
Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Active
Number of LABs/CLBs	-
Number of Logic Elements/Cells	-
Total RAM Bits	276480
Number of I/O	119
Number of Gates	1500000
Voltage - Supply	1.425V ~ 1.575V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	256-LBGA
Supplier Device Package	256-FPBGA (17x17)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/afs1500-fg256

RC Oscillator

The RC oscillator is an on-chip free-running clock source generating a 100 MHz clock. It can be used as a source clock for both on-chip and off-chip resources. When used in conjunction with the Fusion PLL and CCC circuits, the RC oscillator clock source can be used to generate clocks of varying frequency and phase.

The Fusion RC oscillator is very accurate at ±1% over commercial temperature ranges and and ±3% over industrial temperature ranges. It is an automated clock, requiring no setup or configuration by the user. It requires only that the power and GNDOSC pins be connected; no external components are required. The RC oscillator can be used to drive either a PLL or another internal signal.

RC Oscillator Characteristics

Table 2-9 • **Electrical Characteristics of RC Oscillator**

Parameter	Description	Conditions	Min.	Typ.	Max.	Units
F_{RC}	Operating Frequency			100		MHz
	Accuracy	Temperature: 0°C to 85°C Voltage: 3.3 V ± 5%		1		%
		Temperature: –40°C to 125°C Voltage: 3.3 V ± 5%		3		%
	Output Jitter	Period Jitter (at 5 k cycles)		100		ps
		Cycle–Cycle Jitter (at 5 k cycles)		100		ps
		Period Jitter (at 5 k cycles) with 1 KHz / 300 mV peak-to-peak noise on power supply		150		ps
		Cycle–Cycle Jitter (at 5 k cycles) with 1 KHz / 300 mV peak-to-peak noise on power supply		150		ps
	Output Duty Cycle			50		%
I_{DYNRC}	Operating Current			1		mA

***Table 2-16* • RTC Control/Status Register**

Bit	Name	Description	Default Value
7	rtc_rst	RTC Reset 1 – Resets the RTC 0 – Deassert reset on after two ACM_CLK cycle.	
6	cntr_en	Counter Enable 1 – Enables the counter; rtc_rst must be deasserted as well. First counter increments after 64 RTCCLK positive edges. 0 – Disables the crystal prescaler but does not reset the counter value. Counter value can only be updated when the counter is disabled.	0
5	vr_en_mat	Voltage Regulator Enable on Match 1 – Enables RTCMATCH and RTCPSMMATCH to output 1 when the counter value equals the Match Register value. This enables the 1.5 V voltage regulator when RTCPSMMATCH connects to the RTCPSMMATCH signal in VRPSM. 0 – RTCMATCH and RTCPSMMATCH output 0 at all times.	0
4:3	xt_mode[1:0]	Crystal Mode Controls RTCXTLMODE[1:0]. Connects to RTC_MODE signal in XTLOSC. XTL_MODE uses this value when xtal_en is 1. See the "Crystal Oscillator" section on page 2-20 for mode configuration.	00
2	rst_cnt_omat	Reset Counter on Match 1 – Enables the sync clear of the counter when the counter value equals the Match Register value. The counter clears on the rising edge of the clock. If all the Match Registers are set to 0, the clear is disabled. 0 – Counter increments indefinitely	0
1	rstb_cnt	Counter Reset, active Low 0 - Resets the 40-bit counter value	0
0	xtal_en	Crystal Enable Controls RTCXTLSEL. Connects to SELMODE signal in XTLOSC. 0 – XTLOSC enables control by FPGA_EN; xt_mode is not used. Sleep mode requires this bit to equal 0. 1 – Enables XTLOSC, XTL_MODE control by xt_mode Standby mode requires this bit to be set to 1. See the "Crystal Oscillator" section on page 2-20 for further details on SELMODE configuration.	0

Data operations are performed in widths of 1 to 4 bytes. A write to a location in a page that is not already in the Page Buffer will cause the page to be read from the FB Array and stored in the Page Buffer. The block that was addressed during the write will be put into the Block Buffer, and the data written by WD will overwrite the data in the Block Buffer. After the data is written to the Block Buffer, the Block Buffer is then written to the Page Buffer to keep both buffers in sync. Subsequent writes to the same block will overwrite the Block Buffer and the Page Buffer. A write to another block in the page will cause the addressed block to be loaded from the Page Buffer, and the write will be performed as described previously.

The data width can be selected dynamically via the DATAWIDTH input bus. The truth table for the data width settings is detailed in Table 2-21. The minimum resolvable address is one 8-bit byte. For data widths greater than 8 bits, the corresponding address bits are ignored—when DATAWIDTH = 0 (2 bytes), ADDR[0] is ignored, and when DATAWIDTH = '10' or '11' (4 bytes), ADDR[1:0] are ignored. Data pins are LSB-oriented and unused WD data pins must be grounded.

Table 2-21 • **Data Width Settings**

DATAWIDTH[1:0]	Data Width
00	1 byte [7:0]
01	2 byte [15:0]
10, 11	4 bytes [31:0]

Flash Memory Block Protection

Page Loss Protection

When the PAGELOSSPROTECT pin is set to logic 1, it prevents writes to any page other than the current page in the Page Buffer until the page is either discarded or programmed.

A write to another page while the current page is Page Loss Protected will return a STATUS of '11'.

