
Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Active
Number of LABs/CLBs	-
Number of Logic Elements/Cells	-
Total RAM Bits	276480
Number of I/O	223
Number of Gates	1500000
Voltage - Supply	1.425V ~ 1.575V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	484-BGA
Supplier Device Package	484-FPBGA (23x23)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/m1afs1500-1fg484

2 – Device Architecture

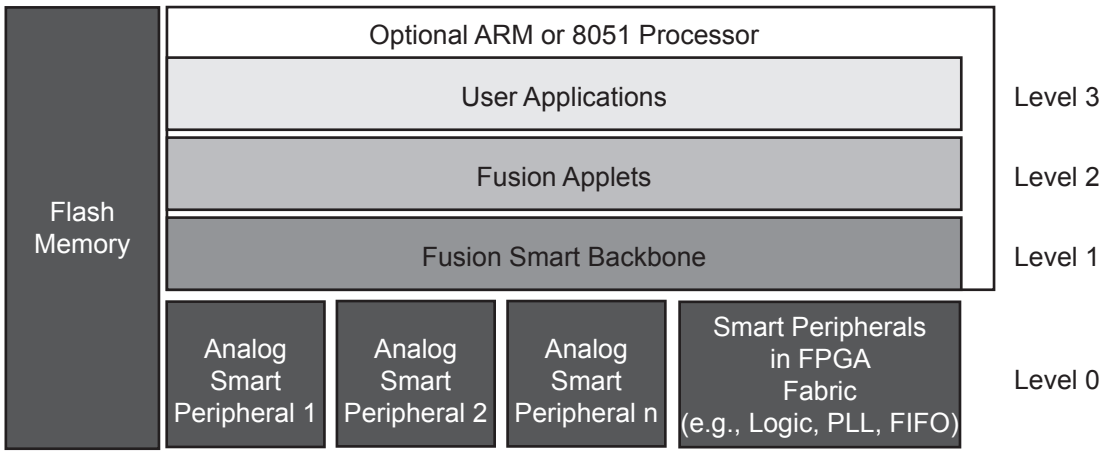
Fusion Stack Architecture

To manage the unprecedented level of integration in Fusion devices, Microsemi developed the Fusion technology stack (Figure 2-1). This layered model offers a flexible design environment, enabling design at very high and very low levels of abstraction. Fusion peripherals include hard analog IP and hard and soft digital IP. Peripherals communicate across the FPGA fabric via a layer of soft gates—the Fusion backbone. Much more than a common bus interface, this Fusion backbone integrates a micro-sequencer within the FPGA fabric and configures the individual peripherals and supports low-level processing of peripheral data. Fusion applets are application building blocks that can control and respond to peripherals and other system signals. Applets can be rapidly combined to create large applications. The technology is scalable across devices, families, design types, and user expertise, and supports a well-defined interface for external IP and tool integration.

At the lowest level, Level 0, are Fusion peripherals. These are configurable functional blocks that can be hardwired structures such as a PLL or analog input channel, or soft (FPGA gate) blocks such as a UART or two-wire serial interface. The Fusion peripherals are configurable and support a standard interface to facilitate communication and implementation.

Connecting and controlling access to the peripherals is the Fusion backbone, Level 1. The backbone is a soft-gate structure, scalable to any number of peripherals. The backbone is a bus and much more; it manages peripheral configuration to ensure proper operation. Leveraging the common peripheral interface and a low-level state machine, the backbone efficiently offloads peripheral management from the system design. The backbone can set and clear flags based upon peripheral behavior and can define performance criteria. The flexibility of the stack enables a designer to configure the silicon, directly bypassing the backbone if that level of control is desired.

One step up from the backbone is the Fusion applet, Level 2. The applet is an application building block that implements a specific function in FPGA gates. It can react to stimuli and board-level events coming through the backbone or from other sources, and responds to these stimuli by accessing and manipulating peripherals via the backbone or initiating some other action. An applet controls or responds to the peripheral(s). Applets can be easily imported or exported from the design environment. The applet structure is open and well-defined, enabling users to import applets from Microsemi, system developers, third parties, and user groups.



