Microchip Technology - AFS1500-1FGG484 Datasheet

Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Details	
Product Status	Active
Number of LABs/CLBs	-
Number of Logic Elements/Cells	-
Total RAM Bits	276480
Number of I/O	223
Number of Gates	1500000
Voltage - Supply	1.425V ~ 1.575V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	484-BGA
Supplier Device Package	484-FPBGA (23x23)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/afs1500-1fgg484

Cortex-M1, Pigeon Point, and MicroBlade Fusion Device Information

This datasheet provides information for all Fusion (AFS), Cortex-M1 (M1), Pigeon Point (P1), and MicroBlade (U1) devices. The remainder of the document will only list the Fusion (AFS) devices. Please apply relevant information to M1, P1, and U1 devices when appropriate. Please note the following:

- Cortex-M1 devices are offered in the same speed grades and packages as basic Fusion devices.
- Pigeon Point devices are only offered in –2 speed grade and FG484 and FG256 packages.
- MicroBlade devices are only offered in standard speed grade and the FG256 package.

The FlashPoint tool in the Fusion development software solutions, Libero SoC and Designer, has extensive support for flash memory blocks and FlashROM. One such feature is auto-generation of sequential programming files for applications requiring a unique serial number in each part. Another feature allows the inclusion of static data for system version control. Data for the FlashROM can be generated quickly and easily using the Libero SoC and Designer software tools. Comprehensive programming file support is also included to allow for easy programming of large numbers of parts with differing FlashROM contents.

SRAM and FIFO

Fusion devices have embedded SRAM blocks along the north and south sides of the device. Each variable-aspect-ratio SRAM block is 4,608 bits in size. Available memory configurations are 256×18, 512×9, 1k×4, 2k×2, and 4k×1 bits. The individual blocks have independent read and write ports that can be configured with different bit widths on each port. For example, data can be written through a 4-bit port and read as a single bitstream. The SRAM blocks can be initialized from the flash memory blocks or via the device JTAG port (ROM emulation mode), using the UJTAG macro.

In addition, every SRAM block has an embedded FIFO control unit. The control unit allows the SRAM block to be configured as a synchronous FIFO without using additional core VersaTiles. The FIFO width and depth are programmable. The FIFO also features programmable Almost Empty (AEMPTY) and Almost Full (AFULL) flags in addition to the normal EMPTY and FULL flags. The embedded FIFO control unit contains the counters necessary for the generation of the read and write address pointers. The SRAM/FIFO blocks can be cascaded to create larger configurations.

Clock Resources

PLLs and Clock Conditioning Circuits (CCCs)

Fusion devices provide designers with very flexible clock conditioning capabilities. Each member of the Fusion family contains six CCCs. In the two larger family members, two of these CCCs also include a PLL; the smaller devices support one PLL.

The inputs of the CCC blocks are accessible from the FPGA core or from one of several inputs with dedicated CCC block connections.

The CCC block has the following key features:

- Wide input frequency range (f_{IN_CCC}) = 1.5 MHz to 350 MHz
- Output frequency range (f_{OUT_CCC}) = 0.75 MHz to 350 MHz
- Clock phase adjustment via programmable and fixed delays from –6.275 ns to +8.75 ns
- Clock skew minimization (PLL)
- Clock frequency synthesis (PLL)
- On-chip analog clocking resources usable as inputs:
  - 100 MHz on-chip RC oscillator
  - Crystal oscillator

Additional CCC specifications:

- Internal phase shift = 0°, 90°, 180°, and 270°
- Output duty cycle = 50% ± 1.5%
- Low output jitter. Samples of peak-to-peak period jitter when a single global network is used:
  - 70 ps at 350 MHz
  - 90 ps at 100 MHz
  - 180 ps at 24 MHz
  - Worst case < 2.5% × clock period
- Maximum acquisition time = 150 µs
- Low power consumption of 5 mW

Global Resource Characteristics

AFS600 VersaNet Topology

Clock delays are device-specific. Figure 2-15 is an example of a global tree used for clock routing. The global tree presented in Figure 2-15 is driven by a CCC located on the west side of the AFS600 device. It is used to drive all D-flip-flops in the device.

