
Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Active
Number of LABs/CLBs	-
Number of Logic Elements/Cells	-
Total RAM Bits	110592
Number of I/O	172
Number of Gates	600000
Voltage - Supply	1.425V ~ 1.575V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	484-BGA
Supplier Device Package	484-FPBGA (23x23)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/afs600-2fg484

Table of Contents

Clock Conditioning Circuits

In Fusion devices, the CCCs are used to implement frequency division, frequency multiplication, phase shifting, and delay operations.

The CCCs are available in six chip locations—each of the four chip corners and the middle of the east and west chip sides.

Each CCC can implement up to three independent global buffers (with or without programmable delay), or a PLL function (programmable frequency division/multiplication, phase shift, and delays) with up to three global outputs. Unused global outputs of a PLL can be used to implement independent global buffers, up to a maximum of three global outputs for a given CCC.

A global buffer can be placed in any of the three global locations (CLKA-GLA, CLKB-GLB, and CLKC-GLC) of a given CCC.

A PLL macro uses the CLKA CCC input to drive its reference clock. It uses the GLA and, optionally, the GLB and GLC global outputs to drive the global networks. A PLL macro can also drive the YB and YC regular core outputs. The GLB (or GLC) global output cannot be reused if the YB (or YC) output is used (Figure 2-19). Refer to the "PLL Macro" section on page 2-27 for more information.

Each global buffer, as well as the PLL reference clock, can be driven from one of the following:

- 3 dedicated single-ended I/Os using a hardwired connection
- 2 dedicated differential I/Os using a hardwired connection
- The FPGA core

The CCC block is fully configurable, either via flash configuration bits set in the programming bitstream or through an asynchronous interface. This asynchronous interface is dynamically accessible from inside the Fusion device to permit changes of parameters (such as divide ratios) during device operation. To increase the versatility and flexibility of the clock conditioning system, the CCC configuration is determined either by the user during the design process, with configuration data being stored in flash memory as part of the device programming procedure, or by writing data into a dedicated shift register during normal device operation. This latter mode allows the user to dynamically reconfigure the CCC without the need for core programming. The shift register is accessed through a simple serial interface. Refer to the "UJTAG Applications in Microsemi's Low-Power Flash Devices" chapter of the *Fusion FPGA Fabric User Guide* and the "CCC and PLL Characteristics" section on page 2-28 for more information.

Read Operation

Read operations are designed to read data from the FB Array, Page Buffer, Block Buffer, or status registers. Read operations support a normal read and a read-ahead mode (done by asserting READNEXT). Also, the timing for Read operations is dependent on the setting of PIPE.

The following diagrams illustrate representative timing for Non-Pipe Mode (Figure 2-38) and Pipe Mode (Figure 2-39) reads of the flash memory block interface.

