Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Active
Number of LABs/CLBs	-
Number of Logic Elements/Cells	-
Total RAM Bits	276480
Number of I/O	119
Number of Gates	1500000
Voltage - Supply	1.425V ~ 1.575V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	256-LBGA
Supplier Device Package	256-FPBGA (17x17)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/afs1500-fgg256

Specifying I/O States During Programming

You can modify the I/O states during programming in FlashPro. In FlashPro, this feature is supported for PDB files generated from Designer v8.5 or greater. See the *FlashPro User Guide* for more information.

Note: PDB files generated from Designer v8.1 to Designer v8.4 (including all service packs) have limited display of Pin Numbers only.

The I/Os are controlled by the JTAG Boundary Scan register during programming, except for the analog pins (AC, AT and AV). The Boundary Scan register of the AG pin can be used to enable/disable the gate driver in software v9.0.

1. Load a PDB from the FlashPro GUI. You must have a PDB loaded to modify the I/O states during programming.
2. From the FlashPro GUI, click **PDB Configuration**. A FlashPoint – Programming File Generator window appears.
3. Click the **Specify I/O States During Programming** button to display the Specify I/O States During Programming dialog box.
4. Sort the pins as desired by clicking any of the column headers to sort the entries by that header. Select the I/Os you wish to modify (Figure 1-3).
5. Set the I/O Output State. You can set Basic I/O settings if you want to use the default I/O settings for your pins, or use Custom I/O settings to customize the settings for each pin. Basic I/O state settings:

   1 – I/O is set to drive out logic High

   0 – I/O is set to drive out logic Low

   Last Known State – I/O is set to the last value that was driven out prior to entering the programming mode, and then held at that value during programming

   Z -Tri-State: I/O is tristated

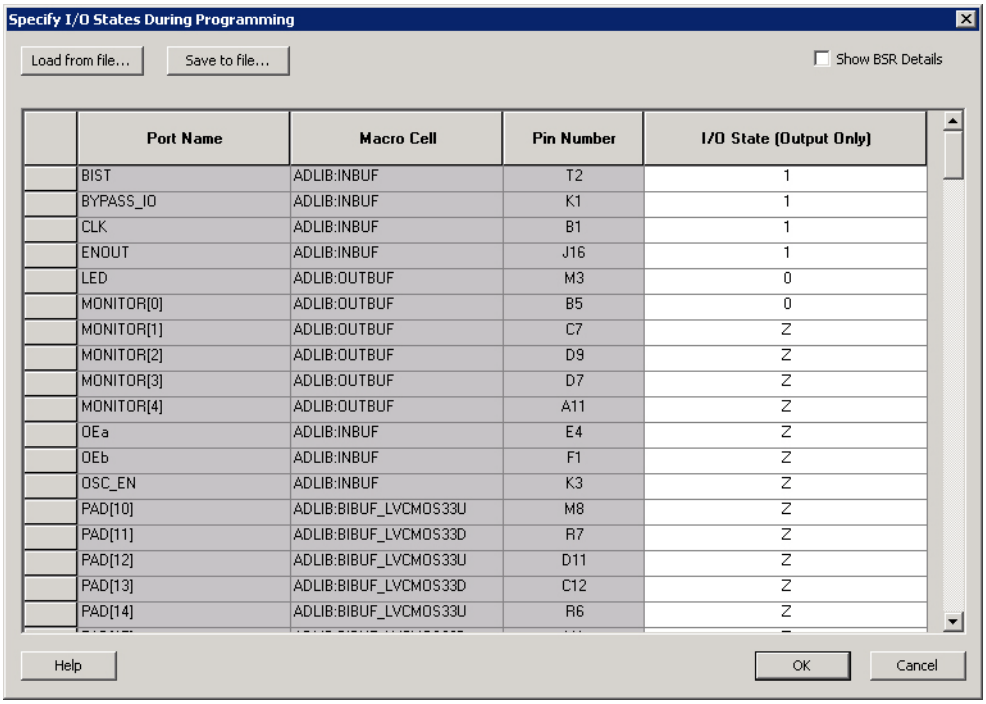

Figure 1-3 • **I/O States During Programming Window**

6. Click **OK** to return to the FlashPoint – Programming File Generator window.

I/O States During programming are saved to the ADB and resulting programming files after completing programming file generation.