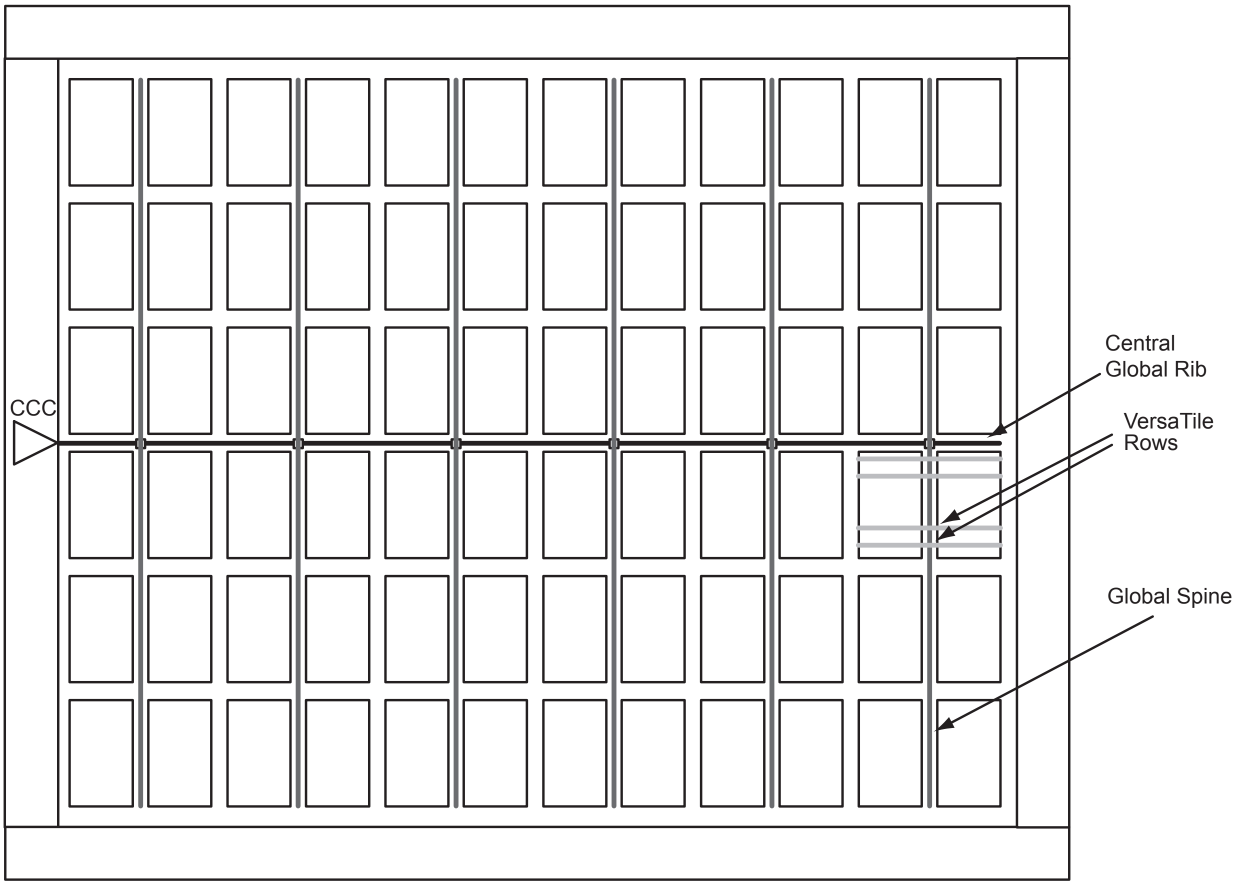

Figure 2-15 • **Example of Global Tree Use in an AFS600 Device for Clock Routing**

1.5 V Voltage Regulator

The 1.5 V voltage regulator uses an external pass transistor to generate 1.5 V from a 3.3 V supply. The base of the pass transistor is tied to PTBASE, the collector is tied to 3.3 V, and an emitter is tied to PTBASE and the 1.5 V supplies of the Fusion device. Figure 2-27 on page 2-31 shows the hook-up of the 1.5 V voltage regulator to an external pass transistor.