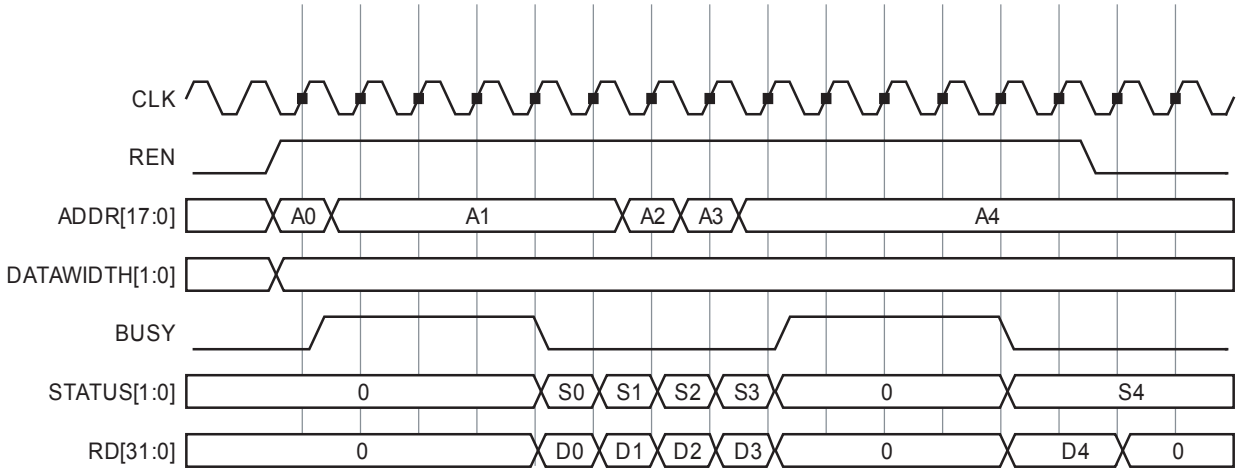

Figure 2-38 • **Read Waveform (Non-Pipe Mode, 32-bit access)**

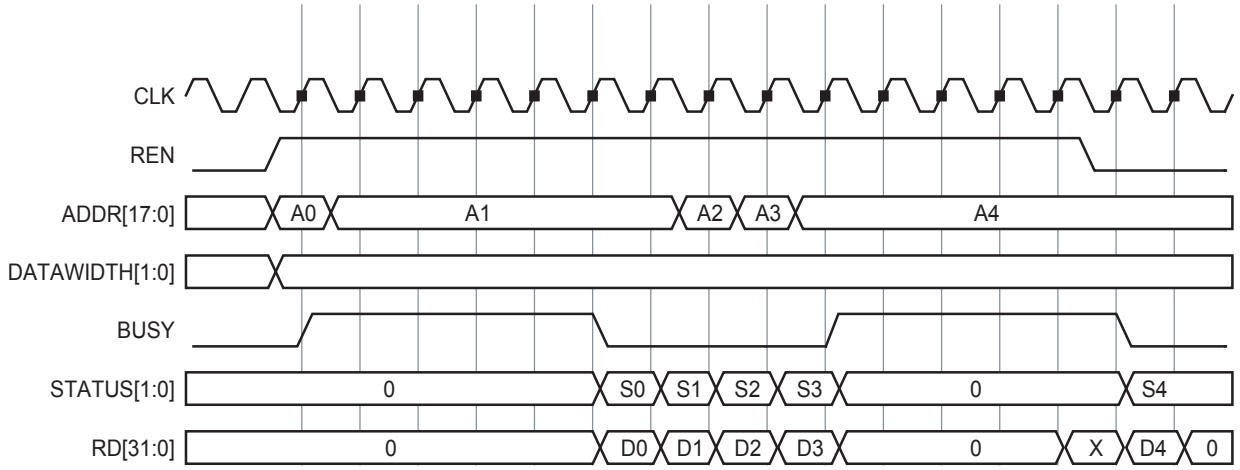

Figure 2-39 • **Read Waveform (Pipe Mode, 32-bit access)**

Flash Memory Block Characteristics

The following signals are used to configure the RAM4K9 memory element.

WIDTHA and WIDTHB

These signals enable the RAM to be configured in one of four allowable aspect ratios (Table 2-27).

Table 2-27 • Allowable Aspect Ratio Settings for WIDTHA[1:0]

WIDTHA1, WIDTHA0	WIDTHB1, WIDTHB0	D×W
00	00	4k×1
01	01	2k×2
10	10	1k×4
11	11	512×9
Note: The aspect ratio settings are constant and cannot be changed on the fly.		

BLKA and BLKB

These signals are active low and will enable the respective ports when asserted. When a BLKx signal is deasserted, the corresponding port's outputs hold the previous value.

WENA and WENB

These signals switch the RAM between read and write mode for the respective ports. A Low on these signals indicates a write operation, and a High indicates a read.

CLKA and CLKB

These are the clock signals for the synchronous read and write operations. These can be driven independently or with the same driver.

PIPEA and PIPEB

These signals are used to specify pipelined read on the output. A Low on PIPEA or PIPEB indicates a nonpipelined read, and the data appears on the corresponding output in the same clock cycle. A High indicates a pipelined, read and data appears on the corresponding output in the next clock cycle.

WMODEA and WMODEB

These signals are used to configure the behavior of the output when the RAM is in write mode. A Low on these signals makes the output retain data from the previous read. A High indicates pass-through behavior, wherein the data being written will appear immediately on the output. This signal is overridden when the RAM is being read.

RESET

This active low signal resets the output to zero, disables reads and writes from the SRAM block, and clears the data hold registers when asserted. It does not reset the contents of the memory.

ADDRA and ADDRB

These are used as read or write addresses, and they are 12 bits wide. When a depth of less than 4 k is specified, the unused high-order bits must be grounded (Table 2-28).

Table 2-28 • Address Pins Unused/Used for Various Supported Bus Widths

D×W	ADDRx	
	Unused	Used
4k×1	None	[11:0]
2k×2	[11]	[10:0]
1k×4	[11:10]	[9:0]
512×9	[11:9]	[8:0]

Note: The "x" in ADDRx implies A or B.

Typical scaling factors are given in Table 2-57 on page 2-130, and the gain error (which contributes to the minimum and maximum) is in Table 2-49 on page 2-117.