Overwrite Protection

Any page that is Overwrite Protected will result in the STATUS being set to '01' when an attempt is made to either write, program, or erase it. To set the Overwrite Protection state for a page, set the OVERWRITEPROTECT pin when a Program operation is undertaken. To clear the Overwrite Protect state for a given page, an Unprotect Page operation must be performed on the page, and then the page must be programmed with the OVERWRITEPROTECT pin cleared to save the new page.

LOCKREQUEST

The LOCKREQUEST signal is used to give the user interface control over simultaneous access of the FB from both the User and JTAG interfaces. When LOCKREQUEST is asserted, the JTAG interface will hold off any access attempts until LOCKREQUEST is deasserted.

Flash Memory Block Operations

FB Operation Priority

The FB provides for priority of operations when multiple actions are requested simultaneously. Table 2-22 shows the priority order (priority 0 is the highest).

Table 2-22 • **FB Operation Priority**

Operation	Priority
System Initialization	0
FB Reset	1
Read	2
Write	3
Erase Page	4
Program	5
Unprotect Page	6
Discard Page	7

The following error indications are possible for Read operations:

1. STATUS = '01' when a single-bit data error was detected and corrected within the block addressed.
2. STATUS = '10' when a double-bit error was detected in the block addressed (note that the error is uncorrected).

In addition to data reads, users can read the status of any page in the FB by asserting PAGESTATUS along with REN. The format of the data returned by a page status read is shown in Table 2-23, and the definition of the page status bits is shown in Table 2-24.

***Table 2-23* • Page Status Read Data Format**

31	8	7	4	3	2	1	0
Write Count		Reserved		Over Threshold	Read Protected	Write Protected	Overwrite Protected

***Table 2-24* • Page Status Bit Definition**

Page Status Bit(s)	Definition
31–8	The number of times the page addressed has been programmed/erased
7–4	Reserved; read as 0
3	Over Threshold indicator (see the"Program Operation" section on page 2-46)
2	Read Protected; read protect bit for page, which is set via the JTAG interface and only affects JTAG operations. This bit can be overridden by using the correct user key value.
1	Write Protected; write protect bit for page, which is set via the JTAG interface and only affects JTAG operations. This bit can be overridden by using the correct user key value.
0	Overwrite Protected; designates that the user has set the OVERWRITEPROTECT bit on the interface while doing a Program operation. The page cannot be written without first performing an Unprotect Page operation.

SRAM and FIFO

All Fusion devices have SRAM blocks along the north side of the device. Additionally, AFS600 and AFS1500 devices have an SRAM block on the south side of the device. To meet the needs of high-performance designs, the memory blocks operate strictly in synchronous mode for both read and write operations. The read and write clocks are completely independent, and each may operate at any desired frequency less than or equal to 350 MHz. The following configurations are available:

- 4k×1, 2k×2, 1k×4, 512×9 (dual-port RAM—two read, two write or one read, one write)
- 512×9, 256×18 (two-port RAM—one read and one write)
- Sync write, sync pipelined/nonpipelined read

The Fusion SRAM memory block includes dedicated FIFO control logic to generate internal addresses and external flag logic (FULL, EMPTY, AFULL, AEMPTY).

During RAM operation, addresses are sourced by the user logic, and the FIFO controller is ignored. In FIFO mode, the internal addresses are generated by the FIFO controller and routed to the RAM array by internal MUXes. Refer to Figure 2-47 for more information about the implementation of the embedded FIFO controller.

The Fusion architecture enables the read and write sizes of RAMs to be organized independently, allowing for bus conversion. This is done with the WW (write width) and RW (read width) pins. The different D×W configurations are 256×18, 512×9, 1k×4, 2k×2, and 4k×1. For example, the write size can be set to 256×18 and the read size to 512×9.

Both the write and read widths for the RAM blocks can be specified independently with the WW (write width) and RW (read width) pins. The different D×W configurations are 256×18, 512×9, 1k×4, 2k×2, and 4k×1.

Refer to the allowable RW and WW values supported for each of the RAM macro types in Table 2-27 on page 2-58.

When a width of one, two, or four is selected, the ninth bit is unused. For example, when writing 9-bit values and reading 4-bit values, only the first four bits and the second four bits of each 9-bit value are addressable for read operations. The ninth bit is not accessible.

Direct Digital Input

The AV, AC, and AT pads can also be configured as high-voltage digital inputs (Figure 2-69). As these pads are 12 V–tolerant, the digital input can also be up to 12 V. However, the frequency at which these pads can operate is limited to 10 MHz.

To enable one of these analog input pads to operate as a digital input, its corresponding Digital Input Enable (DENA*xy*) pin on the Analog Block must be pulled High, where *x* is either V, C, or T (for AV, AC, or AT pads, respectively) and *y* is in the range 0 to 9, corresponding to the appropriate Analog Quad.

When the pad is configured as a digital input, the signal will come out of the Analog Block macro on the appropriate DA*x*OUT*y* pin, where *x* represents the pad type (V for AV pad, C for AC pad, or T for AT pad) and *y* represents the appropriate Analog Quad number. Example: If the AT pad in Analog Quad 5 is configured as a digital input, it will come out on the DATOUT5 pin of the Analog Block macro.