Microsemi recommends using a PN2222A or 2N2222A transistor. The gain of such a transistor is approximately 25, with a maximum base current of 20 mA. The maximum current that can be supported is 0.5 A. Transistors with different gain can also be used for different current requirements.

***Table 2-18* • Electrical Characteristics**
VCC33A = 3.3 V

There are several popular ADC architectures, each with advantages and limitations.

The analog-to-digital converter in Fusion devices is a switched-capacitor Successive Approximation Register (SAR) ADC. It supports 8-, 10-, and 12-bit modes of operation with a cumulative sample rate up to 600 k samples per second (ksps). Built-in bandgap circuitry offers 1% internal voltage reference accuracy or an external reference voltage can be used.

As shown in Figure 2-81, a SAR ADC contains N capacitors with binary-weighted values.

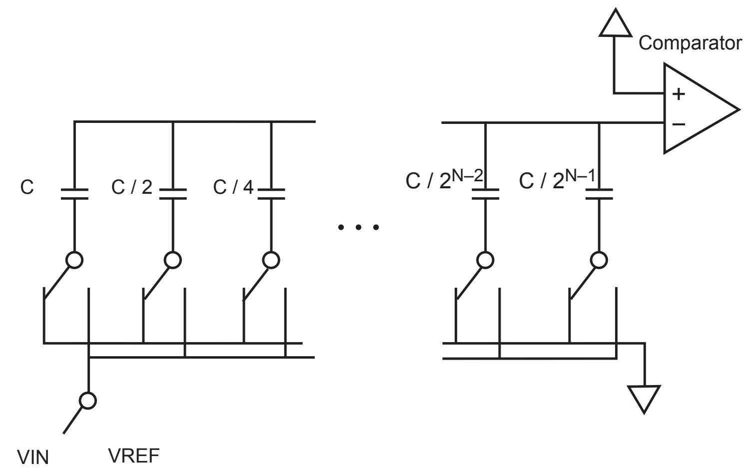

Figure 2-81 **• Example SAR ADC Architecture**

To begin a conversion, all of the capacitors are quickly discharged. Then VIN is applied to all the capacitors for a period of time (acquisition time) during which the capacitors are charged to a value very close to VIN. Then all of the capacitors are switched to ground, and thus –VIN is applied across the comparator. Now the conversion process begins. First, C is switched to VREF. Because of the binary weighting of the capacitors, the voltage at the input of the comparator is then shown by EQ 11.

$$\text{Voltage at input of comparator} = -\text{VIN} + \text{VREF} / 2$$

EQ 11

If VIN is greater than VREF / 2, the output of the comparator is 1; otherwise, the comparator output is 0. A register is clocked to retain this value as the MSB of the result. Next, if the MSB is 0, C is switched back to ground; otherwise, it remains connected to VREF, and C / 2 is connected to VREF. The result at the comparator input is now either –VIN + VREF / 4 or –VIN + 3 VREF / 4 (depending on the state of the MSB), and the comparator output now indicates the value of the next most significant bit. This bit is likewise registered, and the process continues for each subsequent bit until a conversion is completed. The conversion process requires some acquisition time plus N + 1 ADC clock cycles to complete.

***Table 2-49* • Analog Channel Specifications (continued)**
Commercial Temperature Range Conditions, T_J = 85°C (unless noted otherwise),
Typical: VCC33A = 3.3 V, VCC = 1.5 V

Parameter	Description	Condition	Min.	Typ.	Max.	Units

		10-bit ADC	1			°C
		12-bit ADC	0.25			°C
	Systematic Offset[5]	AFS090[7]		5		°C
		AFS250, AFS600, AFS1500[7]		11		°C
	Accuracy			±3	±5	°C
t_{TMSHI}	Strobe High time		10		105	µs
t_{TMSLO}	Strobe Low time		5			µs
t_{TMSSET}	Settling time		5			µs

Notes:

1. *VRSM is the maximum voltage drop across the current sense resistor.*
2. *Analog inputs used as digital inputs can tolerate the same voltage limits as the corresponding analog pad. There is no reliability concern on digital inputs as long as VIND does not exceed these limits.*
3. *VIND is limited to VCC33A + 0.2 to allow reaching 10 MHz input frequency.*
4. *An averaging of 1,024 samples (LPF setting in Analog System Builder) is required and the maximum capacitance allowed across the AT pins is 500 pF.*
5. *The temperature offset is a fixed positive value.*
6. *The high current mode has a maximum power limit of 20 mW. Appropriate current limit resistors must be used, based on voltage on the pad.*
7. *When using SmartGen Analog System Builder, CalibIP is required to obtain specified offset. For further details on CalibIP, refer to the "Temperature, Voltage, and Current Calibration in Fusion FPGAs" chapter of the* Fusion FPGA Fabric User Guide.

Similarly,

Min. Output Voltage = (Max. Negative input offset) + (Input Voltage x Max. Negative Channel Gain)

= (–88 mV) + (5 V x 0.96) = **4.712 V**

Calculating Accuracy for a Calibrated Analog Channel

Formula

For a given prescaler range, EQ 31 gives the output voltage.

Output Voltage = Channel Error in V + Input Voltage

EQ 31

where

Channel Error in V = Total Channel Error in LSBs x Equivalent voltage per LSB

Example

Input Voltage = 5 V

Chosen Prescaler range = 8 V range

Refer to Table 2-52 on page 2-123.

Max. Output Voltage = Max. Positive Channel Error in V + Input Voltage

Max. Positive Channel Error in V = (6 LSB) × (8 mV per LSB in 10-bit mode) = 48 mV

Max. Output Voltage = 48 mV + 5 V = **5.048 V**

Similarly,

Min. Output Voltage = Max. Negative Channel Error in V + Input Voltage = (–48 mV) + 5 V = **4.952 V**

Calculating LSBs from a Given Error Budget

Formula

For a given prescaler range,

LSB count = ± (Input Voltage × Required % error) / (Equivalent voltage per LSB)

Example

Input Voltage = 3.3 V

Required error margin= 1%

Refer to Table 2-52 on page 2-123.

Equivalent voltage per LSB = 16 mV for a 16V prescaler, with ADC in 10-bit mode

LSB Count = ± (5.0 V × 1%) / (0.016)

LSB Count = **± 3.125**

Equivalent voltage per LSB = **8 mV** for an 8 V prescaler, with ADC in 10-bit mode

LSB Count = ± (5.0 V × 1%) / (0.008)

LSB Count = **± 6.25**

The 8 V prescaler satisfies the calculated LSB count accuracy requirement (see Table 2-52 on page 2-123).

2.5 V GTL+

Gunning Transceiver Logic Plus is a high-speed bus standard (JESD8-3). It provides a differential amplifier input buffer and an open-drain output buffer. The VCCI pin should be connected to 2.5 V.

Table 2-147 • Minimum and Maximum DC Input and Output Levels

2.5 V GTL+	VIL		VIH		VOL	VOH	IOL	IOH	IOSL	IOSH	IIL[1]	IIH[2]
Drive Strength	Min. V	Max. V	Min. V	Max. V	Max. V	Min. V	mA	mA	Max. mA[3]	Max. mA[3]	µA[4]	µA[4]
33 mA	–0.3	VREF – 0.1	VREF + 0.1	3.6	0.6	–	33	33	124	169	10	10

Notes:

1. *IIL is the input leakage current per I/O pin over recommended operation conditions where –0.3 V < VIN < VIL.*
2. *IIH is the input leakage current per I/O pin over recommended operating conditions VIH < VIN < VCCI. Input current is larger when operating outside recommended ranges.*
3. *Currents are measured at high temperature (100°C junction temperature) and maximum voltage.*
4. *Currents are measured at 85°C junction temperature.*