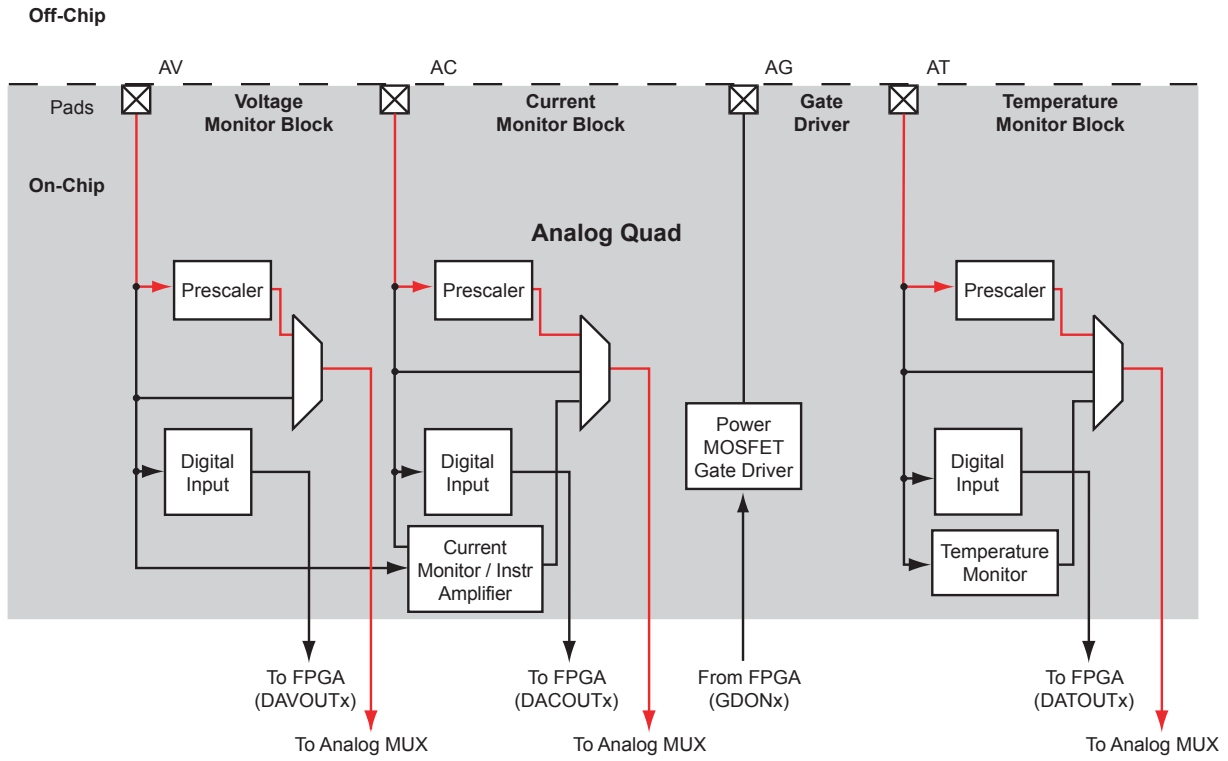

Figure 2-67 • **Analog Quad Prescaler Input Configuration**

Terminology

BW – Bandwidth

BW is a range of frequencies that a Channel can handle.

Channel

A channel is define as an analog input configured as one of the Prescaler range shown in Table 2-57 on page 2-130. The channel includes the Prescaler circuit and the ADC.

Channel Gain

Channel Gain is a measured of the deviation of the actual slope from the ideal slope. The slope is measured from the 20% and 80% point.

$$\text{Gain} = \frac{\text{Gain}_{\text{actual}}}{\text{Gain}_{\text{ideal}}}$$

EQ 1

Channel Gain Error

Channel Gain Error is a deviation from the ideal slope of the transfer function. The Prescaler Gain Error is expressed as the percent difference between the actual and ideal, as shown in EQ 2.

$$\text{Error}_{\text{Gain}} = (1\text{-Gain}) \times 100\%$$

EQ 2

Integrated Voltage Reference

The Fusion device has an integrated on-chip 2.56 V reference voltage for the ADC. The value of this reference voltage was chosen to make the prescaling and postscaling factors for the prescaler blocks change in a binary fashion. However, if desired, an external reference voltage of up to 3.3 V can be connected between the VAREF and ADCGNDREF pins. The VAREFSEL control pin is used to select the reference voltage.

Table 2-42 • VAREF Bit Function

Name	Bit	Function
VAREF	0	Reference voltage selection 0 – Internal voltage reference selected. VAREF pin outputs 2.56 V. 1 – Input external voltage reference from VAREF and ADCGNDREF

ADC Clock

The speed of the ADC depends on its internal clock, ADCCLK, which is not accessible to users. The ADCCLK is derived from SYSCLK. Input signal TVC[7:0], Time Divider Control, determines the speed of the ADCCLK in relationship to SYSCLK, based on EQ 15.

$$t_{ADCCLK} = 4 \times (1 + TVC) \times t_{SYSCLK}$$

EQ 15

TVC: Time Divider Control (0–255)

t_{ADCCLK} is the period of ADCCLK, and must be between 0.5 MHz and 10 MHz

t_{SYSCLK} is the period of SYSCLK

Table 2-43 • TVC Bits Function

Name	Bits	Function
TVC	[7:0]	SYSCLK divider control

The frequency of ADCCLK, f_{ADCCLK}, must be within 0.5 Hz to 10 MHz.

The inputs to the ADC are synchronized to SYSCLK. A conversion is initiated by asserting the ADCSTART signal on a rising edge of SYSCLK. Figure 2-90 on page 2-112 and Figure 2-91 on page 2-112 show the timing diagram for the ADC.

Acquisition Time or Sample Time Control

Acquisition time (t_{SAMPLE}) specifies how long an analog input signal has to charge the internal capacitor array. Figure 2-88 shows a simplified internal input sampling mechanism of a SAR ADC.

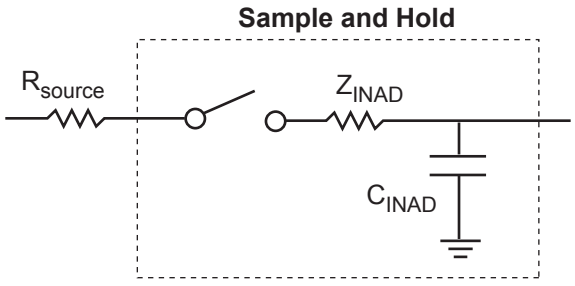

Figure 2-88 • Simplified Sample and Hold Circuitry

The internal impedance (Z_{INAD}), external source resistance (R_{SOURCE}), and sample capacitor (C_{INAD}) form a simple RC network. As a result, the accuracy of the ADC can be affected if the ADC is given insufficient time to charge the capacitor. To resolve this problem, you can either reduce the source resistance or increase the sampling time by changing the acquisition time using the STC signal.

