Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details

Product Status	Active
Number of LABs/CLBs	-
Number of Logic Elements/Cells	-
Total RAM Bits	276480
Number of I/O	119
Number of Gates	1500000
Voltage - Supply	1.425V ~ 1.575V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	256-LBGA
Supplier Device Package	256-FPBGA (17x17)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/afs1500-fgg256i

Timing Characteristics

Table 2-1 • Combinatorial Cell Propagation Delays
Commercial Temperature Range Conditions: $T_J = 70^\circ\text{C}$, Worst-Case $V_{CC} = 1.425\text{ V}$

Combinatorial Cell	Equation	Parameter	-2	-1	Std.	Units
INV	$Y = !A$	t_{PD}	0.40	0.46	0.54	ns
AND2	$Y = A \cdot B$	t_{PD}	0.47	0.54	0.63	ns
NAND2	$Y = !(A \cdot B)$	t_{PD}	0.47	0.54	0.63	ns
OR2	$Y = A + B$	t_{PD}	0.49	0.55	0.65	ns
NOR2	$Y = !(A + B)$	t_{PD}	0.49	0.55	0.65	ns
XOR2	$Y = A \oplus B$	t_{PD}	0.74	0.84	0.99	ns
MAJ3	$Y = \text{MAJ}(A, B, C)$	t_{PD}	0.70	0.79	0.93	ns
XOR3	$Y = A \oplus B \oplus C$	t_{PD}	0.87	1.00	1.17	ns
MUX2	$Y = A \text{ IS } + B \text{ S}$	t_{PD}	0.51	0.58	0.68	ns
AND3	$Y = A \cdot B \cdot C$	t_{PD}	0.56	0.64	0.75	ns

Note: For the derating values at specific junction temperature and voltage supply levels, refer to [Table 3-7](#) on [page 3-9](#).

Sample VersaTile Specifications—Sequential Module

The Fusion library offers a wide variety of sequential cells, including flip-flops and latches. Each has a data input and optional enable, clear, or preset. In this section, timing characteristics are presented for a representative sample from the library ([Figure 2-5](#)). For more details, refer to the *IGLOO*, *ProASIC3*, *SmartFusion* and *Fusion Macro Library Guide*.

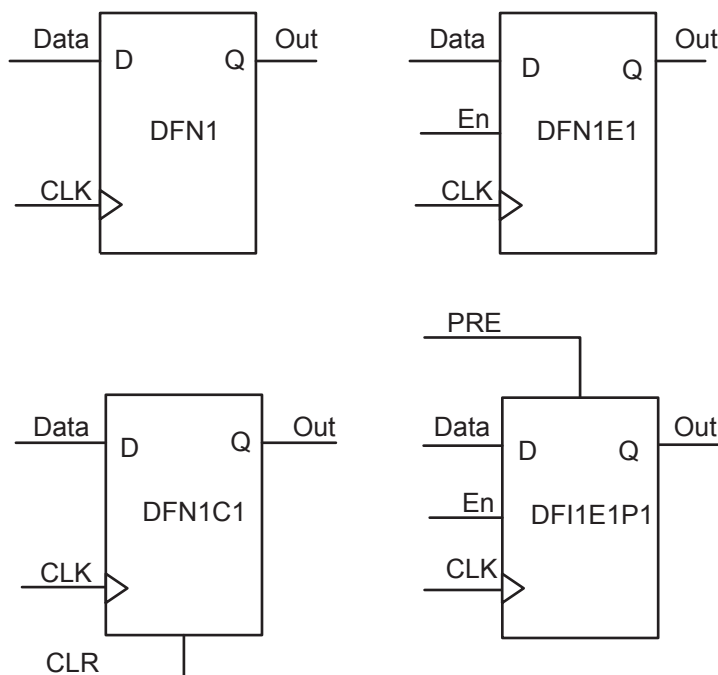

Figure 2-5 • Sample of Sequential Cells

Table 2-7 • AFS250 Global Resource Timing
Commercial Temperature Range Conditions: $T_J = 70^\circ\text{C}$, Worst-Case $V_{CC} = 1.425\text{ V}$