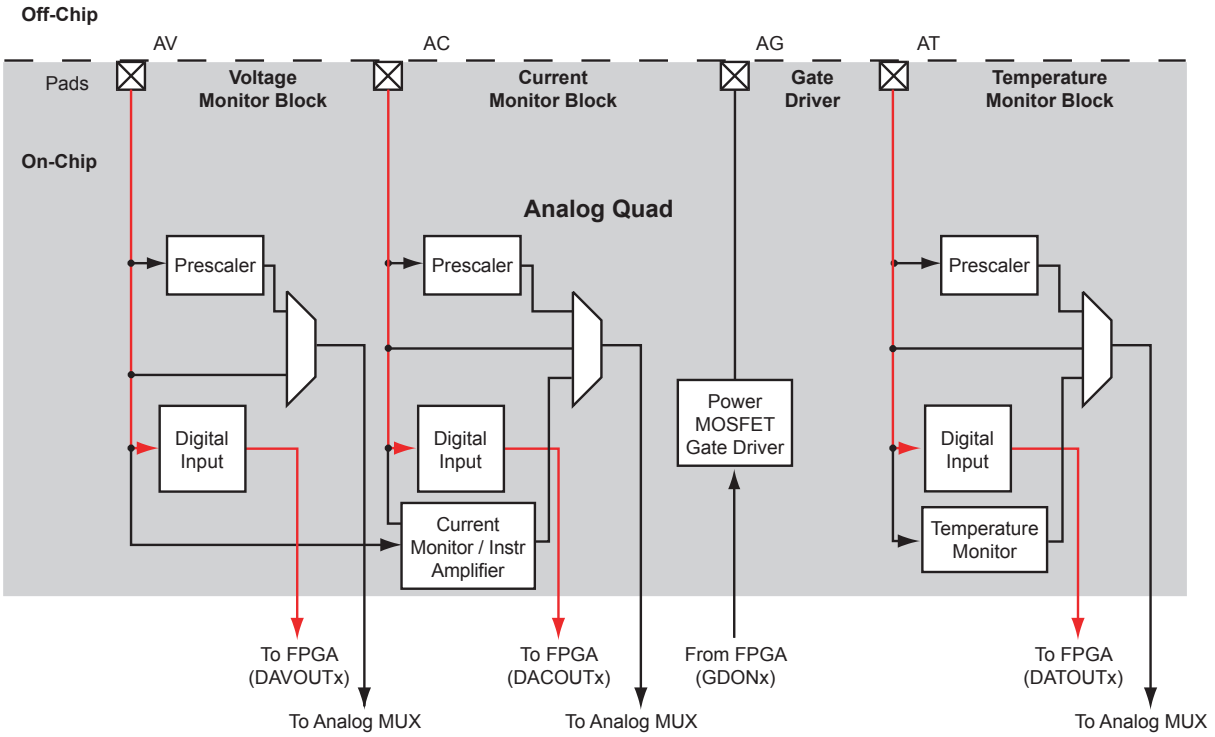

Figure 2-69 • **Analog Quad Direct Digital Input Configuration**

Temperature Monitor

The final pin in the Analog Quad is the Analog Temperature (AT) pin. The AT pin is used to implement an accurate temperature monitor in conjunction with an external diode-connected bipolar transistor (Figure 2-76). For improved temperature measurement accuracy, it is important to use the ATRTN pin for the return path of the current sourced by the AT pin. Each ATRTN pin is shared between two adjacent Analog Quads. Additionally, if not used for temperature monitoring, the AT pin can provide functionality similar to that of the AV pad. However, in this mode only positive voltages can be applied to the AT pin, and only two prescaler factors are available (16 V and 4 V ranges—refer to Table 2-57 on page 2-130).