2 – Device Architecture

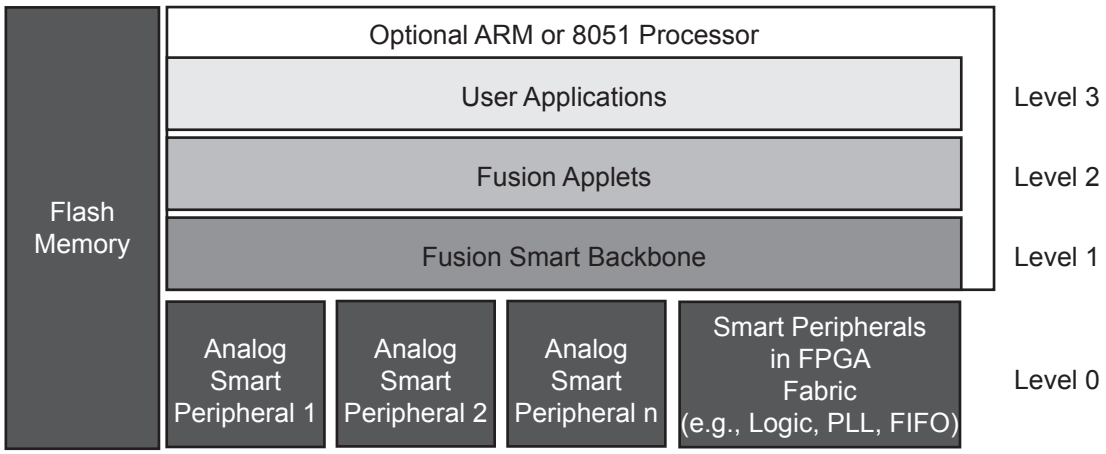
Fusion Stack Architecture

To manage the unprecedented level of integration in Fusion devices, Microsemi developed the Fusion technology stack (Figure 2-1). This layered model offers a flexible design environment, enabling design at very high and very low levels of abstraction. Fusion peripherals include hard analog IP and hard and soft digital IP. Peripherals communicate across the FPGA fabric via a layer of soft gates—the Fusion backbone. Much more than a common bus interface, this Fusion backbone integrates a micro-sequencer within the FPGA fabric and configures the individual peripherals and supports low-level processing of peripheral data. Fusion applets are application building blocks that can control and respond to peripherals and other system signals. Applets can be rapidly combined to create large applications. The technology is scalable across devices, families, design types, and user expertise, and supports a well-defined interface for external IP and tool integration.

At the lowest level, Level 0, are Fusion peripherals. These are configurable functional blocks that can be hardwired structures such as a PLL or analog input channel, or soft (FPGA gate) blocks such as a UART or two-wire serial interface. The Fusion peripherals are configurable and support a standard interface to facilitate communication and implementation.

Connecting and controlling access to the peripherals is the Fusion backbone, Level 1. The backbone is a soft-gate structure, scalable to any number of peripherals. The backbone is a bus and much more; it manages peripheral configuration to ensure proper operation. Leveraging the common peripheral interface and a low-level state machine, the backbone efficiently offloads peripheral management from the system design. The backbone can set and clear flags based upon peripheral behavior and can define performance criteria. The flexibility of the stack enables a designer to configure the silicon, directly bypassing the backbone if that level of control is desired.

One step up from the backbone is the Fusion applet, Level 2. The applet is an application building block that implements a specific function in FPGA gates. It can react to stimuli and board-level events coming through the backbone or from other sources, and responds to these stimuli by accessing and manipulating peripherals via the backbone or initiating some other action. An applet controls or responds to the peripheral(s). Applets can be easily imported or exported from the design environment. The applet structure is open and well-defined, enabling users to import applets from Microsemi, system developers, third parties, and user groups.



Note: Levels 1, 2, and 3 are implemented in FPGA logic gates.

Figure 2-1 • **Fusion Architecture Stack**

Read Next Operation

The Read Next operation is a feature by which the next block relative to the block in the Block Buffer is read from the FB Array while performing reads from the Block Buffer. The goal is to minimize wait states during consecutive sequential Read operations.

The Read Next operation is performed in a predetermined manner because it does look-ahead reads. The general look-ahead function is as follows:

- Within a page, the next block fetched will be the next in linear address.
- When reading the last data block of a page, it will fetch the first block of the next page.
- When reading spare pages, it will read the first block of the next sector's spare page.
- Reads of the last sector will wrap around to sector 0.
- Reads of Auxiliary blocks will read the next linear page's Auxiliary block.

When an address on the ADDR input does not agree with the predetermined look-ahead address, there is a time penalty for this access. The FB will be busy finishing the current look-ahead read before it can start the next read. The worst case is a total of nine BUSY cycles before data is delivered.

The Non-Pipe Mode and Pipe Mode waveforms for Read Next operations are illustrated in Figure 2-40 and Figure 2-41.