Parameter	Description	–2		–1		Std.		Units
		Min. ¹	Max. ²	Min. ¹	Max. ²	Min. ¹	Max. ²	
t_{RCKL}	Input Low Delay for Global Clock	0.89	1.12	1.02	1.27	1.20	1.50	ns
t_{RCKH}	Input High Delay for Global Clock	0.88	1.14	1.00	1.30	1.17	1.53	ns
$t_{RCKMPWH}$	Minimum Pulse Width High for Global Clock							ns
$t_{RCKMPWL}$	Minimum Pulse Width Low for Global Clock							ns
t_{RCKSW}	Maximum Skew for Global Clock		0.26		0.30		0.35	ns

Notes:

1. Value reflects minimum load. The delay is measured from the CCC output to the clock pin of a sequential element located in a lightly loaded row (single element is connected to the global net).
2. Value reflects maximum load. The delay is measured on the clock pin of the farthest sequential element located in a fully loaded row (all available flip-flops are connected to the global net in the row).
3. For the derating values at specific junction temperature and voltage supply levels, refer to [Table 3-7 on page 3-9](#).

Table 2-8 • AFS090 Global Resource Timing
Commercial Temperature Range Conditions: $T_J = 70^\circ\text{C}$, Worst-Case $V_{CC} = 1.425\text{ V}$

Parameter	Description	–2		–1		Std.		Units
		Min. ¹	Max. ²	Min. ¹	Max. ²	Min. ¹	Max. ²	
t_{RCKL}	Input Low Delay for Global Clock	0.84	1.07	0.96	1.21	1.13	1.43	ns
t_{RCKH}	Input High Delay for Global Clock	0.83	1.10	0.95	1.25	1.12	1.47	ns
$t_{RCKMPWH}$	Minimum Pulse Width High for Global Clock							ns
$t_{RCKMPWL}$	Minimum Pulse Width Low for Global Clock							ns
t_{RCKSW}	Maximum Skew for Global Clock		0.27		0.30		0.36	ns

Notes:

1. Value reflects minimum load. The delay is measured from the CCC output to the clock pin of a sequential element located in a lightly loaded row (single element is connected to the global net).
2. Value reflects maximum load. The delay is measured on the clock pin of the farthest sequential element located in a fully loaded row (all available flip-flops are connected to the global net in the row).
3. For the derating values at specific junction temperature and voltage supply levels, refer to [Table 3-7 on page 3-9](#).

CCC and PLL Characteristics

Timing Characteristics

Table 2-12 • Fusion CCC/PLL Specification

Parameter	Min.	Typ.	Max.	Unit
Clock Conditioning Circuitry Input Frequency f_{IN_CCC}	1.5		350	MHz
Clock Conditioning Circuitry Output Frequency f_{OUT_CCC}	0.75		350	MHz
Delay Increments in Programmable Delay Blocks ^{1, 2}		160 ³		ps
Number of Programmable Values in Each Programmable Delay Block			32	
Input Period Jitter			1.5	ns
CCC Output Peak-to-Peak Period Jitter F_{CCC_OUT}	Max Peak-to-Peak Period Jitter			
	1 Global Network Used		3 Global Networks Used	
0.75 MHz to 24 MHz	1.00%		1.00%	
24 MHz to 100 MHz	1.50%		1.50%	
100 MHz to 250 MHz	2.25%		2.25%	
250 MHz to 350 MHz	3.50%		3.50%	
Acquisition Time	LockControl = 0		300	μs
	LockControl = 1		6.0	ms
Tracking Jitter ⁴	LockControl = 0		1.6	ns
	LockControl = 1		0.8	ns
Output Duty Cycle	48.5		51.5	%
Delay Range in Block: Programmable Delay 1 ^{1, 2}	0.6		5.56	ns
Delay Range in Block: Programmable Delay 2 ^{1, 2}	0.025		5.56	ns
Delay Range in Block: Fixed Delay ^{1, 2}		2.2		ns

Notes:

1. This delay is a function of voltage and temperature. See [Table 3-7 on page 3-9](#) for deratings.
2. $T_J = 25^\circ\text{C}$, $V_{CC} = 1.5\text{ V}$
3. When the CCC/PLL core is generated by Microsemi core generator software, not all delay values of the specified delay increments are available. Refer to the Libero SoC Online Help associated with the core for more information.
4. Tracking jitter is defined as the variation in clock edge position of PLL outputs with reference to PLL input clock edge. Tracking jitter does not measure the variation in PLL output period, which is covered by period jitter parameter.