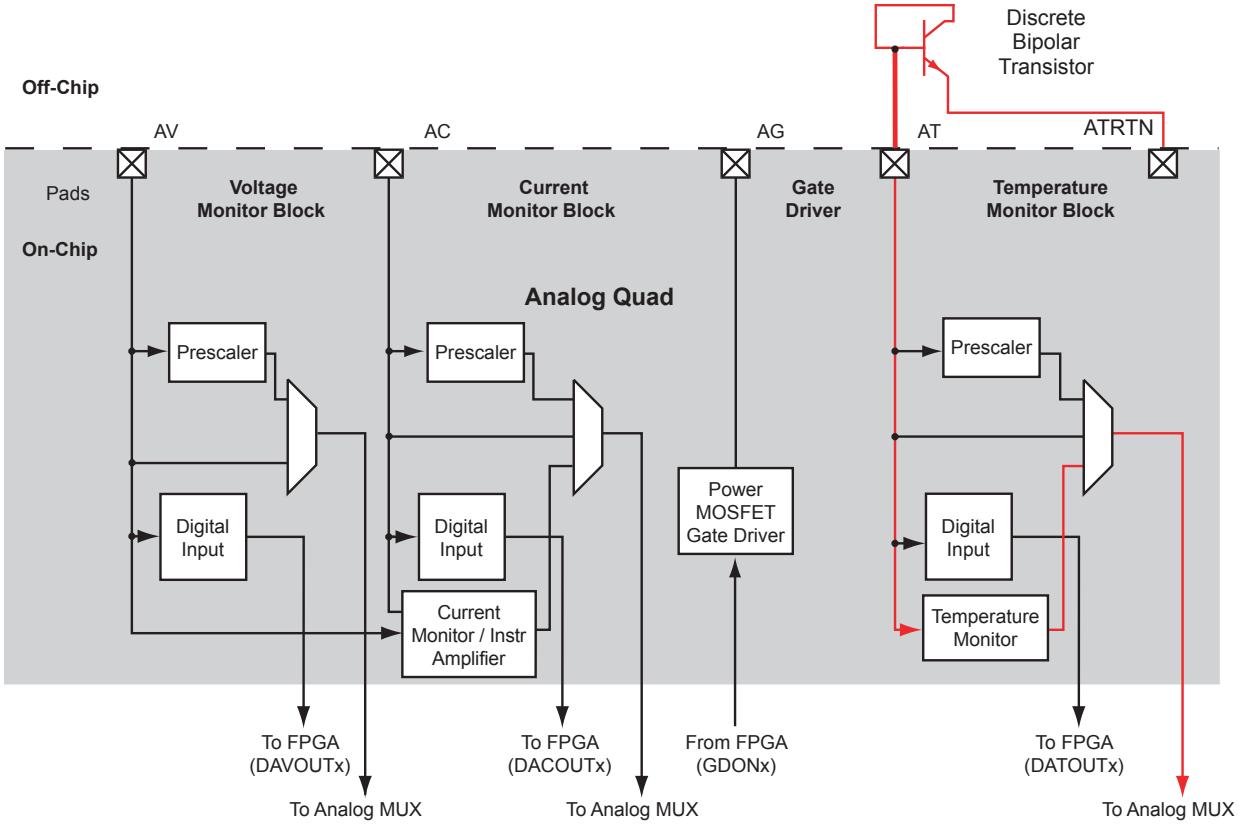

Figure 2-76 • **Temperature Monitor Quad**

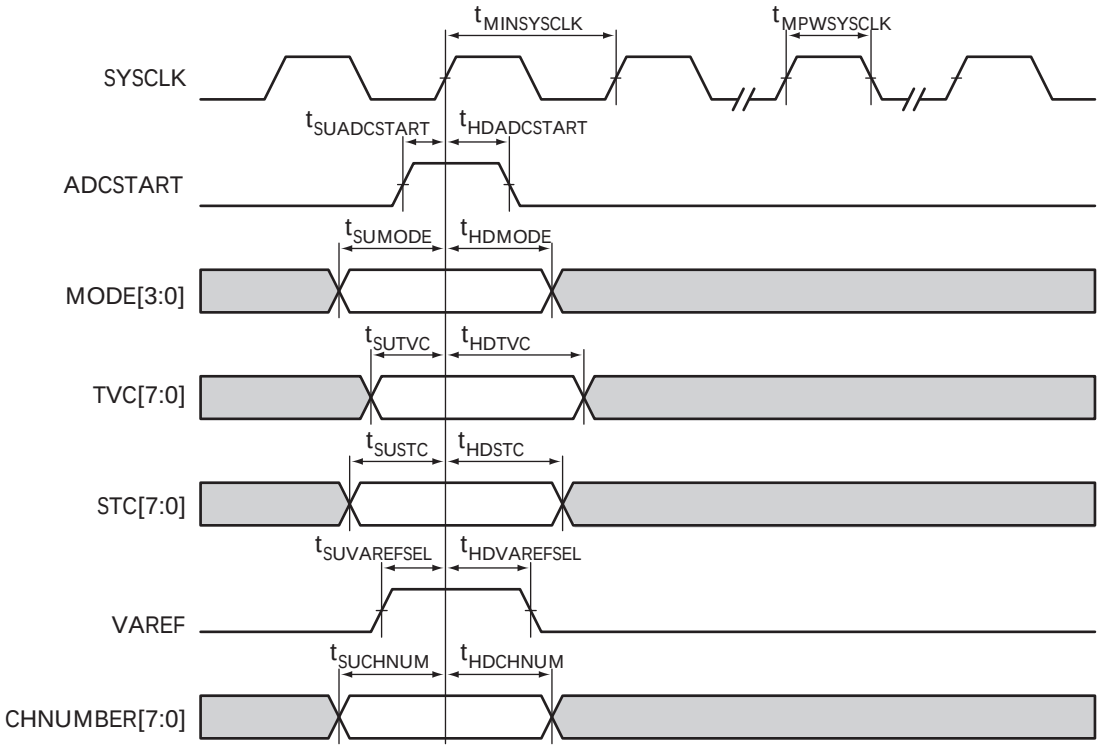

Figure 2-90 • **Input Setup Time**

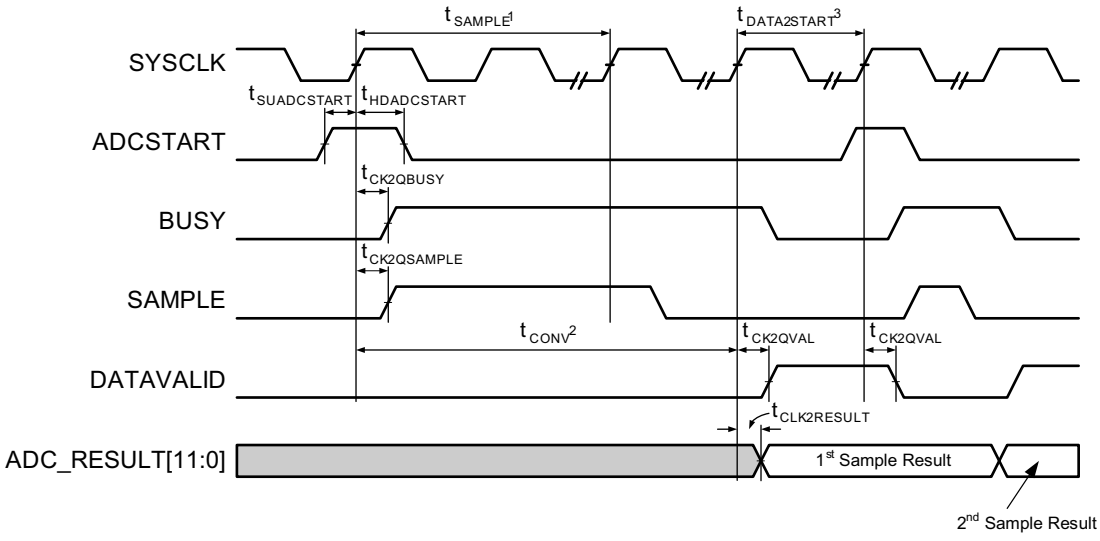
Standard Conversion



Notes:

1. *Refer to EQ 20 on page 2-109 for the calculation on the sample time, t_{SAMPLE}.*
2. *See EQ 23 on page 2-109 for calculation of the conversion time, t_{CONV}.*
3. *Minimum time to issue an ADCSTART after DATAVALID is 1 SYSCLK period*

Figure 2-91 • **Standard Conversion Status Signal Timing Diagram**

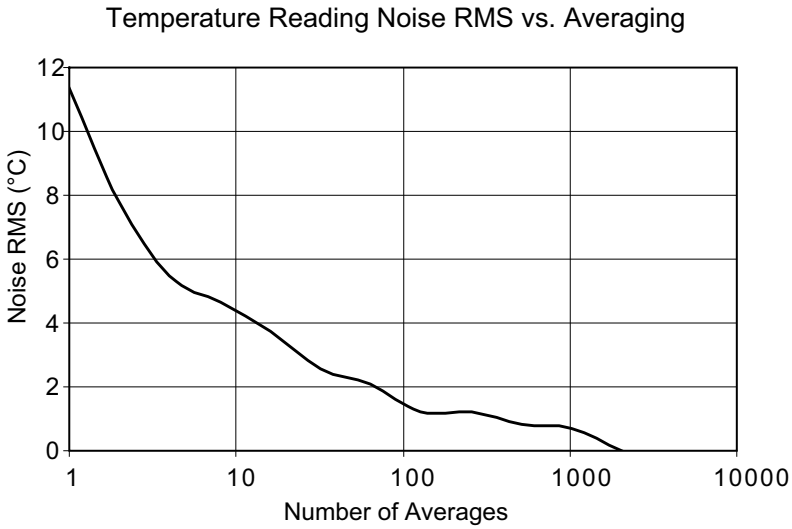


Figure 2-96 • **Temperature Reading Noise When Averaging is Used**

Table 2-49 • Analog Channel Specifications (continued)
Commercial Temperature Range Conditions, T_J = 85°C (unless noted otherwise), Typical: VCC33A = 3.3 V, VCC = 1.5 V

Parameter	Description	Condition	Min.	Typ.	Max.	Units
Temperature Monitor Using Analog Pad AT						
External Temperature Monitor (external diode 2N3904, T_J = 25°C)[4]	Resolution	8-bit ADC		4		°C
		10-bit ADC		1		°C
		12-bit ADC		0.25		°C
	Systematic Offset[5]	AFS090, AFS250, AFS600, AFS1500, uncalibrated[7]		5		°C
		AFS090, AFS250, AFS600, AFS1500, calibrated[7]		±5		°C
	Accuracy			±3	±5	°C
	External Sensor Source Current	High level, TMSTBx = 0		10		µA
		Low level, TMSTBx = 1		100		µA
	Max Capacitance on AT pad				1.3	nF
Internal Temperature Monitor	Resolution	8-bit ADC	4			°C
		10-bit ADC	1			°C
		12-bit ADC	0.25			°C
	Systematic Offset[5]	AFS090[7]		5		°C
		AFS250, AFS600, AFS1500[7]		11		°C
	Accuracy			±3	±5	°C
t_{TMSHI}	Strobe High time		10		105	µs
t_{TMSLO}	Strobe Low time		5			µs
t_{TMSSET}	Settling time		5			µs

Notes:

1. *VRSM is the maximum voltage drop across the current sense resistor.*
2. *Analog inputs used as digital inputs can tolerate the same voltage limits as the corresponding analog pad. There is no reliability concern on digital inputs as long as VIND does not exceed these limits.*
3. *VIND is limited to VCC33A + 0.2 to allow reaching 10 MHz input frequency.*
4. *An averaging of 1,024 samples (LPF setting in Analog System Builder) is required and the maximum capacitance allowed across the AT pins is 500 pF.*
5. *The temperature offset is a fixed positive value.*
6. *The high current mode has a maximum power limit of 20 mW. Appropriate current limit resistors must be used, based on voltage on the pad.*
7. *When using SmartGen Analog System Builder, CalibIP is required to obtain specified offset. For further details on CalibIP, refer to the "Temperature, Voltage, and Current Calibration in Fusion FPGAs" chapter of the* Fusion FPGA Fabric User Guide.

Table 2-50 • ADC Characteristics in Direct Input Mode
Commercial Temperature Range Conditions, T_J = 85°C (unless noted otherwise),
Typical: VCC33A = 3.3 V, VCC = 1.5 V