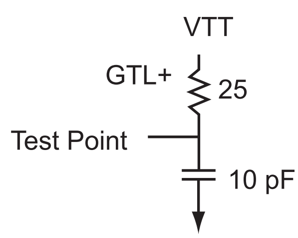

Figure 2-127 • AC Loading

Table 2-148 • AC Waveforms, Measuring Points, and Capacitive Loads

Input Low (V)	Input High (V)	Measuring Point* (V)	VREF (typ.) (V)	VTT (typ.) (V)	C_{LOAD} (pF)
VREF – 0.1	VREF + 0.1	1.0	1.0	1.5	10

*Note: *Measuring point = Vtrip. See Table 2-90 on page 2-166 for a complete table of trip points.*

Timing Characteristics

Table 2-149 • 2.5 V GTL+
Commercial Temperature Range Conditions: T_J = 70°C, Worst-Case VCC = 1.425 V, Worst-Case VCCI = 2.3 V, VREF = 1.0 V

Speed Grade	t_{DOUT}	t_{DP}	t_{DIN}	t_{PY}	t_{EOUT}	t_{ZL}	t_{ZH}	t_{LZ}	t_{HZ}	t_{ZLS}	t_{ZHS}	Units
Std.	0.66	2.21	0.04	1.51	0.43	2.25	2.10			4.48	4.34	ns
–1	0.56	1.88	0.04	1.29	0.36	1.91	1.79			3.81	3.69	ns
–2	0.49	1.65	0.03	1.13	0.32	1.68	1.57			3.35	4.34	ns

Note: For the derating values at specific junction temperature and voltage supply levels, refer to Table 3-7 on page 3-9.

DDR Module Specifications

Input DDR Module

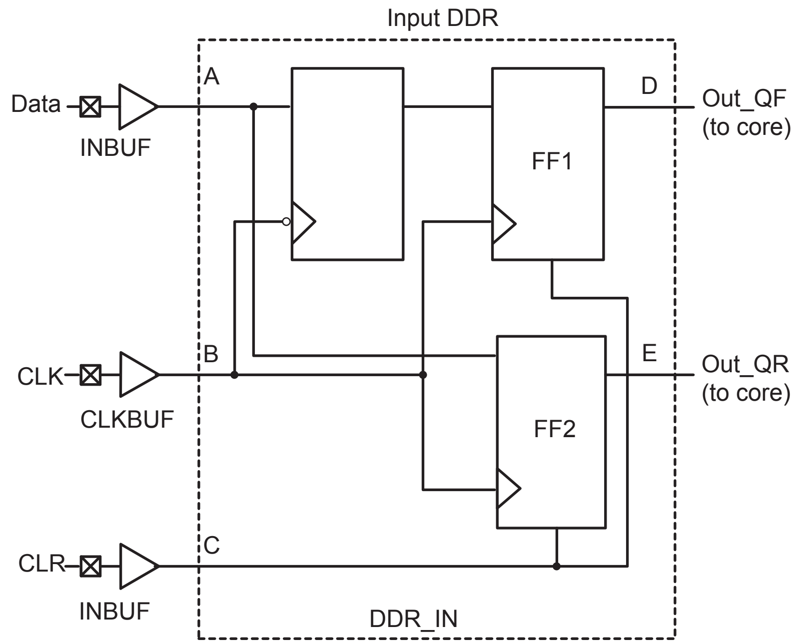

***Figure 2-142* • Input DDR Timing Model**

***Table 2-179* • Parameter Definitions**

Parameter Name	Parameter Definition	Measuring Nodes (from, to)
$t_{DDRICLKQ1}$	Clock-to-Out Out_QR	B, D
$t_{DDRICLKQ2}$	Clock-to-Out Out_QF	B, E
$t_{DDRISUD}$	Data Setup Time of DDR Input	A, B
t_{DDRIHD}	Data Hold Time of DDR Input	A, B
$t_{DDRICLR2Q1}$	Clear-to-Out Out_QR	C, D
$t_{DDRICLR2Q2}$	Clear-to-Out Out_QF	C, E
$t_{DDRIREMCLR}$	Clear Removal	C, B
$t_{DDRIRECCLR}$	Clear Recovery	C, B