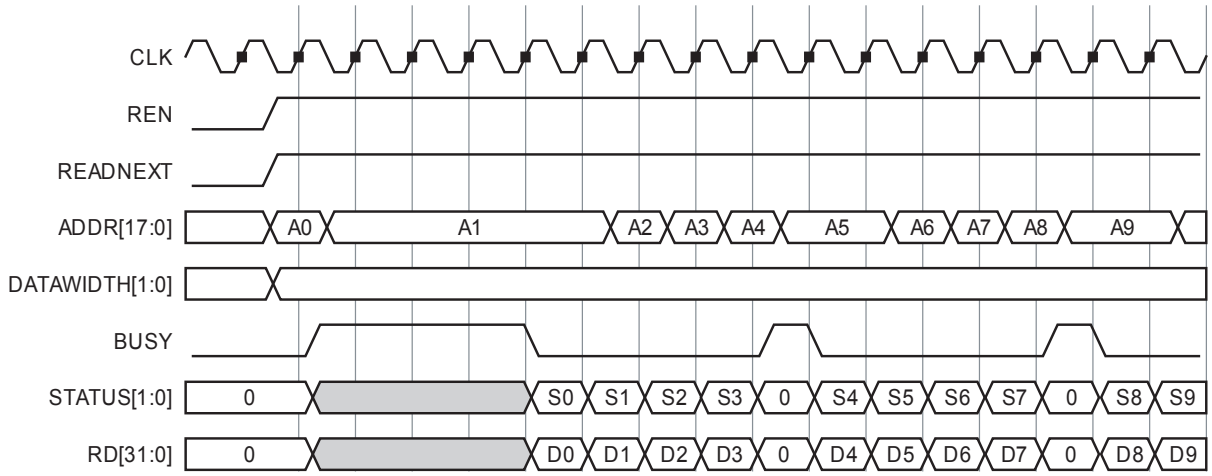


***Figure 2-40* • Read Next Waveform (Non-Pipe Mode, 32-bit access)**

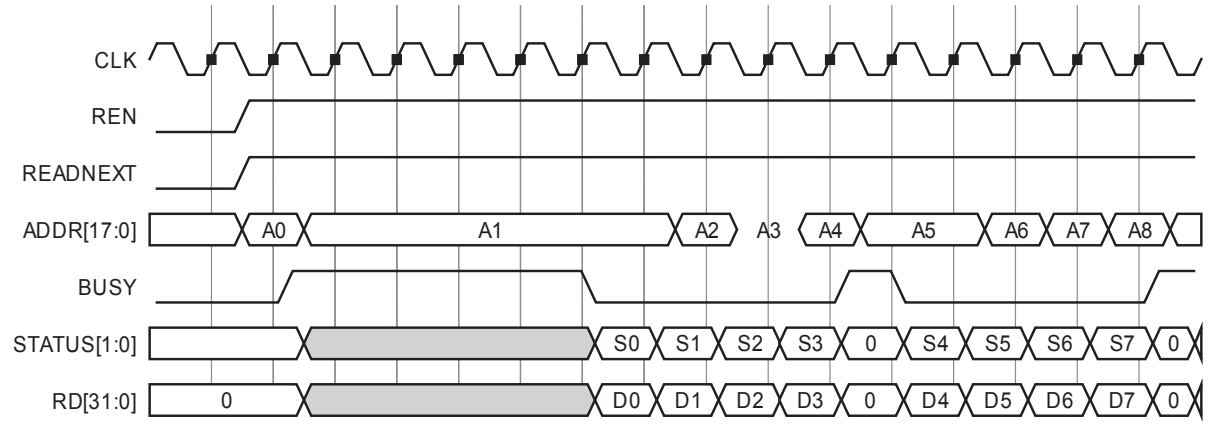

***Figure 2-41* • Read Next WaveForm (Pipe Mode, 32-bit access)**

Modes of Operation

There are two read modes and one write mode:

- Read Nonpipelined (synchronous—1 clock edge): In the standard read mode, new data is driven onto the RD bus in the same clock cycle following RA and REN valid. The read address is registered on the read port clock active edge, and data appears at RD after the RAM access time. Setting PIPE to OFF enables this mode.
- Read Pipelined (synchronous—2 clock edges): The pipelined mode incurs an additional clock delay from the address to the data but enables operation at a much higher frequency. The read address is registered on the read port active clock edge, and the read data is registered and appears at RD after the second read clock edge. Setting PIPE to ON enables this mode.
- Write (synchronous—1 clock edge): On the write clock active edge, the write data is written into the SRAM at the write address when WEN is High. The setup times of the write address, write enables, and write data are minimal with respect to the write clock. Write and read transfers are described with timing requirements in the "SRAM Characteristics" section on page 2-63 and the "FIFO Characteristics" section on page 2-72.

RAM Initialization

Each SRAM block can be individually initialized on power-up by means of the JTAG port using the UJTAG mechanism (refer to the "JTAG IEEE 1532" section on page 2-229 and the *Fusion SRAM/FIFO Blocks* application note). The shift register for a target block can be selected and loaded with the proper bit configuration to enable serial loading. The 4,608 bits of data can be loaded in a single operation.

TUE – Total Unadjusted Error

TUE is a comprehensive specification that includes linearity errors, gain error, and offset error. It is the worst-case deviation from the ideal device performance. TUE is a static specification (Figure 2-87).