Parameter	Description	Condition	Min.	Typ.	Max.	Units
Direct Input using Analog Pad AV, AC, AT						
VINADC	Input Voltage (Direct Input)	Refer to Table 3-2 on page 3-3				
CINADC	Input Capacitance	Channel not selected		7		pF
		Channel selected but not sampling		8		pF
		Channel selected and sampling		18		pF
ZINADC	Input Impedance	8-bit mode		2		kΩ
		10-bit mode		2		kΩ
		12-bit mode		2		kΩ
Analog Reference Voltage VAREF						
VAREF	Accuracy	T_J = 25°C	2.537	2.56	2.583	V
	Temperature Drift of Internal Reference			65		ppm / °C
	External Reference		2.527		VCC33A + 0.05	V
ADC Accuracy (using external reference) [1,2]						
DC Accuracy						
TUE	Total Unadjusted Error	8-bit mode		0.29		LSB
		10-bit mode		0.72		LSB
		12-bit mode		1.8		LSB
INL	Integral Non-Linearity	8-bit mode		0.20	0.25	LSB
		10-bit mode		0.32	0.43	LSB
		12-bit mode		1.71	1.80	LSB
DNL	Differential Non-Linearity (no missing code)	8-bit mode		0.20	0.24	LSB
		10-bit mode		0.60	0.65	LSB
		12-bit mode		2.40	2.48	LSB
	Offset Error	8-bit mode		0.01	0.17	LSB
		10-bit mode		0.05	0.20	LSB
		12-bit mode		0.20	0.40	LSB
	Gain Error	8-bit mode		0.0004	0.003	LSB
		10-bit mode		0.002	0.011	LSB
		12-bit mode		0.007	0.044	LSB
	Gain Error (with internal reference)	All modes		2		% FSR

Notes:

1. *Accuracy of the external reference is 2.56 V ± 4.6 mV.*
2. *Data is based on characterization.*
3. *The sample rate is time-shared among active analog inputs.*

Table 2-57 details the settings available to control the prescaler values of the AV, AC, and AT pins. Note that the AT pin has a reduced number of available prescaler values.

***Table 2-57* • Prescaler Control Truth Table—AV (x = 0), AC (x = 1), and AT (x = 3)**

Control Lines Bx[2:0]	Scaling Factor, Pad to ADC Input	LSB for an 8-Bit Conversion[1] (mV)	LSB for a 10-Bit Conversion[1] (mV)	LSB for a 12-Bit Conversion[1] (mV)	Full-Scale Voltage in 10-Bit Mode[2]	Range Name
000 [3]	0.15625	64	16	4	16.368 V	16 V
001	0.3125	32	8	2	8.184 V	8 V
010 [3]	0.625	16	4	1	4.092 V	4 V
011	1.25	8	2	0.5	2.046 V	2 V
100	2.5	4	1	0.25	1.023 V	1 V
101	5.0	2	0.5	0.125	0.5115 V	0.5 V
110	10.0	1	0.25	0.0625	0.25575 V	0.25 V
111	20.0	0.5	0.125	0.03125	0.127875 V	0.125 V

Notes:

1. *LSB voltage equivalences assume VAREF = 2.56 V.*
2. *Full Scale voltage for n-bit mode: ((2^n) - 1) x (LSB for a n-bit Conversion)*
3. *These are the only valid ranges for the Temperature Monitor Block Prescaler.*

Table 2-58 details the settings available to control the MUX within each of the AV, AC, and AT circuits. This MUX determines whether the signal routed to the ADC is the direct analog input, prescaled signal, or output of either the Current Monitor Block or the Temperature Monitor Block.

***Table 2-58* • Analog Multiplexer Truth Table—AV (x = 0), AC (x = 1), and AT (x = 3)**

Control Lines Bx[4]	Control Lines Bx[3]	ADC Connected To
0	0	Prescaler
0	1	Direct input
1	0	Current amplifier temperature monitor
1	1	Not valid

Table 2-59 details the settings available to control the Direct Analog Input switch for the AV, AC, and AT pins.

***Table 2-59* • Direct Analog Input Switch Control Truth Table—AV (x = 0), AC (x = 1), and AT (x = 3)**

Control Lines Bx[5]	Direct Input Switch
0	Off
1	On

Table 2-60 details the settings available to control the polarity of the signals coming to the AV, AC, and AT pins. Note that the only valid setting for the AT pin is logic 0 to support positive voltages.

Table 2-60* • Voltage Polarity Control Truth Table—AV (x = 0), AC (x = 1), and AT (x = 3)

Control Lines Bx[6]	Input Signal Polarity
0	Positive
1	Negative

*Note: *The B3[6] signal for the AT pad should be kept at logic 0 to accept only positive voltages.*

Double Data Rate (DDR) Support

Fusion Pro I/Os support 350 MHz DDR inputs and outputs. In DDR mode, new data is present on every transition of the clock signal. Clock and data lines have identical bandwidths and signal integrity requirements, making it very efficient for implementing very high-speed systems.

DDR interfaces can be implemented using HSTL, SSTL, LVDS, and LVPECL I/O standards. In addition, high-speed DDR interfaces can be implemented using LVDS I/O.

Input Support for DDR

The basic structure to support a DDR input is shown in Figure 2-101. Three input registers are used to capture incoming data, which is presented to the core on each rising edge of the I/O register clock.

Each I/O tile on Fusion devices supports DDR inputs.

Output Support for DDR

The basic DDR output structure is shown in Figure 2-102 on page 2-140. New data is presented to the output every half clock cycle. Note: DDR macros and I/O registers do not require additional routing. The combiner automatically recognizes the DDR macro and pushes its registers to the I/O register area at the edge of the chip. The routing delay from the I/O registers to the I/O buffers is already taken into account in the DDR macro.

Refer to the application note *Using DDR for Fusion Devices* for more information.