Table 2-49 • Analog Channel Specifications (continued)
Commercial Temperature Range Conditions, T_J = 85°C (unless noted otherwise), Typical: VCC33A = 3.3 V, VCC = 1.5 V

Parameter	Description	Condition	Min.	Typ.	Max.	Units
Temperature Monitor Using Analog Pad AT						
External Temperature Monitor (external diode 2N3904, T_J = 25°C)[4]	Resolution	8-bit ADC		4		°C
		10-bit ADC		1		°C
		12-bit ADC		0.25		°C
	Systematic Offset[5]	AFS090, AFS250, AFS600, AFS1500, uncalibrated[7]		5		°C
		AFS090, AFS250, AFS600, AFS1500, calibrated[7]		±5		°C
	Accuracy			±3	±5	°C
	External Sensor Source Current	High level, TMSTBx = 0		10		µA
		Low level, TMSTBx = 1		100		µA
	Max Capacitance on AT pad				1.3	nF
Internal Temperature Monitor	Resolution	8-bit ADC	4			°C
		10-bit ADC	1			°C
		12-bit ADC	0.25			°C
	Systematic Offset[5]	AFS090[7]		5		°C
		AFS250, AFS600, AFS1500[7]		11		°C
	Accuracy			±3	±5	°C
t_{TMSHI}	Strobe High time		10		105	µs
t_{TMSLO}	Strobe Low time		5			µs
t_{TMSSET}	Settling time		5			µs

Notes:

1. *VRSM is the maximum voltage drop across the current sense resistor.*
2. *Analog inputs used as digital inputs can tolerate the same voltage limits as the corresponding analog pad. There is no reliability concern on digital inputs as long as VIND does not exceed these limits.*
3. *VIND is limited to VCC33A + 0.2 to allow reaching 10 MHz input frequency.*
4. *An averaging of 1,024 samples (LPF setting in Analog System Builder) is required and the maximum capacitance allowed across the AT pins is 500 pF.*
5. *The temperature offset is a fixed positive value.*
6. *The high current mode has a maximum power limit of 20 mW. Appropriate current limit resistors must be used, based on voltage on the pad.*
7. *When using SmartGen Analog System Builder, CalibIP is required to obtain specified offset. For further details on CalibIP, refer to the "Temperature, Voltage, and Current Calibration in Fusion FPGAs" chapter of the* Fusion FPGA Fabric User Guide.

User I/O Naming Convention

Due to the comprehensive and flexible nature of Fusion device user I/Os, a naming scheme is used to show the details of the I/O (Figure 2-113 on page 2-158 and Figure 2-114 on page 2-159). The name identifies to which I/O bank it belongs, as well as the pairing and pin polarity for differential I/Os.

I/O Nomenclature = Gmn/IOuxwByVz

Gmn is only used for I/Os that also have CCC access—i.e., global pins.

G = Global

m = Global pin location associated with each CCC on the device: A (northwest corner), B (northeast corner), C (east middle), D (southeast corner), E (southwest corner), and F (west middle).

n = Global input MUX and pin number of the associated Global location m, either A0, A1, A2, B0, B1, B2, C0, C1, or C2. Figure 2-22 on page 2-25 shows the three input pins per clock source MUX at CCC location m.

u = I/O pair number in the bank, starting at 00 from the northwest I/O bank and proceeding in a clockwise direction.

x = P (Positive) or N (Negative) for differential pairs, or R (Regular – single-ended) for the I/Os that support single-ended and voltage-referenced I/O standards only. U (Positive-LVDS only) or V (Negative-LVDS only) restrict the I/O differential pair from being selected as an LVPECL pair.

w = D (Differential Pair), P (Pair), or S (Single-Ended). D (Differential Pair) if both members of the pair are bonded out to adjacent pins or are separated only by one GND or NC pin; P (Pair) if both members of the pair are bonded out but do not meet the adjacency requirement; or S (Single-Ended) if the I/O pair is not bonded out. For Differential (D) pairs, adjacency for ball grid packages means only vertical or horizontal. Diagonal adjacency does not meet the requirements for a true differential pair.

B = Bank

y = Bank number (0–3). The Bank number starts at 0 from the northwest I/O bank and proceeds in a clockwise direction.