Note: Levels 1, 2, and 3 are implemented in FPGA logic gates.

MUX2	Y = A !S + B S	t_{PD}	0.51	0.58	0.68	ns
AND3	Y = A · B · C	t_{PD}	0.56	0.64	0.75	ns

Note: For the derating values at specific junction temperature and voltage supply levels, refer to Table 3-7 on page 3-9.

Sample VersaTile Specifications—Sequential Module

The Fusion library offers a wide variety of sequential cells, including flip-flops and latches. Each has a data input and optional enable, clear, or preset. In this section, timing characteristics are presented for a representative sample from the library (Figure 2-5). For more details, refer to the *IGLOO, ProASIC3, SmartFusion and Fusion Macro Library Guide*.

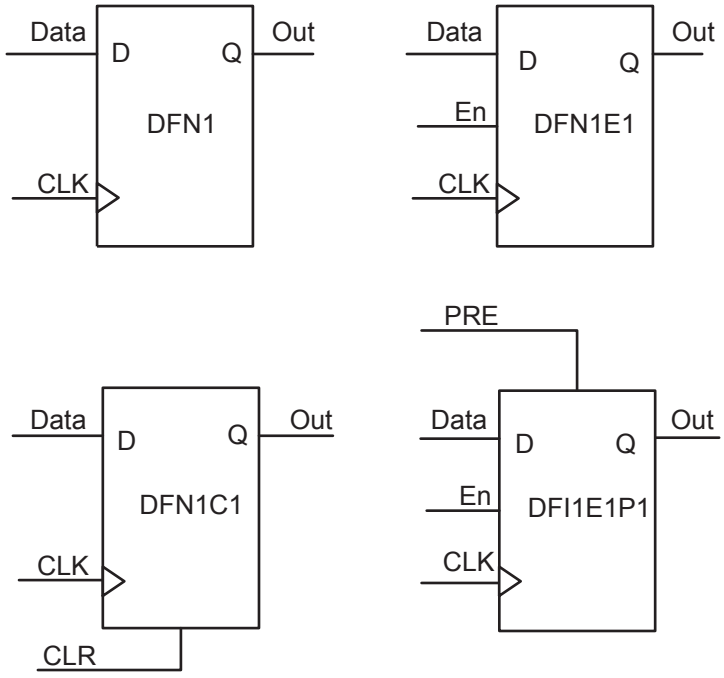

Figure 2-5 • Sample of Sequential Cells

VersaNet Global Networks and Spine Access

The Fusion architecture contains a total of 18 segmented global networks that can access the VersaTiles, SRAM, and I/O tiles on the Fusion device. There are 6 chip (main) global networks that access the entire device and 12 quadrant networks (3 in each quadrant). Each device has a total of 18 globals. These VersaNet global networks offer fast, low-skew routing resources for high-fanout nets, including clock signals. In addition, these highly segmented global networks offer users the flexibility to create low-skew local networks using spines for up to 180 internal/external clocks (in an AFS1500 device) or other high-fanout nets in Fusion devices. Optimal usage of these low-skew networks can result in significant improvement in design performance on Fusion devices.

The nine spines available in a vertical column reside in global networks with two separate regions of scope: the quadrant global network, which has three spines, and the chip (main) global network, which has six spines. Note that there are three quadrant spines in each quadrant of the device. There are four quadrant global network regions per device (Figure 2-12 on page 2-12).

The spines are the vertical branches of the global network tree, shown in Figure 2-11 on page 2-11. Each spine in a vertical column of a chip (main) global network is further divided into two equal-length spine segments: one in the top and one in the bottom half of the die.