The following signals are used to configure the FIFO4K18 memory element.

WW and RW

These signals enable the FIFO to be configured in one of the five allowable aspect ratios ([Table 2-33](#)).

Table 2-33 • Aspect Ratio Settings for WW[2:0]

WW2, WW1, WW0	RW2, RW1, RW0	D×W
000	000	4k×1
001	001	2k×2
010	010	1k×4
011	011	512×9
100	100	256×18
101, 110, 111	101, 110, 111	Reserved

WBLK and RBLK

These signals are active low and will enable the respective ports when Low. When the RBLK signal is High, the corresponding port's outputs hold the previous value.

WEN and REN

Read and write enables. WEN is active low and REN is active high by default. These signals can be configured as active high or low.

WCLK and RCLK

These are the clock signals for the synchronous read and write operations. These can be driven independently or with the same driver.

RPIPE

This signal is used to specify pipelined read on the output. A Low on RPIPE indicates a nonpipelined read, and the data appears on the output in the same clock cycle. A High indicates a pipelined read, and data appears on the output in the next clock cycle.

RESET

This active low signal resets the output to zero when asserted. It resets the FIFO counters. It also sets all the RD pins Low, the FULL and AFULL pins Low, and the EMPTY and AEMPTY pins High ([Table 2-34](#)).

Table 2-34 • Input Data Signal Usage for Different Aspect Ratios

D×W	WD/RD Unused
4k×1	WD[17:1], RD[17:1]
2k×2	WD[17:2], RD[17:2]
1k×4	WD[17:4], RD[17:4]
512×9	WD[17:9], RD[17:9]
256×18	—

WD

This is the input data bus and is 18 bits wide. Not all 18 bits are valid in all configurations. When a data width less than 18 is specified, unused higher-order signals must be grounded ([Table 2-34](#)).

RD

This is the output data bus and is 18 bits wide. Not all 18 bits are valid in all configurations. Like the WD bus, high-order bits become unusable if the data width is less than 18. The output data on unused pins is undefined ([Table 2-34](#)).

The AEMPTY flag is asserted when the difference between the write address and the read address is less than a predefined value. In the example above, a value of 200 for AEVAL means that the AEMPTY flag will be asserted when a read causes the difference between the write address and the read address to drop to 200. It will stay asserted until that difference rises above 200. Note that the FIFO can be configured with different read and write widths; in this case, the AFVAL setting is based on the number of write data entries and the AEVAL setting is based on the number of read data entries. For aspect ratios of 512×9 and 256×18, only 4,096 bits can be addressed by the 12 bits of AFVAL and AEVAL. The number of words must be multiplied by 8 and 16, instead of 9 and 18. The SmartGen tool automatically uses the proper values. To avoid halfwords being written or read, which could happen if different read and write aspect ratios are specified, the FIFO will assert FULL or EMPTY as soon as at least a minimum of one word cannot be written or read. For example, if a two-bit word is written and a four-bit word is being read, the FIFO will remain in the empty state when the first word is written. This occurs even if the FIFO is not completely empty, because in this case, a complete word cannot be read. The same is applicable in the full state. If a four-bit word is written and a two-bit word is read, the FIFO is full and one word is read. The FULL flag will remain asserted because a complete word cannot be written at this point.

ADC Interface Timing

Table 2-48 • ADC Interface Timing
 Commercial Temperature Range Conditions: $T_J = 70^{\circ}\text{C}$, Worst-Case $V_{CC} = 1.425\text{ V}$

Parameter	Description	-2	-1	Std.	Units

Analog Configuration MUX

The ACM is the interface between the FPGA, the Analog Block configurations, and the real-time counter. Microsemi Libero SoC will generate IP that will load and configure the Analog Block via the ACM. However, users are not limited to using the Libero SoC IP. This section provides a detailed description of the ACM's register map, truth tables for proper configuration of the Analog Block and RTC, as well as timing waveforms so users can access and control the ACM directly from their designs.

The Analog Block contains four 8-bit latches per Analog Quad that are initialized through the ACM. These latches act as configuration bits for Analog Quads. The ACM block runs from the core voltage supply (1.5 V).