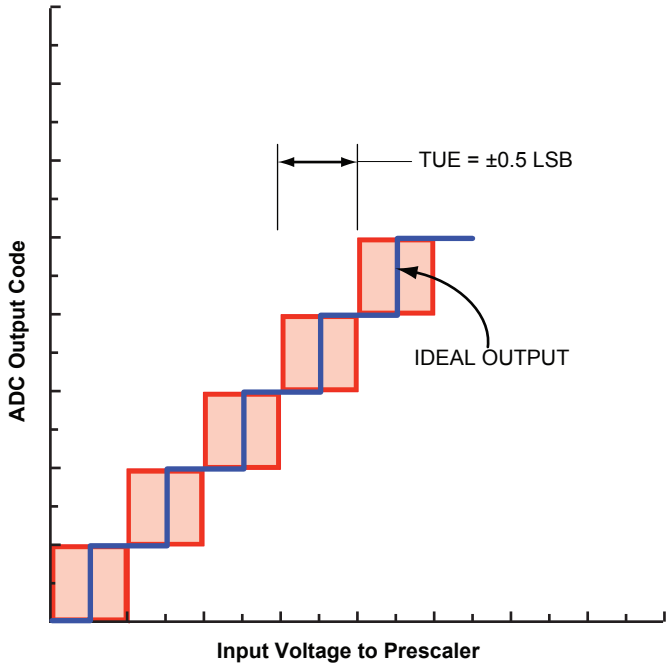

***Figure 2-87* • Total Unadjusted Error (TUE)**

ADC Operation

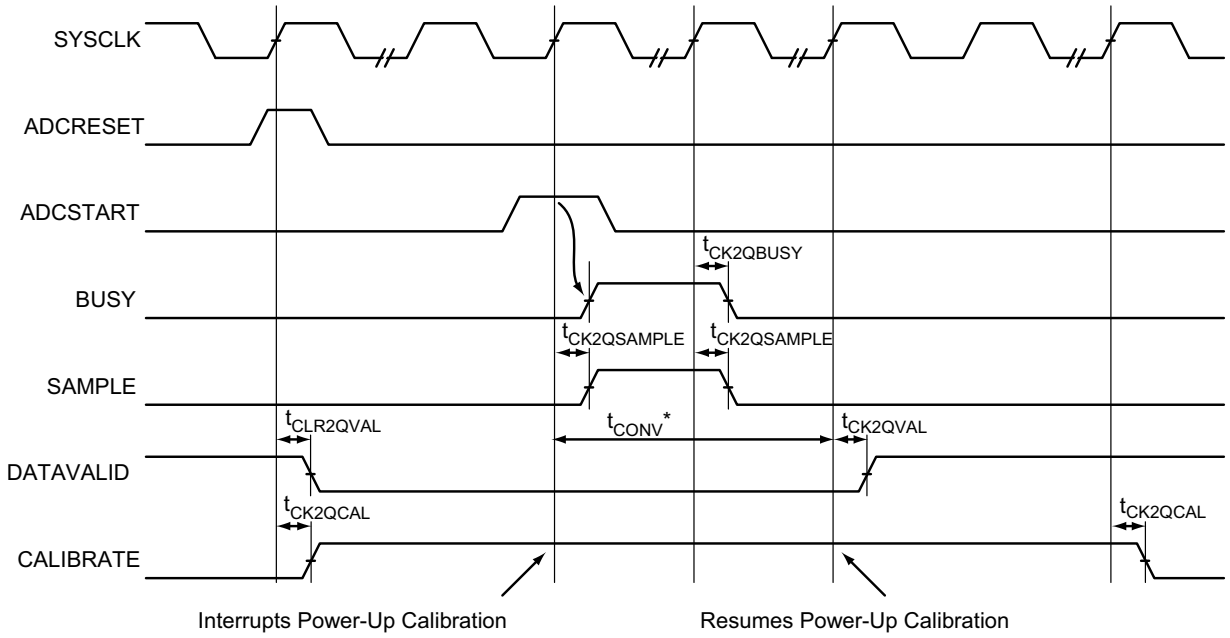
Once the ADC has powered up and been released from reset, ADCRESET, the ADC will initiate a calibration routine designed to provide optimal ADC performance. The Fusion ADC offers a robust calibration scheme to reduce integrated offset and linearity errors. The offset and linearity errors of the main capacitor array are compensated for with an 8-bit calibration capacitor array. The offset/linearity error calibration is carried out in two ways. First, a power-up calibration is carried out when the ADC comes out of reset. This is initiated by the CALIBRATE output of the Analog Block macro and is a fixed number of ADC_CLK cycles (3,840 cycles), as shown in Figure 2-89 on page 2-111. In this mode, the linearity and offset errors of the capacitors are calibrated.

To further compensate for drift and temperature-dependent effects, every conversion is followed by post-calibration of either the offset or a bit of the main capacitor array. The post-calibration ensures that, over time and with temperature, the ADC remains consistent.

After both calibration and the setting of the appropriate configurations, as explained above, the ADC is ready for operation. Setting the ADCSTART signal high for one clock period will initiate the sample and conversion of the analog signal on the channel as configured by CHNUMBER[4:0]. The status signals SAMPLE and BUSY will show when the ADC is sampling and converting (Figure 2-91 on page 2-112). Both SAMPLE and BUSY will initially go high. After the ADC has sampled and held the analog signal, SAMPLE will go low. After the entire operation has completed and the analog signal is converted, BUSY will go low and DATAVALID will go high. This indicates that the digital result is available on the RESULT[11:0] pins.