Table 3-5 • **FPGA Programming, Storage, and Operating Limits**

Product Grade	Storage Temperature	Element	Grade Programming Cycles	Retention
Commercial	Min. T_J = 0°C	FPGA/FlashROM	500	20 years
	Max. T_J = 85°C	Embedded Flash	< 1,000	20 years
			< 10,000	10 years
			< 15,000	5 years
Industrial	Min. T_J = –40°C	FPGA/FlashROM	500	20 years
	Max. T_J = 100°C	Embedded Flash	< 1,000	20 years
			< 10,000	10 years
			< 15,000	5 years

I/O Power-Up and Supply Voltage Thresholds for Power-On Reset (Commercial and Industrial)

Sophisticated power-up management circuitry is designed into every Fusion device. These circuits ensure easy transition from the powered off state to the powered up state of the device. The many different supplies can power up in any sequence with minimized current spikes or surges. In addition, the I/O will be in a known state through the power-up sequence. The basic principle is shown in Figure 3-1 on page 3-6.

There are five regions to consider during power-up.

Fusion I/Os are activated only if ALL of the following three conditions are met:

1. VCC and VCCI are above the minimum specified trip points (Figure 3-1).
2. VCCI > VCC – 0.75 V (typical).
3. Chip is in the operating mode.

V_{CCI} Trip Point:

Ramping up: 0.6 V < trip_point_up < 1.2 V

Ramping down: 0.5 V < trip_point_down < 1.1 V

V_{CC} Trip Point:

Ramping up: 0.6 V < trip_point_up < 1.1 V

Ramping down: 0.5 V < trip_point_down < 1 V

VCC and VCCI ramp-up trip points are about 100 mV higher than ramp-down trip points. This specifically built-in hysteresis prevents undesirable power-up oscillations and current surges. Note the following:

- During programming, I/Os become tristated and weakly pulled up to VCCI.
- JTAG supply, PLL power supplies, and charge pump VPUMP supply have no influence on I/O behavior.

Internal Power-Up Activation Sequence

1. Core
2. Input buffers
3. Output buffers, after 200 ns delay from input buffer activation

PLL Behavior at Brownout Condition

Microsemi recommends using monotonic power supplies or voltage regulators to ensure proper power-up behavior. Power ramp-up should be monotonic at least until VCC and VCCPLX exceed brownout activation levels. The V_{CC} activation level is specified as 1.1 V worst-case (see Figure 3-1 on page 3-6 for more details).

When PLL power supply voltage and/or VCC levels drop below the VCC brownout levels (0.75 V ± 0.25 V), the PLL output lock signal goes low and/or the output clock is lost.

Power per I/O Pin

Table 3-12 • **Summary of I/O Input Buffer Power (per pin)—Default I/O Software Settings**

	VCCI (V)	Static Power PDC7 (mW)[1]	Dynamic Power PAC9 (µW/MHz)[2]
Applicable to Pro I/O Banks			
Single-Ended			
3.3 V LVTTL/LVCMOS	3.3	–	17.39
3.3 V LVTTL/LVCMOS – Schmitt trigger	3.3	–	25.51
2.5 V LVCMOS	2.5	–	5.76
2.5 V LVCMOS – Schmitt trigger	2.5	–	7.16
1.8 V LVCMOS	1.8	–	2.72
1.8 V LVCMOS – Schmitt trigger	1.8	–	2.80
1.5 V LVCMOS (JESD8-11)	1.5	–	2.08
1.5 V LVCMOS (JESD8-11) – Schmitt trigger	1.5	–	2.00
3.3 V PCI	3.3	–	18.82
3.3 V PCI – Schmitt trigger	3.3	–	20.12
3.3 V PCI-X	3.3	–	18.82
3.3 V PCI-X – Schmitt trigger	3.3	–	20.12
Voltage-Referenced			
3.3 V GTL	3.3	2.90	8.23
2.5 V GTL	2.5	2.13	4.78
3.3 V GTL+	3.3	2.81	4.14
2.5 V GTL+	2.5	2.57	3.71
HSTL (I)	1.5	0.17	2.03
HSTL (II)	1.5	0.17	2.03
SSTL2 (I)	2.5	1.38	4.48
SSTL2 (II)	2.5	1.38	4.48
SSTL3 (I)	3.3	3.21	9.26
SSTL3 (II)	3.3	3.21	9.26
Differential			
LVDS	2.5	2.26	1.50
LVPECL	3.3	5.71	2.17