V = Reference voltage

z = Minibank number

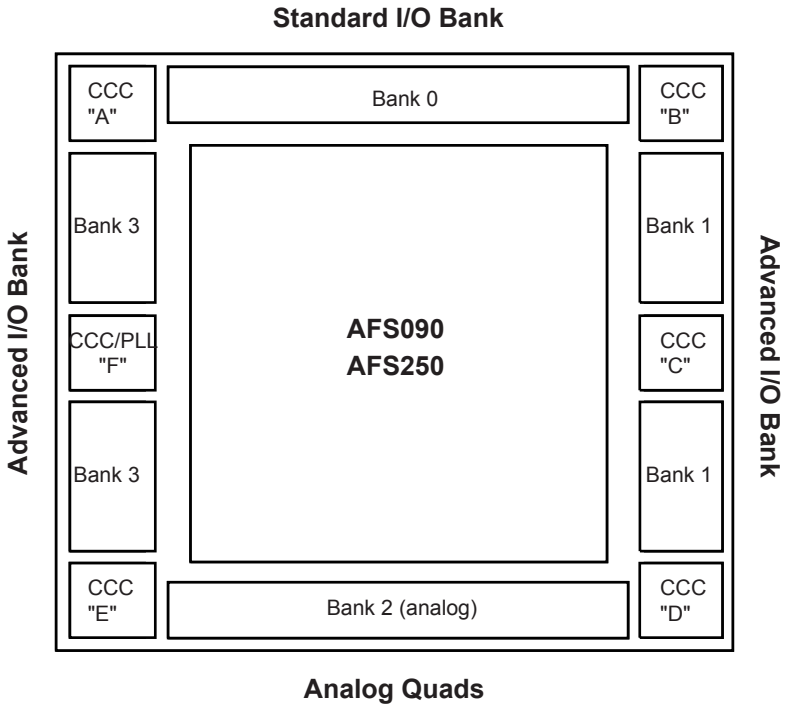

***Figure 2-113* • Naming Conventions of Fusion Devices with Three Digital I/O Banks**

Table 2-96 • I/O Output Buffer Maximum Resistances [1] (continued)

Standard	Drive Strength	$R_{PULL-DOWN}$ (ohms) [2]	$R_{PULL-UP}$ (ohms) [3]
Applicable to Standard I/O Banks			
3.3 V LVTTL / 3.3 V LVCMOS	2 mA	100	300
	4 mA	100	300
	6 mA	50	150
	8 mA	50	150
2.5 V LVCMOS	2 mA	100	200
	4 mA	100	200
	6 mA	50	100
	8 mA	50	100
1.8 V LVCMOS	2 mA	200	225
	4 mA	100	112
1.5 V LVCMOS	2 mA	200	224

Notes:

1. *These maximum values are provided for informational reasons only. Minimum output buffer resistance values depend on VCC, drive strength selection, temperature, and process. For board design considerations and detailed output buffer resistances, use the corresponding IBIS models located on the Microsemi SoC Products Group website: http://www.microsemi.com/soc/techdocs/models/ibis.html.*
2. $R_{(PULL-DOWN-MAX)} = VOLspec / I_{OLspec}$
3. $R_{(PULL-UP-MAX)} = (VCCImax – VOHspec) / IOHspec$

Table 2-97 • I/O Weak Pull-Up/Pull-Down Resistances
Minimum and Maximum Weak Pull-Up/Pull-Down Resistance Values

VCCI	$R_{(WEAK\ PULL-UP)}$ [1] (ohms)		$R_{(WEAK\ PULL-DOWN)}$ [2] (ohms)	
	Min.	Max.	Min.	Max.
3.3 V	10 k	45 k	10 k	45 k
2.5 V	11 k	55 k	12 k	74 k
1.8 V	18 k	70 k	17 k	110 k
1.5 V	19 k	90 k	19 k	140 k

Notes:

1. $R_{(WEAK\ PULL-UP-MAX)} = (VCCImax – VOHspec) / I_{WEAK\ PULL-UP-MIN}$
2. $R_{(WEAK\ PULL-DOWN-MAX)} = VOLspec / I_{WEAK\ PULL-DOWN-MIN}$

Table 2-132 • 1.5 V LVCMOS Low Slew

	–2	0.49	5.71	0.03	1.06	0.32	4.71	5.71	1.83	1.83	ns

Note: For the derating values at specific junction temperature and voltage supply levels, refer to Table 3-7 on page 3-9.

Differential I/O Characteristics

Configuration of the I/O modules as a differential pair is handled by the Microsemi Designer software when the user instantiates a differential I/O macro in the design.

Differential I/Os can also be used in conjunction with the embedded Input Register (InReg), Output Register (OutReg), Enable Register (EnReg), and Double Data Rate (DDR). However, there is no support for bidirectional I/Os or tristates with these standards.

LVDS

Low-Voltage Differential Signal (ANSI/TIA/EIA-644) is a high-speed differential I/O standard. It requires that one data bit be carried through two signal lines, so two pins are needed. It also requires external resistor termination.

The full implementation of the LVDS transmitter and receiver is shown in an example in Figure 2-134. The building blocks of the LVDS transmitter–receiver are one transmitter macro, one receiver macro, three board resistors at the transmitter end, and one resistor at the receiver end. The values for the three driver resistors are different from those used in the LVPECL implementation because the output standard specifications are different.