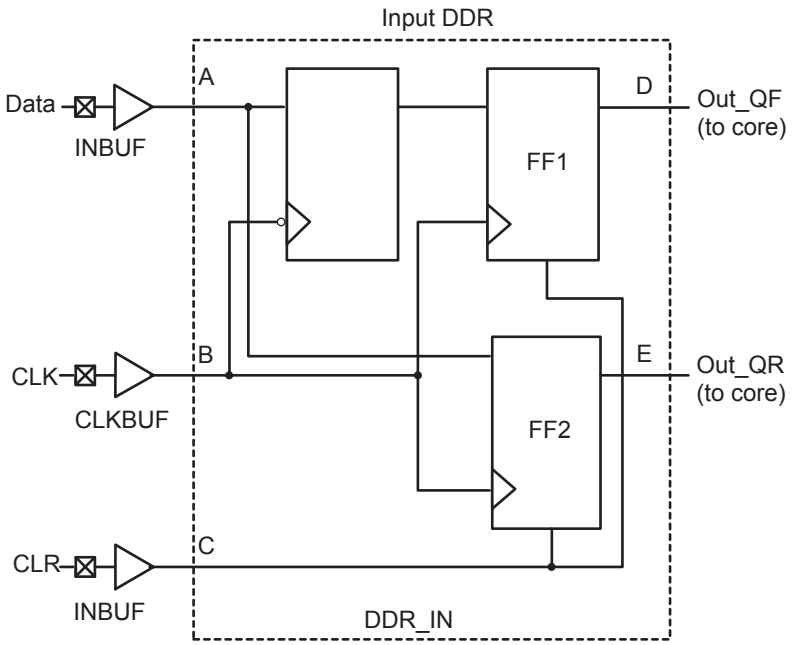

***Figure 2-101* • DDR Input Register Support in Fusion Devices**

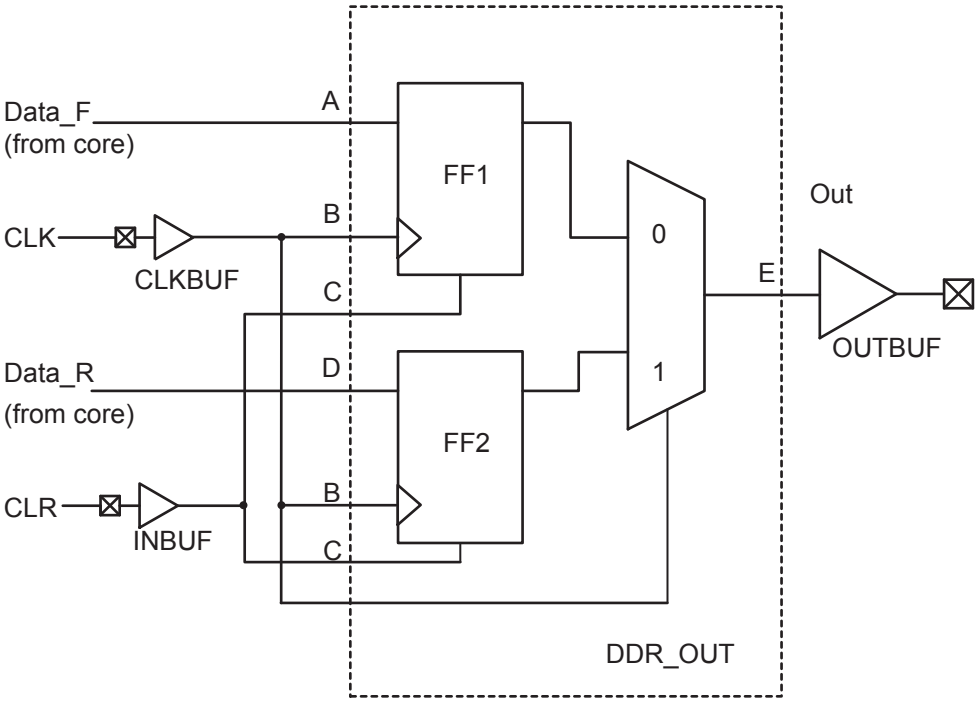

***Figure 2-102* • DDR Output Support in Fusion Devices**

Table 2-113 • 2.5 V LVCMOS High Slew

Note: For the derating values at specific junction temperature and voltage supply levels, refer to Table 3-7 on page 3-9.

Differential I/O Characteristics

Configuration of the I/O modules as a differential pair is handled by the Microsemi Designer software when the user instantiates a differential I/O macro in the design.

Differential I/Os can also be used in conjunction with the embedded Input Register (InReg), Output Register (OutReg), Enable Register (EnReg), and Double Data Rate (DDR). However, there is no support for bidirectional I/Os or tristates with these standards.

LVDS

Low-Voltage Differential Signal (ANSI/TIA/EIA-644) is a high-speed differential I/O standard. It requires that one data bit be carried through two signal lines, so two pins are needed. It also requires external resistor termination.

The full implementation of the LVDS transmitter and receiver is shown in an example in Figure 2-134. The building blocks of the LVDS transmitter–receiver are one transmitter macro, one receiver macro, three board resistors at the transmitter end, and one resistor at the receiver end. The values for the three driver resistors are different from those used in the LVPECL implementation because the output standard specifications are different.