Notes:

1. *PDC7 is the static power (where applicable) measured on VCCI.*
2. *PAC9 is the total dynamic power measured on VCC and VCCI.*

Revision	Changes	Page
v2.0, Revision 1 (continued)	The data in the 2.5 V LCMOS and LVCMOS 2.5 V / 5.0 V rows were updated in Table 2-75 • Fusion Standard and Advanced I/O – Hot-Swap and 5 V Input Tolerance Capabilities.	2-143
	In Table 2-78 • Fusion Standard I/O Standards—OUT_DRIVE Settings, LVCMOS 1.5 V, for OUT_DRIVE 2, was changed from a dash to a check mark.	2-152
	The "VCC15A Analog Power Supply (1.5 V)" definition was changed from "A 1.5 V analog power supply input should be used to provide this input" to "1.5 V clean analog power supply input for use by the 1.5 V portion of the analog circuitry."	2-223
	In the "VCC33PMP Analog Power Supply (3.3 V)" pin description, the following text was changed from "VCC33PMP should be powered up before or simultaneously with VCC33A" to "VCC33PMP should be powered up simultaneously with or after VCC33A."	2-223
	The "VCCOSC Oscillator Power Supply (3.3 V)" section was updated to include information about when to power the pin.	2-223
	In the "128-Bit AES Decryption" section, FIPS-192 was incorrect and changed to FIPS-197.	2-228
	The note in Table 2-84 • Fusion Standard and Advanced I/O Attributes vs. I/O Standard Applications was updated.	2-156
	For 1.5 V LVCMOS, the VIL and VIH parameters, 0.30 * VCCI was changed to 0.35 * VCCI and 0.70 * VCCI was changed to 0.65 * VCCI in Table 2-86 • Summary of Maximum and Minimum DC Input and Output Levels Applicable to Commercial and Industrial Conditions, Table 2-87 • Summary of Maximum and Minimum DC Input and Output Levels Applicable to Commercial and Industrial Conditions, and Table 2-88 • Summary of Maximum and Minimum DC Input and Output Levels Applicable to Commercial and Industrial Conditions. In Table 2-87 • Summary of Maximum and Minimum DC Input and Output Levels Applicable to Commercial and Industrial Conditions, the VIH max column was updated.	2-164 to 2-165
	Table 2-89 • Summary of Maximum and Minimum DC Input Levels Applicable to Commercial and Industrial Conditions was updated to include notes 3 and 4. The temperature ranges were also updated in notes 1 and 2.	2-165
	The titles in Table 2-92 • Summary of I/O Timing Characteristics – Software Default Settings to Table 2-94 • Summary of I/O Timing Characteristics – Software Default Settings were updated to "VCCI = I/O Standard Dependent."	2-167 to 2-168
	Below Table 2-98 • I/O Short Currents IOSH/IOSL, the paragraph was updated to change 110°C to 100°C and three months was changed to six months.	2-172
	Table 2-99 • Short Current Event Duration before Failure was updated to remove 110°C data.	2-174
	In Table 2-101 • I/O Input Rise Time, Fall Time, and Related I/O Reliability, LVTTL/LVCMOS rows were changed from 110°C to 100°C.	2-174
	VCC33PMP was added to Table 3-1 • Absolute Maximum Ratings. In addition, conditions for AV, AC, AG, and AT were also updated.	3-1
	VCC33PMP was added to Table 3-2 • Recommended Operating Conditions1. In addition, conditions for AV, AC, AG, and AT were also updated.	3-3
	Table 3-5 • FPGA Programming, Storage, and Operating Limits was updated to include new data and the temperature ranges were changed. The notes were removed from the table.	3-5