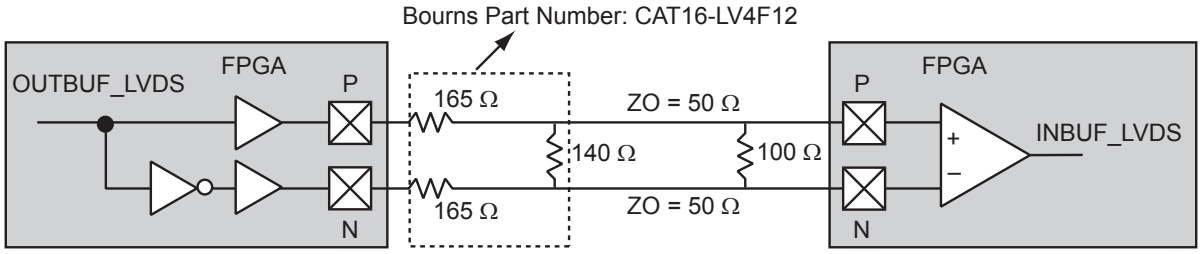

***Figure 2-134* • LVDS Circuit Diagram and Board-Level Implementation**

***Table 2-168* • Minimum and Maximum DC Input and Output Levels**

DC Parameter	Description	Min.	Typ.	Max.	Units
VCCI	Supply Voltage	2.375	2.5	2.625	V
VOL	Output Low Voltage	0.9	1.075	1.25	V
VOH	Input High Voltage	1.25	1.425	1.6	V
IOL [1]	Output Low Voltage	0.65	0.91	1.16	mA
IOH [1]	Output High Voltage	0.65	0.91	1.16	mA
VI	Input Voltage	0		2.925	V
IIL [2,3]	Input Low Voltage			10	µA
IIH [2,4]	Input High Voltage			10	µA
VODIFF	Differential Output Voltage	250	350	450	mV
VOCM	Output Common Mode Voltage	1.125	1.25	1.375	V
VICM	Input Common Mode Voltage	0.05	1.25	2.35	V
VIDIFF	Input Differential Voltage	100	350		mV

Notes:

1. *IOL/IOH defined by VODIFF/(Resistor Network)*
2. *Currents are measured at 85°C junction temperature.*
3. *IIL is the input leakage current per I/O pin over recommended operation conditions where –0.3 V < VIN < VIL.*
4. *IIH is the input leakage current per I/O pin over recommended operating conditions VIH < VIN < VCCI. Input current is larger when operating outside recommended ranges.*

Pin Descriptions

Supply Pins

GND **Ground**

Ground supply voltage to the core, I/O outputs, and I/O logic.

GNDQ **Ground (quiet)**

Quiet ground supply voltage to input buffers of I/O banks. Within the package, the GNDQ plane is decoupled from the simultaneous switching noise originated from the output buffer ground domain. This minimizes the noise transfer within the package and improves input signal integrity. GNDQ needs to always be connected on the board to GND. Note: In FG256, FG484, and FG676 packages, GNDQ and GND pins are connected within the package and are labeled as GND pins in the respective package pin assignment tables.

ADCGNDREF **Analog Reference Ground**

Analog ground reference used by the ADC. This pad should be connected to a quiet analog ground.

GNDA **Ground (analog)**

Quiet ground supply voltage to the Analog Block of Fusion devices. The use of a separate analog ground helps isolate the analog functionality of the Fusion device from any digital switching noise. A 0.2 V maximum differential voltage between GND and GNDA/GNDQ should apply to system implementation.

GNDAQ **Ground (analog quiet)**

Quiet ground supply voltage to the analog I/O of Fusion devices. The use of a separate analog ground helps isolate the analog functionality of the Fusion device from any digital switching noise. A 0.2 V maximum differential voltage between GND and GNDA/GNDQ should apply to system implementation. Note: In FG256, FG484, and FG676 packages, GNDAQ and GNDA pins are connected within the package and are labeled as GNDA pins in the respective package pin assignment tables.

GNDNVM **Flash Memory Ground**

Ground supply used by the Fusion device's flash memory block module(s).

GNDOSC **Oscillator Ground**

Ground supply for both integrated RC oscillator and crystal oscillator circuit.

VCC15A **Analog Power Supply (1.5 V)**

1.5 V clean analog power supply input for use by the 1.5 V portion of the analog circuitry.

VCC33A **Analog Power Supply (3.3 V)**

3.3 V clean analog power supply input for use by the 3.3 V portion of the analog circuitry.

VCC33N **Negative 3.3 V Output**

This is the –3.3 V output from the voltage converter. A 2.2 µF capacitor must be connected from this pin to ground.

VCC33PMP **Analog Power Supply (3.3 V)**

3.3 V clean analog power supply input for use by the analog charge pump. To avoid high current draw, VCC33PMP should be powered up simultaneously with or after VCC33A.

VCCNVM **Flash Memory Block Power Supply (1.5 V)**

1.5 V power supply input used by the Fusion device's flash memory block module(s). To avoid high current draw, VCC should be powered up before or simultaneously with VCCNVM.

VCCOSC **Oscillator Power Supply (3.3 V)**

Power supply for both integrated RC oscillator and crystal oscillator circuit. The internal 100 MHz oscillator, powered by the VCCOSC pin, is needed for device programming, operation of the VDDN33 pump, and eNVM operation. VCCOSC is off only when VCCA is off. VCCOSC must be powered whenever the Fusion device needs to function.