Access to the ACM is achieved via 8-bit address and data busses with enables. The pin list is provided in [Table 2-36 on page 2-78](#). The ACM clock speed is limited to a maximum of 10 MHz, more than sufficient to handle the low-bandwidth requirements of configuring the Analog Block and the RTC (sub-block of the Analog Block).

[Table 2-54](#) decodes the ACM address space and maps it to the corresponding Analog Quad and configuration byte for that quad.

Table 2-54 • ACM Address Decode Table for Analog Quad

ACMADDR [7:0] in Decimal	Name	Description	Associated Peripheral
0	—	—	Analog Quad
1	AQ0	Byte 0	Analog Quad

65	COUNTER1	Counter bits 15:8	RTC
66	COUNTER2	Counter bits 23:16	RTC
67	COUNTER3	Counter bits 31:24	RTC
68	COUNTER4	Counter bits 39:32	RTC
72	MATCHREG0	Match register bits 7:0	RTC

I/O Registers

Each I/O module contains several input, output, and enable registers. Refer to Figure 2-100 for a simplified representation of the I/O block.

The number of input registers is selected by a set of switches (not shown in Figure 2-100) between registers to implement single or differential data transmission to and from the FPGA core. The Designer software sets these switches for the user.

A common CLR/PRE signal is employed by all I/O registers when I/O register combining is used. Input register 2 does not have a CLR/PRE pin, as this register is used for DDR implementation. The I/O register combining must satisfy some rules.

Note: Fusion I/Os have registers to support DDR functionality (see the "Double Data Rate (DDR) Support" section on page 2-139 for more information).

Figure 2-100 • I/O Block Logical Representation

Table 2-83 • Fusion Pro I/O Supported Standards and Corresponding VREF and VTT Voltages

I/O Standard	Input/Output Supply Voltage (VCCI_TYP)	Input Reference Voltage (VREF_TYP)	Board Termination Voltage (VTT_TYP)

Voltage Referenced I/O Characteristics

3.3 V GTL

Gunning Transceiver Logic is a high-speed bus standard (JESD8-3). It provides a differential amplifier input buffer and an open-drain output buffer. The VCCI pin should be connected to 3.3 V.

Table 2-138 • Minimum and Maximum DC Input and Output Levels

3.3 V GTL	VIL		VIH		VOL	VOH	IOL	IOH	IOSL	IOSH	IIL ¹	IIH ²
Drive Strength	Min. V	Max. V	Min. V	Max. V	Max. V	Min. V	mA	mA	Max. mA ³	Max. mA ³	μA ⁴	μA ⁴
20 mA ³	−0.3	VREF − 0.05	VREF + 0.05	3.6	0.4	−	20	20	181	268	10	10

Notes:

1. IIL is the input leakage current per I/O pin over recommended operation conditions where $-0.3\text{ V} < V_{IN} < V_{IL}$.
2. IIH is the input leakage current per I/O pin over recommended operating conditions $V_{IH} < V_{IN} < V_{CCI}$. Input current is larger when operating outside recommended ranges.
3. Currents are measured at high temperature (100°C junction temperature) and maximum voltage.
4. Currents are measured at 85°C junction temperature.

Figure 2-124 • AC Loading

Table 2-139 • AC Waveforms, Measuring Points, and Capacitive Loads

Input Low (V)	Input High (V)	Measuring Point* (V)	VREF (typ.) (V)	VTT (typ.) (V)	C _{LOAD} (pF)
VREF − 0.05	VREF + 0.05	0.8	0.8	1.2	10

Note: *Measuring point = Vtrip. See [Table 2-90 on page 2-166](#) for a complete table of trip points.

Timing Characteristics

Table 2-140 • 3.3 V GTL

Commercial Temperature Range Conditions: T_J = 70°C, Worst-Case VCC = 1.425 V, Worst-Case VCCI = 3.0 V, VREF = 0.8 V

User-Defined Supply Pins

VREF I/O Voltage Reference

Reference voltage for I/O minibanks. Both AFS600 and AFS1500 (north bank only) support Microsemi Pro I/O. These I/O banks support voltage reference standard I/O. The VREF pins are configured by the user from regular I/Os, and any I/O in a bank, except JTAG I/Os, can be designated as the voltage reference I/O. Only certain I/O standards require a voltage reference—HSTL (I) and (II), SSTL2 (I) and (II), SSTL3 (I) and (II), and GTL/GTL+. One VREF pin can support the number of I/Os available in its minibank.