Each spine and its associated ribs cover a certain area of the Fusion device (the "scope" of the spine; see Figure 2-11 on page 2-11). Each spine is accessed by the dedicated global network MUX tree architecture, which defines how a particular spine is driven—either by the signal on the global network from a CCC, for example, or another net defined by the user (Figure 2-13). Quadrant spines can be driven from user I/Os on the north and south sides of the die, via analog I/Os configured as direct digital inputs. The ability to drive spines in the quadrant global networks can have a significant effect on system performance for high-fanout inputs to a design.

Details of the chip (main) global network spine-selection MUX are presented in Figure 2-13. The spine drivers for each spine are located in the middle of the die.

Quadrant spines are driven from a north or south rib. Access to the top and bottom ribs is from the corner CCC or from the I/Os on the north and south sides of the device. For details on using spines in Fusion devices, see the application note *Using Global Resources in Actel Fusion Devices*.

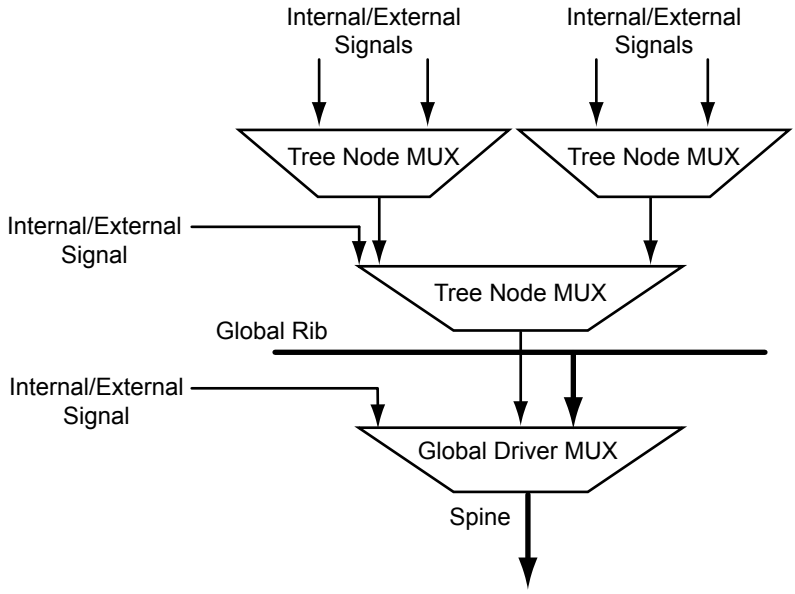

Figure 2-13 • **Spine-Selection MUX of Global Tree**

Table 2-7 • AFS250 Global Resource Timing
Commercial Temperature Range Conditions: T_J = 70°C, Worst-Case VCC = 1.425 V

Parameter	Description	–2		–1		Std.		Units
		Min.[1]	Max.[2]	Min.[1]	Max.[2]	Min.[1]	Max.[2]	
t_{RCKL}	Input Low Delay for Global Clock	0.89	1.12	1.02	1.27	1.20	1.50	ns
t_{RCKH}	Input High Delay for Global Clock	0.88	1.14	1.00	1.30	1.17	1.53	ns
$t_{RCKMPWH}$	Minimum Pulse Width High for Global Clock							ns
$t_{RCKMPWL}$	Minimum Pulse Width Low for Global Clock							ns
t_{RCKSW}	Maximum Skew for Global Clock		0.26		0.30		0.35	ns

Notes:

1. *Value reflects minimum load. The delay is measured from the CCC output to the clock pin of a sequential element located in a lightly loaded row (single element is connected to the global net).*
2. *Value reflects maximum load. The delay is measured on the clock pin of the farthest sequential element located in a fully loaded row (all available flip-flops are connected to the global net in the row).*
3. *For the derating values at specific junction temperature and voltage supply levels, refer to Table 3-7 on page 3-9.*

$t_{RCKMPWH}$	Minimum Pulse Width High for Global Clock							ns
$t_{RCKMPWL}$	Minimum Pulse Width Low for Global Clock							ns
t_{RCKSW}	Maximum Skew for Global Clock		0.27		0.30		0.36	ns

Notes:

1. *Value reflects minimum load. The delay is measured from the CCC output to the clock pin of a sequential element located in a lightly loaded row (single element is connected to the global net).*
2. *Value reflects maximum load. The delay is measured on the clock pin of the farthest sequential element located in a fully loaded row (all available flip-flops are connected to the global net in the row).*
3. *For the derating values at specific junction temperature and voltage supply levels, refer to Table 3-7 on page 3-9.*

RAM4K9 Description

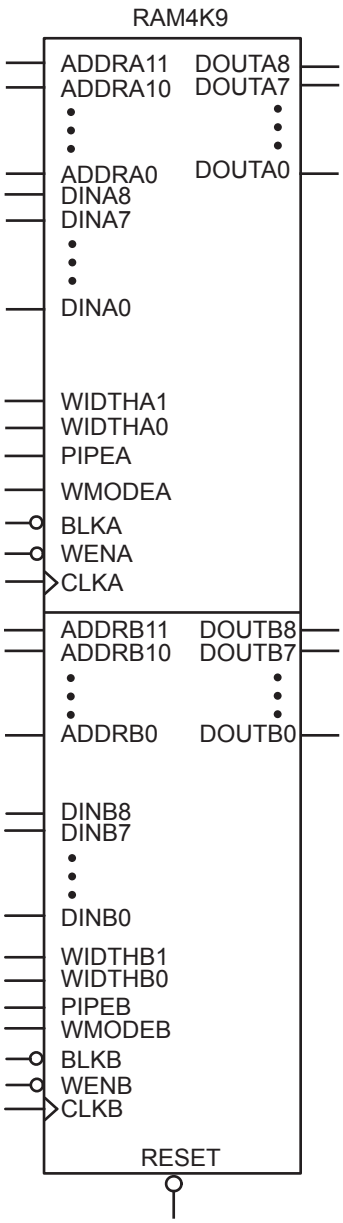

Figure 2-48 • **RAM4K9**

INL – Integral Non-Linearity

INL is the deviation of an actual transfer function from a straight line. After nullifying offset and gain errors, the straight line is either a best-fit straight line or a line drawn between the end points of the transfer function (Figure 2-85).

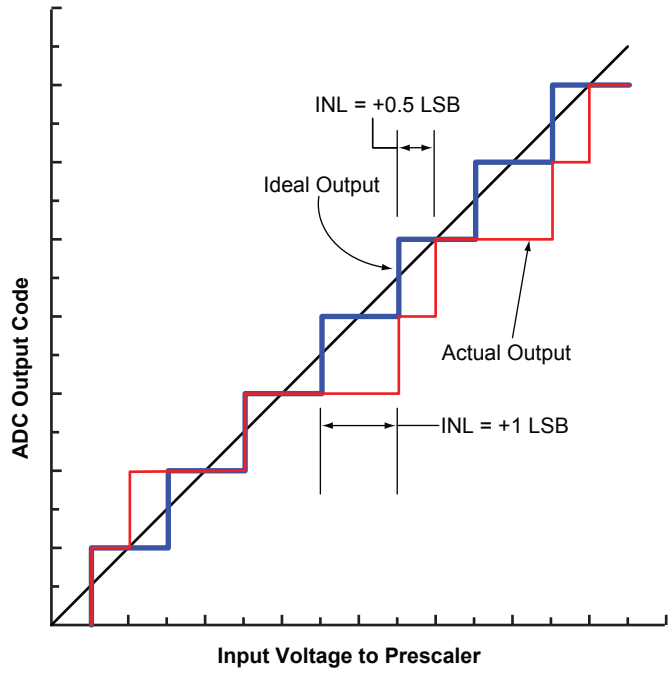

Figure 2-85 • **Integral Non-Linearity (INL)**

LSB – Least Significant Bit

In a binary number, the LSB is the least weighted bit in the group. Typically, the LSB is the furthest right bit. For an ADC, the weight of an LSB equals the full-scale voltage range of the converter divided by 2^N, where N is the converter's resolution.