Table 3-8 • **AFS1500 Quiescent Supply Current Characteristics (continued)**

Parameter	Description	Conditions	Temp.	Min.	Typ.	Max.	Unit
IJTAG	JTAG I/O quiescent current	Operational standby[4], VJTAG = 3.63 V	T_J = 25°C		80	100	µA
			T_J = 85°C		80	100	µA
			T_J = 100°C		80	100	µA
		Standby mode[5] or Sleep mode[6], VJTAG = 0 V			0	0	µA
IPP	Programming supply current	Non-programming mode, VPUMP = 3.63 V	T_J = 25°C		39	80	µA
			T_J = 85°C		40	80	µA
			T_J = 100°C		40	80	µA
		Standby mode[5] or Sleep mode[6], VPUMP = 0 V			0	0	µA
ICCNVM	Embedded NVM current	Reset asserted, V_{CCNVM} = 1.575 V	T_J = 25°C		50	150	µA
			T_J =85°C		50	150	µA
			T_J = 100°C		50	150	µA
ICCPLL	1.5 V PLL quiescent current	Operational standby , VCCPLL = 1.575 V	T_J = 25°C		130	200	µA
			T_J = 85°C		130	200	µA
			T_J = 100°C		130	200	µA

Notes:

1. *ICC is the 1.5 V power supplies, ICC and ICC15A.*
2. *ICC33A includes ICC33A, ICC33PMP, and ICCOSC.*
3. *ICCI includes all ICCI0, ICCI1, ICCI2, and ICCI4.*
4. *Operational standby is when the Fusion device is powered up, all blocks are used, no I/O is toggling, Voltage Regulator is loaded with 200 mA, VCC33PMP is ON, XTAL is ON, and ADC is ON.*
5. *XTAL is configured as high gain, VCC = VJTAG = VPUMP = 0 V.*
6. *Sleep Mode, VCC = VJTAG = VPUMP = 0 V.*

Table 3-13 • **Summary of I/O Output Buffer Power (per pin)—Default I/O Software Settings[1]**

	C_{LOAD} (pF)	VCCI (V)	Static Power PDC8 (mW)[2]	Dynamic Power PAC10 (µW/MHz)[3]
Applicable to Pro I/O Banks				
Single-Ended				
3.3 V LVTTL/LVCMOS	35	3.3	–	474.70
2.5 V LVCMOS	35	2.5	–	270.73
1.8 V LVCMOS	35	1.8	–	151.78
1.5 V LVCMOS (JESD8-11)	35	1.5	–	104.55
3.3 V PCI	10	3.3	–	204.61
3.3 V PCI-X	10	3.3	–	204.61
Voltage-Referenced				
3.3 V GTL	10	3.3	–	24.08
2.5 V GTL	10	2.5	–	13.52

SSTL2 (II)	30	2.5	25.91	116.60
SSTL3 (I)	30	3.3	26.02	114.87
SSTL3 (II)	30	3.3	42.21	131.76
Differential				
LVDS	–	2.5	7.70	89.62
LVPECL	–	3.3	19.42	168.02
Applicable to Advanced I/O Banks				
Single-Ended				
3.3 V LVTTL / 3.3 V LVCMOS	35	3.3	–	468.67
2.5 V LVCMOS	35	2.5	–	267.48
1.8 V LVCMOS	35	1.8	–	149.46
1.5 V LVCMOS (JESD8-11)	35	1.5	–	103.12
3.3 V PCI	10	3.3	–	201.02
3.3 V PCI-X	10	3.3	–	201.02

Notes:

1. *Dynamic power consumption is given for standard load and software-default drive strength and output slew.*
2. *PDC8 is the static power (where applicable) measured on VCCI.*
3. *PAC10 is the total dynamic power measured on VCC and VCCI.*

Dynamic Power Consumption of Various Internal Resources

Table 3-14 • **Different Components Contributing to the Dynamic Power Consumption in Fusion Devices**

Parameter	Definition	Power Supply		Device-Specific Dynamic Contributions				Units
		Name	Setting	AFS1500	AFS600	AFS250	AFS090	
PAC1	Clock contribution of a Global Rib	VCC	1.5 V	14.5	12.8	11	11	µW/MHz
PAC2	Clock contribution of a Global Spine	VCC	1.5 V	2.5	1.9	1.6	0.8	µW/MHz
PAC3	Clock contribution of a VersaTile row	VCC	1.5 V	0.81				µW/MHz
PAC4	Clock contribution of a VersaTile used as a sequential module	VCC	1.5 V	0.11				µW/MHz
PAC5	First contribution of a VersaTile used as a sequential module	VCC	1.5 V	0.07				µW/MHz
PAC6	Second contribution of a VersaTile used as a sequential module	VCC	1.5 V	0.29				µW/MHz
PAC7	Contribution of a VersaTile used as a combinatorial module	VCC	1.5 V	0.29				µW/MHz
PAC8	Average contribution of a routing net	VCC	1.5 V	0.70				µW/MHz
PAC9	Contribution of an I/O input pin (standard dependent)	VCCI	See Table 3-12 on page 3-18					
PAC10	Contribution of an I/O output pin (standard dependent)	VCCI	See Table 3-13 on page 3-20					
PAC11	Average contribution of a RAM block during a read operation	VCC	1.5 V	25				µW/MHz
PAC12	Average contribution of a RAM block during a write operation	VCC	1.5 V	30				µW/MHz
PAC13	Dynamic Contribution for PLL	VCC	1.5 V	2.6				µW/MHz
PAC15	Contribution of NVM block during a read operation (F < 33MHz)	VCC	1.5 V	358				µW/MHz
PAC16	1st contribution of NVM block during a read operation (F > 33 MHz)	VCC	1.5 V	12.88				mW
PAC17	2nd contribution of NVM block during a read operation (F > 33 MHz)	VCC	1.5 V	4.8				µW/MHz
PAC18	Crystal Oscillator contribution	VCC33A	3.3 V	0.63				mW
PAC19	RC Oscillator contribution	VCC33A	3.3 V	3.3				mW
PAC20	Analog Block dynamic power contribution of ADC	VCC	1.5 V	3				mW