VAREF Analog Reference Voltage

The Fusion device can be configured to generate a 2.56 V internal reference voltage that can be used by the ADC. While using the internal reference, the reference voltage is output on the VAREF pin for use as a system reference. If a different reference voltage is required, it can be supplied by an external source and applied to this pin. The valid range of values that can be supplied to the ADC is 1.0 V to 3.3 V. When VAREF is internally generated by the Fusion device, a bypass capacitor must be connected from this pin to ground. The value of the bypass capacitor should be between 3.3 μ F and 22 μ F, which is based on the needs of the individual designs. The choice of the capacitor value has an impact on the settling time it takes the VAREF signal to reach the required specification of 2.56 V to initiate valid conversions by the ADC. If the lower capacitor value is chosen, the settling time required for VAREF to achieve 2.56 V will be shorter than when selecting the larger capacitor value. The above range of capacitor values supports the accuracy specification of the ADC, which is detailed in the datasheet. Designers choosing the smaller capacitor value will not obtain as much margin in the accuracy as that achieved with a larger capacitor value. Depending on the capacitor value selected in the Analog System Builder, a tool in Libero SoC, an automatic delay circuit will be generated using logic tiles available within the FPGA to ensure that VAREF has achieved the 2.56 V value. Microsemi recommends customers use 10 μ F as the value of the bypass capacitor. Designers choosing to use an external VAREF need to ensure that a stable and clean VAREF source is supplied to the VAREF pin before initiating conversions by the ADC. Designers should also make sure that the ADCRESET signal is deasserted before initiating valid conversions.²

If the user connects VAREF to external 3.3 V on their board, the internal VAREF driving OpAmp tries to bring the pin down to the nominal 2.56 V until the device is programmed and up/functional. Under this scenario, it is recommended to connect an external 3.3 V supply through a ~1 K Ω resistor to limit current, along with placing a 10-100nF capacitor between VAREF and GNDA.

User Pins

I/O User Input/Output

The I/O pin functions as an input, output, tristate, or bidirectional buffer. Input and output signal levels are compatible with the I/O standard selected. Unused I/O pins are configured as inputs with pull-up resistors.

During programming, I/Os become tristated and weakly pulled up to VCCI. With the VCCI and VCC supplies continuously powered up, when the device transitions from programming to operating mode, the I/Os get instantly configured to the desired user configuration.

Unused I/Os are configured as follows:

- Output buffer is disabled (with tristate value of high impedance)
- Input buffer is disabled (with tristate value of high impedance)
- Weak pull-up is programmed

Axy Analog Input/Output

Analog I/O pin, where x is the analog pad type (C = current pad, G = Gate driver pad, T = Temperature pad, V = Voltage pad) and y is the Analog Quad number (0 to 9). There is a minimum 1 M Ω to ground on AV, AC, and AT. This pin can be left floating when it is unused.

2. The ADC is functional with an external reference down to 1V, however to meet the performance parameters highlighted in the datasheet refer to the VAREF specification in [Table 3-2 on page 3-3](#).

TMS Test Mode Select

The TMS pin controls the use of the IEEE1532 boundary scan pins (TCK, TDI, TDO, TRST). There is an internal weak pull-up resistor on the TMS pin.

TRST Boundary Scan Reset Pin

The TRST pin functions as an active low input to asynchronously initialize (or reset) the boundary scan circuitry. There is an internal weak pull-up resistor on the TRST pin. If JTAG is not used, an external pull-down resistor could be included to ensure the TAP is held in reset mode. The resistor values must be chosen from [Table 2-183](#) and must satisfy the parallel resistance value requirement. The values in [Table 2-183](#) correspond to the resistor recommended when a single device is used and to the equivalent parallel resistor when multiple devices are connected via a JTAG chain.

In critical applications, an upset in the JTAG circuit could allow entering an undesired JTAG state. In such cases, Microsemi recommends tying off TRST to GND through a resistor placed close to the FPGA pin.

Note that to operate at all VJTAG voltages, 500 Ω to 1 k Ω will satisfy the requirements.