EQ 13 shows the calculation for a 10-bit ADC with a unipolar full-scale voltage of 2.56 V:

$$1\ \text{LSB} = (2.56\ \text{V} / 2^{10}) = 2.5\ \text{mV}$$

EQ 13

No Missing Codes

An ADC has no missing codes if it produces all possible digital codes in response to a ramp signal applied to the analog input.

TUE – Total Unadjusted Error

TUE is a comprehensive specification that includes linearity errors, gain error, and offset error. It is the worst-case deviation from the ideal device performance. TUE is a static specification (Figure 2-87).

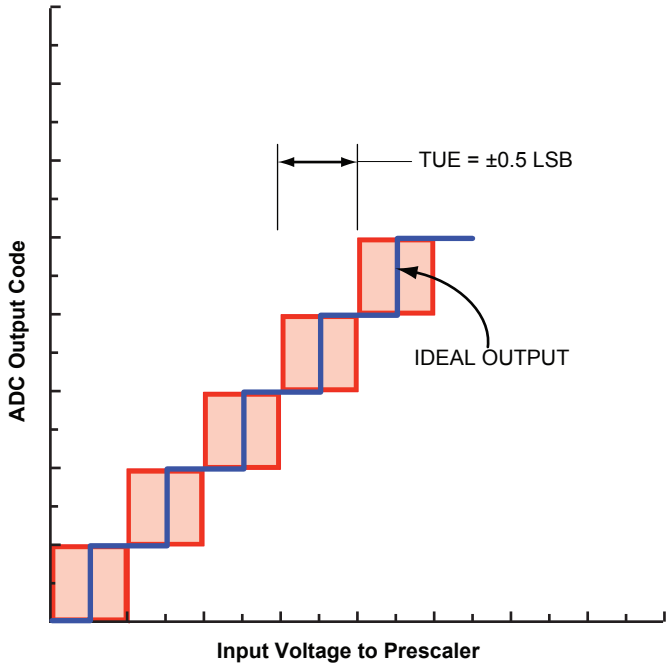

***Figure 2-87* • Total Unadjusted Error (TUE)**

ADC Operation

Once the ADC has powered up and been released from reset, ADCRESET, the ADC will initiate a calibration routine designed to provide optimal ADC performance. The Fusion ADC offers a robust calibration scheme to reduce integrated offset and linearity errors. The offset and linearity errors of the main capacitor array are compensated for with an 8-bit calibration capacitor array. The offset/linearity error calibration is carried out in two ways. First, a power-up calibration is carried out when the ADC comes out of reset. This is initiated by the CALIBRATE output of the Analog Block macro and is a fixed number of ADC_CLK cycles (3,840 cycles), as shown in Figure 2-89 on page 2-111. In this mode, the linearity and offset errors of the capacitors are calibrated.

To further compensate for drift and temperature-dependent effects, every conversion is followed by post-calibration of either the offset or a bit of the main capacitor array. The post-calibration ensures that, over time and with temperature, the ADC remains consistent.

After both calibration and the setting of the appropriate configurations, as explained above, the ADC is ready for operation. Setting the ADCSTART signal high for one clock period will initiate the sample and conversion of the analog signal on the channel as configured by CHNUMBER[4:0]. The status signals SAMPLE and BUSY will show when the ADC is sampling and converting (Figure 2-91 on page 2-112). Both SAMPLE and BUSY will initially go high. After the ADC has sampled and held the analog signal, SAMPLE will go low. After the entire operation has completed and the analog signal is converted, BUSY will go low and DATAVALID will go high. This indicates that the digital result is available on the RESULT[11:0] pins.

DATAVALID will remain high until a subsequent ADCSTART is issued. The DATAVALID goes low on the rising edge of SYSCLK as shown in Figure 2-90 on page 2-112. The RESULT signals will be kept constant until the ADC finishes the subsequent sample. The next sampled RESULT will be available when DATAVALID goes high again. It is ideal to read the RESULT when DATAVALID is '1'. The RESULT is latched and remains unchanged until the next DATAVLAID rising edge.