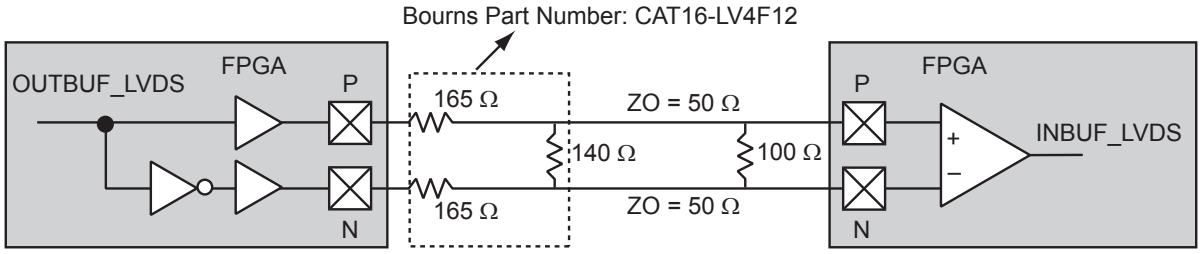

***Figure 2-134* • LVDS Circuit Diagram and Board-Level Implementation**

***Table 2-168* • Minimum and Maximum DC Input and Output Levels**

DC Parameter	Description	Min.	Typ.	Max.	Units
VCCI	Supply Voltage	2.375	2.5	2.625	V

VIDIFF	Input Differential Voltage	100	350		mV

Notes:

1. *IOL/IOH defined by VODIFF/(Resistor Network)*
2. *Currents are measured at 85°C junction temperature.*
3. *IIL is the input leakage current per I/O pin over recommended operation conditions where –0.3 V < VIN < VIL.*
4. *IIH is the input leakage current per I/O pin over recommended operating conditions VIH < VIN < VCCI. Input current is larger when operating outside recommended ranges.*

Table 3-1 • **Absolute Maximum Ratings (continued)**

Symbol	Parameter	Commercial	Industrial	Units
AV, AC	Unpowered, ADC reset asserted or unconfigured	–11.0 to 12.6	–11.0 to 12.0	V
	Analog input (+16 V to +2 V prescaler range)	–0.4 to 12.6	–0.4 to 12.0	V
	Analog input (+1 V to +0.125 V prescaler range)	–0.4 to 3.75	–0.4 to 3.75	V
	Analog input (–16 V to –2 V prescaler range)	–11.0 to 0.4	–11.0 to 0.4	V
	Analog input (–1 V to –0.125 V prescaler range)	–3.75 to 0.4	–3.75 to 0.4	V
	Analog input (direct input to ADC)	–0.4 to 3.75	–0.4 to 3.75	V
	Digital input	–0.4 to 12.6	–0.4 to 12.0	V
AG	Unpowered, ADC reset asserted or unconfigured	–11.0 to 12.6	–11.0 to 12.0	V
	Low Current Mode (1 µA, 3 µA, 10 µA, 30 µA)	–0.4 to 12.6	–0.4 to 12.0	V
	Low Current Mode (–1 µA, –3 µA, –10 µA, –30 µA)	–11.0 to 0.4	–11.0 to 0.4	V
	High Current Mode [3]	–11.0 to 12.6	–11.0 to 12.0	V
AT	Unpowered, ADC reset asserted or unconfigured	–0.4 to 16.0	–0.4 to 15.0	V
	Analog input (+16 V, 4 V prescaler range)	–0.4 to 16.0	–0.4 to 15.0	V
	Analog input (direct input to ADC)	–0.4 to 3.75	–0.4 to 3.75	V
	Digital input	–0.4 to 16.0	–0.4 to 15.0	V
T_{STG} [4]	Storage temperature	–65 to +150		°C
T_J [4]	Junction temperature	+125		°C

Notes:

1. *The device should be operated within the limits specified by the datasheet. During transitions, the input signal may undershoot or overshoot according to the limits shown in Table 3-4 on page 3-4.*
2. *Analog data not valid beyond 3.65 V.*
3. *The high current mode has a maximum power limit of 20 mW. Appropriate current limit resistors must be used, based on voltage on the pad.*
4. *For flash programming and retention maximum limits, refer to Table 3-5 on page 3-5. For recommended operating limits refer to Table 3-2 on page 3-3.*

RC Oscillator Dynamic Contribution—$P_{RC\text{-}OSC}$

Operating Mode

$P_{RC\text{-}OSC}$ = PAC19

Standby Mode and Sleep Mode

$P_{RC\text{-}OSC}$ = 0 W

Analog System Dynamic Contribution—P_{AB}

Operating Mode

P_{AB} = PAC20

Standby Mode and Sleep Mode

P_{AB} = 0 W

Guidelines

Toggle Rate Definition

A toggle rate defines the frequency of a net or logic element relative to a clock. It is a percentage. If the toggle rate of a net is 100%, this means that the net switches at half the clock frequency. Below are some examples:

- The average toggle rate of a shift register is 100%, as all flip-flop outputs toggle at half of the clock frequency.
- The average toggle rate of an 8-bit counter is 25%:
  - Bit 0 (LSB) = 100%
  - Bit 1 = 50%
  - Bit 2 = 25%
  - …
  - Bit 7 (MSB) = 0.78125%
  - Average toggle rate = (100% + 50% + 25% + 12.5% + . . . 0.78125%) / 8.

Enable Rate Definition

Output enable rate is the average percentage of time during which tristate outputs are enabled. When non-tristate output buffers are used, the enable rate should be 100%.

***Table 3-16* • Toggle Rate Guidelines Recommended for Power Calculation**

Component	Definition	Guideline
α_1	Toggle rate of VersaTile outputs	10%
α_2	I/O buffer toggle rate	10%

***Table 3-17* • Enable Rate Guidelines Recommended for Power Calculation**

Component	Definition	Guideline
β_1	I/O output buffer enable rate	100%
β_2	RAM enable rate for read operations	12.5%
β_3	RAM enable rate for write operations	12.5%
β_4	NVM enable rate for read operations	0%