Special Function Pins

NC No Connect

This pin is not connected to circuitry within the device. These pins can be driven to any voltage or can be left floating with no effect on the operation of the device.

DC Don't Connect

This pin should not be connected to any signals on the PCB. These pins should be left unconnected.

NCAP Negative Capacitor

Negative Capacitor is where the negative terminal of the charge pump capacitor is connected. A capacitor, with a 2.2 μ F recommended value, is required to connect between PCAP and NCAP.

PCAP Positive Capacitor

Positive Capacitor is where the positive terminal of the charge pump capacitor is connected. A capacitor, with a 2.2 μ F recommended value, is required to connect between PCAP and NCAP.

PUB Push Button

Push button is the connection for the external momentary switch used to turn on the 1.5 V voltage regulator and can be floating if not used.

PTBASE Pass Transistor Base

Pass Transistor Base is the control signal of the voltage regulator. This pin should be connected to the base of the external pass transistor used with the 1.5 V internal voltage regulator and can be floating if not used.

PTEM Pass Transistor Emitter

Pass Transistor Emitter is the feedback input of the voltage regulator.

This pin should be connected to the emitter of the external pass transistor used with the 1.5 V internal voltage regulator and can be floating if not used.

XTAL1 Crystal Oscillator Circuit Input

Input to crystal oscillator circuit. Pin for connecting external crystal, ceramic resonator, RC network, or external clock input. When using an external crystal or ceramic oscillator, external capacitors are also recommended (Please refer to the crystal oscillator manufacturer for proper capacitor value).

If using external RC network or clock input, XTAL1 should be used and XTAL2 left unconnected. In the case where the Crystal Oscillator block is not used, the XTAL1 pin should be connected to GND and the XTAL2 pin should be left floating.

Table 3-9 • AFS600 Quiescent Supply Current Characteristics

Parameter	Description	Conditions	Temp.	Min	Typ	Max	Unit
ICC ¹	1.5 V quiescent current	Operational standby ⁴ , VCC = 1.575 V	T _J = 25°C		13	25	mA
			T _J = 85°C		20	45	mA
			T _J = 100°C		25	75	mA
		Standby mode ⁵ or Sleep mode ⁶ , VCC = 0 V			0	0	μA
ICC33 ²	3.3 V analog supplies current	Operational standby ⁴ , VCC33 = 3.63 V	T _J = 25°C		9.8	13	mA
			T _J = 85°C		10.7	14	mA
			T _J = 100°C		10.8	15	mA
		Operational standby, only Analog Quad and –3.3 V output ON, VCC33 = 3.63 V	T _J = 25°C		0.31	2	mA
			T _J = 85°C		0.35	2	mA
			T _J = 100°C		0.45	2	mA
		Standby mode ⁵ , VCC33 = 3.63 V	T _J = 25°C		2.8	3.6	mA
			T _J = 85°C		2.9	4	mA
			T _J = 100°C		3.5	6	mA
		Sleep mode ⁶ , VCC33 = 3.63 V	T _J = 25°C		17	19	μA
			T _J = 85°C		18	20	μA
			T _J = 100°C		24	25	μA
ICCI ³	I/O quiescent current	Operational standby ⁴ , VCCIX = 3.63 V	T _J = 25°C		417	648	μA
			T _J = 85°C		417	648	μA
			T _J = 100°C		417	649	μA
IJTAG	JTAG I/O quiescent current	Operational standby ⁴ , VJTAG = 3.63 V	T _J = 25°C		80	100	μA
			T _J = 85°C		80	100	μA
			T _J = 100°C		80	100	μA
		Standby mode ⁵ or Sleep mode ⁶ , VJTAG = 0 V			0	0	μA

Notes:

1. ICC is the 1.5 V power supplies, ICC and ICC15A.
2. ICC33A includes ICC33A, ICC33PMP, and ICCOSC.
3. ICCI includes all ICCI0, ICCI1, ICCI2, and ICCI4.
4. Operational standby is when the Fusion device is powered up, all blocks are used, no I/O is toggling, Voltage Regulator is loaded with 200 mA, VCC33PMP is ON, XTAL is ON, and ADC is ON.
5. XTAL is configured as high gain, VCC = VJTAG = VPUMP = 0 V.
6. Sleep Mode, VCC = VJTAG = VPUMP = 0 V.