DATAVALID will remain high until a subsequent ADCSTART is issued. The DATAVALID goes low on the rising edge of SYSCLK as shown in Figure 2-90 on page 2-112. The RESULT signals will be kept constant until the ADC finishes the subsequent sample. The next sampled RESULT will be available when DATAVALID goes high again. It is ideal to read the RESULT when DATAVALID is '1'. The RESULT is latched and remains unchanged until the next DATAVLAID rising edge.

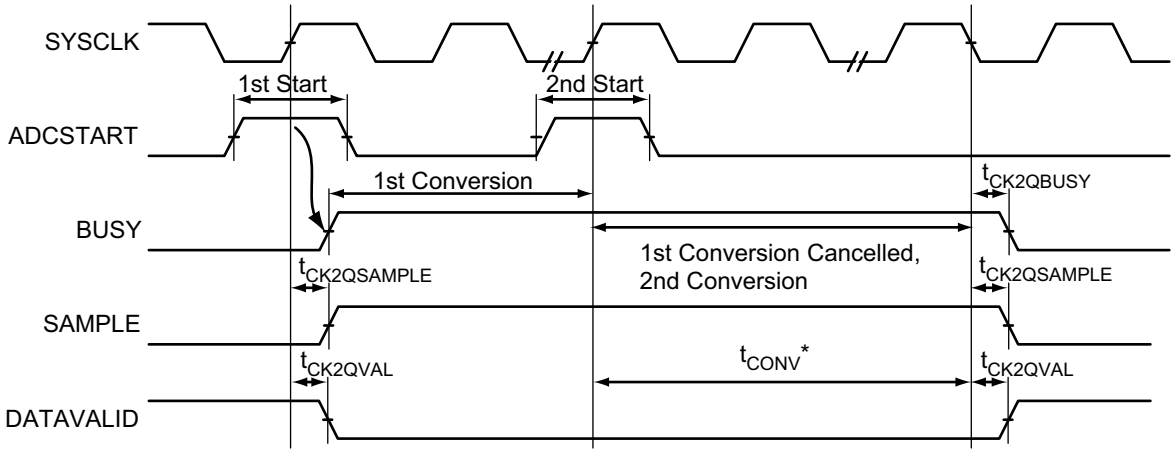
Intra-Conversion



*Note: *t_{CONV} represents the conversion time of the second conversion. See EQ 23 on page 2-109 for calculation of the conversion time, t_{CONV}.*

Figure 2-92 • **Intra-Conversion Timing Diagram**

Injected Conversion



*Note: *See EQ 23 on page 2-109 for calculation on the conversion time, t_{CONV}.*