Methodology

Total Power Consumption—P_{TOTAL}

Operating Mode, Standby Mode, and Sleep Mode

$P_{TOTAL} = P_{STAT} + P_{DYN}$

P_{STAT} is the total static power consumption.

P_{DYN} is the total dynamic power consumption.

Total Static Power Consumption—P_{STAT}

Operating Mode

$P_{STAT} = PDC1 + (N_{NVM\text{-}BLOCKS} * PDC4) + PDC5+ (N_{QUADS} * PDC6) + (N_{INPUTS} * PDC7) + (N_{OUTPUTS} * PDC8) + (N_{PLLS} * PDC9)$

$N_{NVM\text{-}BLOCKS}$ is the number of NVM blocks available in the device.

N_{QUADS} is the number of Analog Quads used in the design.

N_{INPUTS} is the number of I/O input buffers used in the design.

$N_{OUTPUTS}$ is the number of I/O output buffers used in the design.

N_{PLLS} is the number of PLLs available in the device.

Standby Mode

$P_{STAT} = PDC2$

Sleep Mode

$P_{STAT} = PDC3$

Total Dynamic Power Consumption—P_{DYN}

Operating Mode

$P_{DYN} = P_{CLOCK} + P_{S\text{-}CELL} + P_{C\text{-}CELL} + P_{NET} + P_{INPUTS} + P_{OUTPUTS} + P_{MEMORY} + P_{PLL} + P_{NVM} + P_{XTL\text{-}OSC} + P_{RC\text{-}OSC} + P_{AB}$

Standby Mode

$P_{DYN} = P_{XTL\text{-}OSC}$

Sleep Mode

$P_{DYN} = 0$ W

Global Clock Dynamic Contribution—P_{CLOCK}

Operating Mode

$P_{CLOCK} = (PAC1 + N_{SPINE} * PAC2 + N_{ROW} * PAC3 + N_{S\text{-}CELL} * PAC4) * F_{CLK}$

N_{SPINE} is the number of global spines used in the user design—guidelines are provided in the "Spine Architecture" section of the Global Resources chapter in the *Fusion and Extended Temperature Fusion FPGA Fabric User's Guide*.

N_{ROW} is the number of VersaTile rows used in the design—guidelines are provided in the "Spine Architecture" section of the Global Resources chapter in the *Fusion and Extended Temperature Fusion FPGA Fabric User's Guide*.

F_{CLK} is the global clock signal frequency.

$N_{S\text{-}CELL}$ is the number of VersaTiles used as sequential modules in the design.

Standby Mode and Sleep Mode

$P_{CLOCK} = 0$ W

Sequential Cells Dynamic Contribution—$P_{S\text{-}CELL}$

Operating Mode

RC Oscillator Dynamic Contribution—$P_{RC\text{-}OSC}$

Operating Mode

$P_{RC\text{-}OSC}$ = PAC19

Standby Mode and Sleep Mode

$P_{RC\text{-}OSC}$ = 0 W

Analog System Dynamic Contribution—P_{AB}

Operating Mode

P_{AB} = PAC20

Standby Mode and Sleep Mode

P_{AB} = 0 W

Guidelines

Toggle Rate Definition

A toggle rate defines the frequency of a net or logic element relative to a clock. It is a percentage. If the toggle rate of a net is 100%, this means that the net switches at half the clock frequency. Below are some examples:

- The average toggle rate of a shift register is 100%, as all flip-flop outputs toggle at half of the clock frequency.
- The average toggle rate of an 8-bit counter is 25%:
  - Bit 0 (LSB) = 100%
  - Bit 1 = 50%
  - Bit 2 = 25%
  - …
  - Bit 7 (MSB) = 0.78125%
  - Average toggle rate = (100% + 50% + 25% + 12.5% + . . . 0.78125%) / 8.

Enable Rate Definition

Output enable rate is the average percentage of time during which tristate outputs are enabled. When non-tristate output buffers are used, the enable rate should be 100%.

***Table 3-16* • Toggle Rate Guidelines Recommended for Power Calculation**

Component	Definition	Guideline
α_1	Toggle rate of VersaTile outputs	10%
α_2	I/O buffer toggle rate	10%

***Table 3-17* • Enable Rate Guidelines Recommended for Power Calculation**

Component	Definition	Guideline
β_1	I/O output buffer enable rate	100%
β_2	RAM enable rate for read operations	12.5%
β_3	RAM enable rate for write operations	12.5%
β_4	NVM enable rate for read operations	0%
