C		80	100	μA
			T <sub>J</sub> = 100°C		80	100	μA
		Standby mode <sup>5</sup> or Sleep mode <sup>6</sup> , VJTAG = 0 V			0	0	μA

**Notes:**

1. ICC is the 1.5 V power supplies, ICC and ICC15A.
2. ICC33A includes ICC33A, ICC33PMP, and ICCOSC.
3. ICCI includes all ICCI0, ICCI1, ICCI2, and ICCI4.
4. Operational standby is when the Fusion device is powered up, all blocks are used, no I/O is toggling, Voltage Regulator is loaded with 200 mA, VCC33PMP is ON, XTAL is ON, and ADC is ON.
5. XTAL is configured as high gain, VCC = VJTAG = VPUMP = 0 V.
6. Sleep Mode, VCC = VJTAG = VPUMP = 0 V.

**Table 3-11 • AFS090 Quiescent Supply Current Characteristics (continued)**

Parameter	Description	Conditions	Temp.	Min	Typ	Max	Unit
ICCNVM	Embedded NVM current	Reset asserted, VCCNVM = 1.575 V	T <sub>J</sub> = 25°C		10	40	μA
			T <sub>J</sub> = 85°C		14	40	μA
			T <sub>J</sub> = 100°C		14	40	μA
ICCPLL	1.5 V PLL quiescent current	Operational standby, VCCPLL = 1.575 V	T <sub>J</sub> = 25°C		65	100	μA
			T <sub>J</sub> = 85°C		65	100	μA
			T <sub>J</sub> = 100°C		65	100	μA

**Notes:**

1. ICC is the 1.5 V power supplies, ICC, ICCPLL, ICC15A, ICCNVM.
2. ICC33A includes ICC33A, ICC33PMP, and ICCOSC.
3. ICCI includes all ICCI0, ICCI1, and ICCI2.
4. Operational standby is when the Fusion device is powered up, all blocks are used, no I/O is toggling, Voltage Regulator is loaded with 200 mA, VCC33PMP is ON, XTAL is ON, and ADC is ON.
5. XTAL is configured as high gain, VCC = VJTAG = VPUMP = 0 V.
6. Sleep Mode, VCC = VJTAG = VPUMP = 0 V.

**Table 3-13 • Summary of I/O Output Buffer Power (per pin)—Default I/O Software Settings<sup>1</sup>**

	C <sub>LOAD</sub> (pF)	V <sub>CCI</sub> (V)	Static Power PDC8 (mW) <sup>2</sup>	Dynamic Power PAC10 (μW/MHz) <sup>3</sup>
<b>Applicable to Pro I/O Banks</b>				
<b>Single-Ended</b>				
3.3 V LVTTTL/LVCMOS	35	3.3	—	474.70
2.5 V LVCMOS	35	2.5	—	270.73
1.8 V LVCMOS	35	1.8	—	151.78
1.5 V LVCMOS (JESD8-11)	35	1.5	—	104.55
3.3 V PCI	10	3.3	—	204.61
3.3 V PCI-X	10	3.3	—	204.61
<b>Voltage-Referenced</b>				
3.3 V GTL	10	3.3	—	24.08
2.5 V GTL	10	2.5	—	13.52
3.3 V GTL+	10	3.3	—	24.10
2.5 V GTL+	10	2.5	—	13.54
HSTL (I)	20	1.5	7.08	26.22
HSTL (II)	20	1.5	13.88	27.22
SSTL2 (I)	30	2.5	16.69	105.56
SSTL2 (II)	30	2.5	25.91	116.60
SSTL3 (I)	30	3.3	26.02	114.87
SSTL3 (II)	30	3.3	42.21	131.76
<b>Differential</b>				
LVDS	—	2.5	7.70	89.62
LVPECL	—	3.3	19.42	168.02
<b>Applicable to Advanced I/O Banks</b>				
<b>Single-Ended</b>				
3.3 V LVTTTL / 3.3 V LVCMOS	35	3.3	—	468.67
2.5 V LVCMOS	35	2.5	—	267.48
1.8 V LVCMOS	35	1.8	—	149.46
1.5 V LVCMOS (JESD8-11)	35	1.5	—	103.12
3.3 V PCI	10	3.3	—	201.02
3.3 V PCI-X	10	3.3	—	201.02

**Notes:**

1. Dynamic power consumption is given for standard load and software-default drive strength and output slew.
2. PDC8 is the static power (where applicable) measured on V<sub>CCI</sub>.
3. PAC10 is the total dynamic power measured on V<sub>CC</sub> and V<sub>CCI</sub>.

## Datasheet Categories

### **Categories**

In order to provide the latest information to designers, some datasheet parameters are published before data has been fully characterized from silicon devices. The data provided for a given device, as highlighted in the "[Fusion Device Status](#)" table, is designated as either "Product Brief," "Advance," "Preliminary," or "Production." The definitions of these categories are as follows:

#### **Product Brief**

The product brief is a summarized version of a datasheet (advance or production) and contains general product information. This document gives an overview of specific device and family information.

#### **Advance**

This version contains initial estimated information based on simulation, other products, devices, or speed grades. This information can be used as estimates, but not for production. This label only applies to the DC and Switching Characteristics chapter of the datasheet and will only be used when the data has not been fully characterized.

#### **Preliminary**

The datasheet contains information based on simulation and/or initial characterization. The information is believed to be correct, but changes are possible.

#### **Production**

This version contains information that is considered to be final.

### **Export Administration Regulations (EAR)**

The products described in this document are subject to the Export Administration Regulations (EAR). They could require an approved export license prior to export from the United States. An export includes release of product or disclosure of technology to a foreign national inside or outside the United States.

## Safety Critical, Life Support, and High-Reliability Applications Policy

The products described in this advance status document may not have completed the Microsemi qualification process. Products may be amended or enhanced during the product introduction and qualification process, resulting in changes in device functionality or performance. It is the responsibility of each customer to ensure the fitness of any product (but especially a new product) for a particular purpose, including appropriateness for safety-critical, life-support, and other high-reliability applications. Consult the Microsemi SoC Products Group Terms and Conditions for specific liability exclusions relating to life-support applications. A reliability report covering all of the SoC Products Group's products is available at [http://www.microsemi.com/soc/documents/ORT\\_Report.pdf](http://www.microsemi.com/soc/documents/ORT_Report.pdf). Microsemi also offers a variety of enhanced qualification and lot acceptance screening procedures. Contact your local sales office for additional reliability information.