Figure 2-93 • **Injected Conversion Timing Diagram**

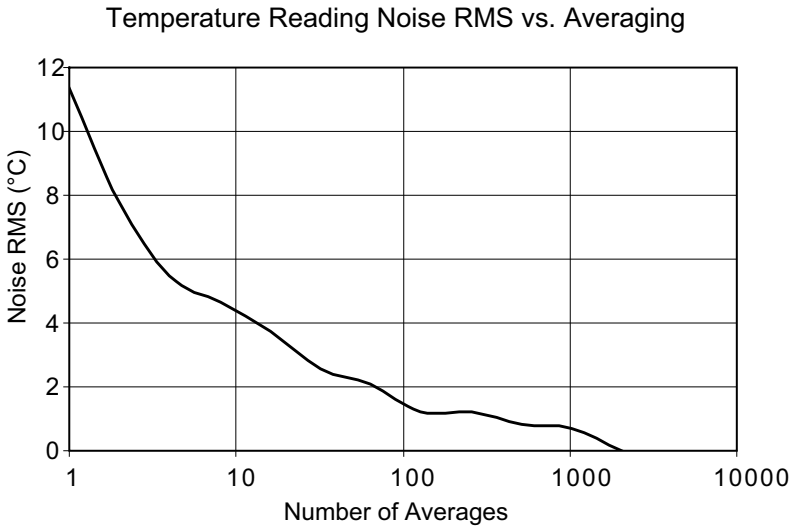


Figure 2-96 • **Temperature Reading Noise When Averaging is Used**

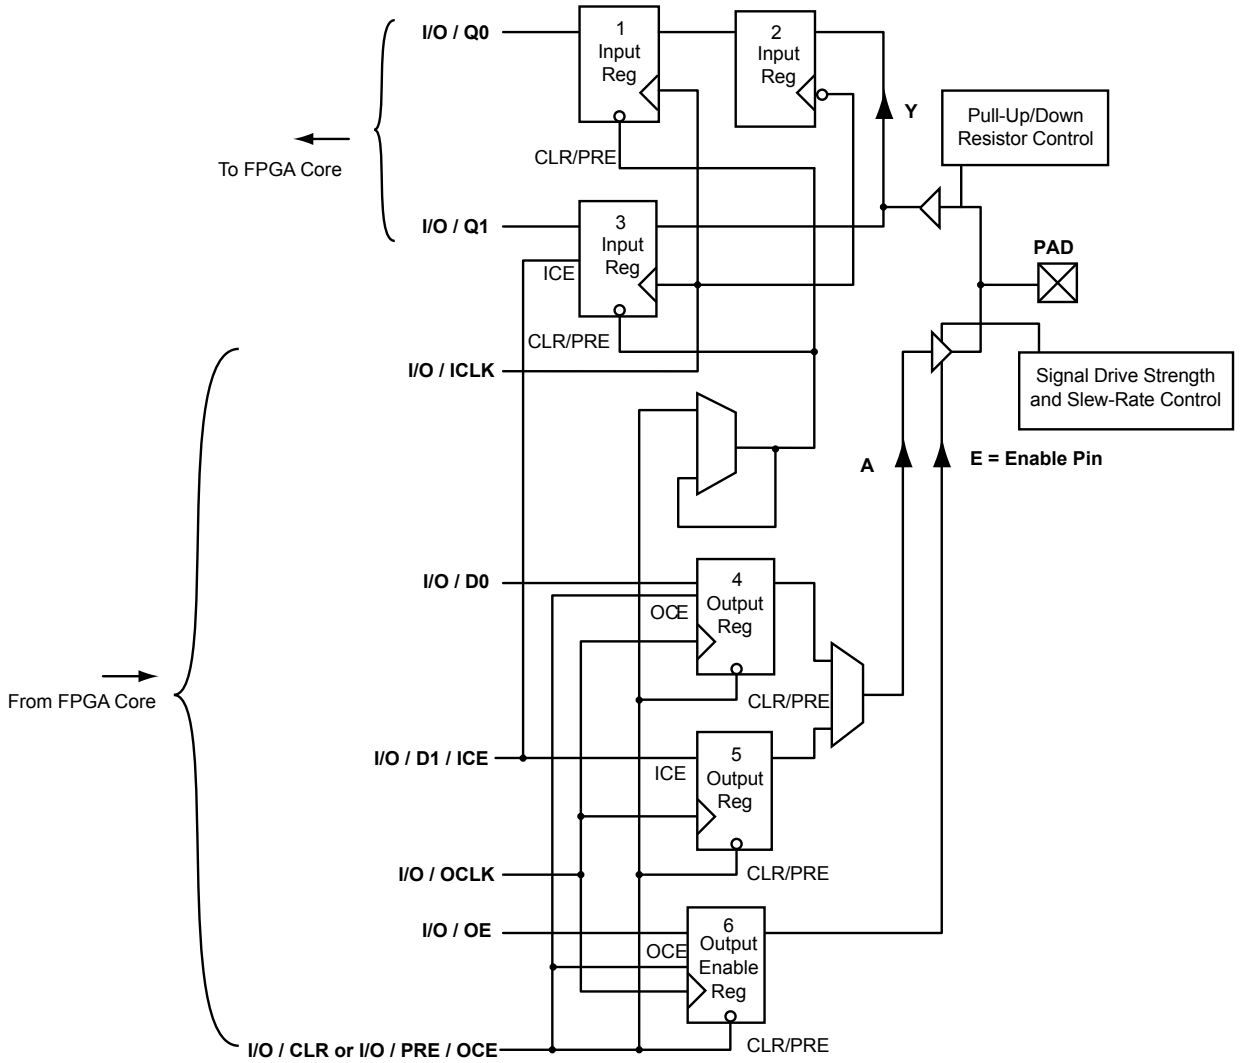
I/O Registers

Each I/O module contains several input, output, and enable registers. Refer to Figure 2-100 for a simplified representation of the I/O block.

The number of input registers is selected by a set of switches (not shown in Figure 2-100) between registers to implement single or differential data transmission to and from the FPGA core. The Designer software sets these switches for the user.

A common CLR/PRE signal is employed by all I/O registers when I/O register combining is used. Input register 2 does not have a CLR/PRE pin, as this register is used for DDR implementation. The I/O register combining must satisfy some rules.



Note: Fusion I/Os have registers to support DDR functionality (see the "Double Data Rate (DDR) Support" section on page 2-139 for more information).

Figure 2-100 • **I/O Block Logical Representation**

Table 2-96 • I/O Output Buffer Maximum Resistances [1] (continued)

Standard	Drive Strength	$R_{PULL\text{-}DOWN}$ (ohms) [2]	$R_{PULL\text{-}UP}$ (ohms) [3]
Applicable to Standard I/O Banks			
3.3 V LVTTL / 3.3 V LVCMOS	2 mA	100	300
	4 mA	100	300
	6 mA	50	150
	8 mA	50	150
2.5 V LVCMOS	2 mA	100	200
	4 mA	100	200
	6 mA	50	100
	8 mA	50	100
1.8 V LVCMOS	2 mA	200	225
	4 mA	100	112
1.5 V LVCMOS	2 mA	200	224

Notes:

1. *These maximum values are provided for informational reasons only. Minimum output buffer resistance values depend on VCC, drive strength selection, temperature, and process. For board design considerations and detailed output buffer resistances, use the corresponding IBIS models located on the Microsemi SoC Products Group website: http://www.microsemi.com/soc/techdocs/models/ibis.html.*
2. $R_{(PULL\text{-}DOWN\text{-}MAX)} = VOLspec / I_{OLspec}$
3. $R_{(PULL\text{-}UP\text{-}MAX)} = (VCCImax – VOHspec) / IOHspec$

Table 2-97 • I/O Weak Pull-Up/Pull-Down Resistances
Minimum and Maximum Weak Pull-Up/Pull-Down Resistance Values

VCCI	$R_{(WEAK\ PULL\text{-}UP)}$ [1] (ohms)		$R_{(WEAK\ PULL\text{-}DOWN)}$ [2] (ohms)	
	Min.	Max.	Min.	Max.
3.3 V	10 k	45 k	10 k	45 k
2.5 V	11 k	55 k	12 k	74 k
1.8 V	18 k	70 k	17 k	110 k
1.5 V	19 k	90 k	19 k	140 k

Notes:

1. $R_{(WEAK\ PULL\text{-}UP\text{-}MAX)} = (VCCImax – VOHspec) / I_{WEAK\ PULL\text{-}UP\text{-}MIN}$
2. $R_{(WEAK\ PULL\text{-}DOWN\text{-}MAX)} = VOLspec / I_{WEAK\ PULL\text{-}DOWN\text{-}MIN}$

Table 2-99 • Short Current Event Duration before Failure

Temperature	Time Before Failure
–40°C	>20 years
0°C	>20 years
25°C	>20 years
70°C	5 years
85°C	2 years
100°C	6 months

Table 2-100 • Schmitt Trigger Input Hysteresis
Hysteresis Voltage Value (typ.) for Schmitt Mode Input Buffers

Input Buffer Configuration	Hysteresis Value (typ.)
3.3 V LVTTL/LVCMOS/PCI/PCI-X (Schmitt trigger mode)	240 mV
2.5 V LVCMOS (Schmitt trigger mode)	140 mV
1.8 V LVCMOS (Schmitt trigger mode)	80 mV
1.5 V LVCMOS (Schmitt trigger mode)	60 mV

Table 2-101 • I/O Input Rise Time, Fall Time, and Related I/O Reliability

Input Buffer	Input Rise/Fall Time (min.)	Input Rise/Fall Time (max.)	Reliability
LVTTL/LVCMOS (Schmitt trigger disabled)	No requirement	10 ns*	20 years (100°C)
LVTTL/LVCMOS (Schmitt trigger enabled)	No requirement	No requirement, but input noise voltage cannot exceed Schmitt hysteresis	20 years (100°C)
HSTL/SSTL/GTL	No requirement	10 ns*	10 years (100°C)
LVDS/BLVDS/M-LVDS/LVPECL	No requirement	10 ns*	10 years (100°C)

*Note: * The maximum input rise/fall time is related only to the noise induced into the input buffer trace. If the noise is low, the rise time and fall time of input buffers, when Schmitt trigger is disabled, can be increased beyond the maximum value. The longer the rise/fall times, the more susceptible the input signal is to the board noise. Microsemi recommends signal integrity evaluation/characterization of the system to ensure there is no excessive noise coupling into input signals.*

Single-Ended I/O Characteristics

3.3 V LVTTL / 3.3 V LVCMOS

Low-Voltage Transistor–Transistor Logic is a general-purpose standard (EIA/JESD) for 3.3 V applications. It uses an LVTTL input buffer and push-pull output buffer. The 3.3 V LVCMOS standard is supported as part of the 3.3 V LVTTL support.

Table 2-102 • Minimum and Maximum DC Input and Output Levels

BLVDS/M-LVDS

Bus LVDS (BLVDS) and Multipoint LVDS (M-LVDS) specifications extend the existing LVDS standard to high-performance multipoint bus applications. Multidrop and multipoint bus configurations can contain any combination of drivers, receivers, and transceivers. Microsemi LVDS drivers provide the higher drive current required by BLVDS and M-LVDS to accommodate the loading. The driver requires series terminations for better signal quality and to control voltage swing. Termination is also required at both ends of the bus, since the driver can be located anywhere on the bus. These configurations can be implemented using TRIBUF_LVDS and BIBUF_LVDS macros along with appropriate terminations. Multipoint designs using Microsemi LVDS macros can achieve up to 200 MHz with a maximum of 20 loads. A sample application is given in Figure 2-135. The input and output buffer delays are available in the LVDS section in Table 2-171.

Example: For a bus consisting of 20 equidistant loads, the following terminations provide the required differential voltage, in worst-case industrial operating conditions at the farthest receiver: R_S = 60 Ω and R_T = 70 Ω, given Z_0 = 50 Ω (2") and Z_{stub} = 50 Ω (~1.5").

IEEE 1532 Characteristics

JTAG timing delays do not include JTAG I/Os. To obtain complete JTAG timing, add I/O buffer delays to the corresponding standard selected; refer to the I/O timing characteristics in the "User I/Os" section on page 2-132 for more details.

Timing Characteristics

Table 2-186 • JTAG 1532
Commercial Temperature Range Conditions: T_J = 70°C, Worst-Case VCC = 1.425 V

Parameter	Description	–2	–1	Std.	Units

$t_{TRSTMPW}$	ResetB Minimum Pulse	TBD	TBD	TBD	ns

Note: For the derating values at specific junction temperature and voltage supply levels, refer to Table 3-7 on page 3-9.

PLL/CCC Contribution—P_{PLL}

PLL is not used in this application.

P_{PLL} = 0 W

Nonvolatile Memory—P_{NVM}

Nonvolatile memory is not used in this application.

P_{NVM} = 0 W

Crystal Oscillator—$P_{XTL-OSC}$

The application utilizes standby mode. The crystal oscillator is assumed to be active.

Operating Mode

$P_{XTL-OSC}$ = PAC18

$P_{XTL-OSC}$ = 0.63 mW

Standby Mode

$P_{XTL-OSC}$ = PAC18

$P_{XTL-OSC}$ = 0.63 mW

Sleep Mode

$P_{XTL-OSC}$ = 0 W

RC Oscillator—P_{RC-OSC}

Operating Mode

P_{RC-OSC} = PAC19

P_{RC-OSC} = 3.30 mW

Standby Mode and Sleep Mode

P_{RC-OSC} = 0 W

Analog System—P_{AB}

Number of Quads used: N_{QUADS} = 4

Operating Mode

P_{AB} = PAC20

P_{AB} = 3.00 mW

Standby Mode and Sleep Mode

P_{AB} = 0 W

Total Dynamic Power Consumption—P_{DYN}

Operating Mode

$P_{DYN} = P_{CLOCK} + P_{S-CELL} + P_{C-CELL} + P_{NET} + P_{INPUTS} + P_{OUTPUTS} + P_{MEMORY} + P_{PLL} + P_{NVM} + P_{XTL-OSC} + P_{RC-OSC} + P_{AB}$

P_{DYN} = 41.28 mW + 21.1 mW + 4.35 mW + 19.25 mW + 1.30 mW + 47.47 mW + 1.38 mW + 0 + 0 + 0.63 mW + 3.30 mW + 3.00 mW

P_{DYN} = 143.06 mW

Standby Mode

$P_{DYN} = P_{XTL-OSC}$

P_{DYN} = 0.63 mW

Sleep Mode

P_{DYN} = 0 W

Revision	Changes	Page
v2.0, Revision 1 (continued)	Table 3-6 • Package Thermal Resistance was updated to include new data.	3-7
	In EQ 4 to EQ 6, the junction temperature was changed from 110°C to 100°C.	3-8 to 3-8
	Table 3-8 • AFS1500 Quiescent Supply Current Characteristics through Table 3-11 • AFS090 Quiescent Supply Current Characteristics are new and have replaced the Quiescent Supply Current Characteristics (IDDQ) table.	3-10 to 3-16
	In Table 3-14 • Different Components Contributing to the Dynamic Power Consumption in Fusion Devices, the power supply for PAC9 and PAC10 were changed from VMV/VCC to VCCI.	3-22
	In Table 3-15 • Different Components Contributing to the Static Power Consumption in Fusion Devices, the power supply for PDC7 and PDC8 were changed from VMV/VCC to VCCI. PDC1 was updated from TBD to 18.	3-23
	The "QN108" table was updated to remove the duplicates of pins B12 and B34.	4-2
Preliminary v1.7 (October 2008)	The version number category was changed from Advance to Preliminary, which means the datasheet contains information based on simulation and/or initial characterization. The information is believed to be correct, but changes are possible.	
	For the VIL and VIH parameters, 0.30 * VCCI was changed to 0.35 * VCCI and 0.70 * VCCI was changed to 0.65 * VCCI in Table 2-126 • Minimum and Maximum DC Input and Output Levels.	2-193
	The version number category was changed from Advance to Preliminary, which means the datasheet contains information based on simulation and/or initial characterization. The information is believed to be correct, but changes are possible.	N/A
	The following updates were made to Table 2-141 • Minimum and Maximum DC Input and Output Levels: Temperature Digital Output 213 00 1111 1101 283 01 0001 1011 358 01 0110 0110 – only the digital output was updated. Temperature 358 remains in the temperature column.	2-200
	In Advance v1.2, the "VAREF Analog Reference Voltage" pin description was significantly updated but the change was not noted in the change table.	2-225
Advance v1.6 (August 2008)	The title of the datasheet changed from Actel Programmable System Chips to Actel Fusion Mixed Signal FPGAs. In addition, all instances of programmable system chip were changed to mixed signal FPGA.	N/A
	The references to the *Peripherals User's Guide* in the "No-Glitch MUX (NGMUX)" section and "Voltage Regulator Power Supply Monitor (VRPSM)" section were changed to *Fusion Handbook*.	2-32, 2-42
Advance v1.5 (July 2008)	The following bullet was updated from High-Voltage Input Tolerance: ±12 V to High-Voltage Input Tolerance: 10.5 V to 12 V.	I
	The following bullet was updated from Programmable 1, 3, 10, 30 µA and 25 mA Drive Strengths to Programmable 1, 3, 10, 30 µA and 20 mA Drive Strengths.	I