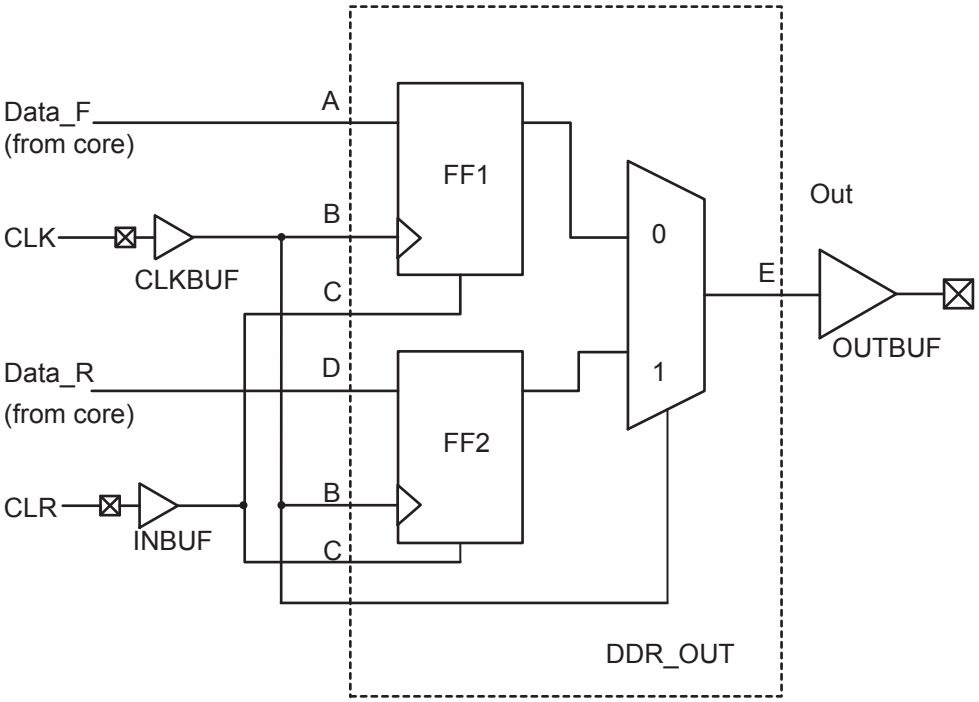

***Figure 2-102* • DDR Output Support in Fusion Devices**

Table 2-99 • Short Current Event Duration before Failure

Temperature	Time Before Failure
–40°C	>20 years
0°C	>20 years
25°C	>20 years
70°C	5 years
85°C	2 years
100°C	6 months

Table 2-100 • Schmitt Trigger Input Hysteresis
Hysteresis Voltage Value (typ.) for Schmitt Mode Input Buffers

Input Buffer Configuration	Hysteresis Value (typ.)
3.3 V LVTTL/LVCMOS/PCI/PCI-X (Schmitt trigger mode)	240 mV
2.5 V LVCMOS (Schmitt trigger mode)	140 mV
1.8 V LVCMOS (Schmitt trigger mode)	80 mV
1.5 V LVCMOS (Schmitt trigger mode)	60 mV

Table 2-101 • I/O Input Rise Time, Fall Time, and Related I/O Reliability

Input Buffer	Input Rise/Fall Time (min.)	Input Rise/Fall Time (max.)	Reliability
LVTTL/LVCMOS (Schmitt trigger disabled)	No requirement	10 ns*	20 years (100°C)
LVTTL/LVCMOS (Schmitt trigger enabled)	No requirement	No requirement, but input noise voltage cannot exceed Schmitt hysteresis	20 years (100°C)
HSTL/SSTL/GTL	No requirement	10 ns*	10 years (100°C)
LVDS/BLVDS/M-LVDS/LVPECL	No requirement	10 ns*	10 years (100°C)

*Note: * The maximum input rise/fall time is related only to the noise induced into the input buffer trace. If the noise is low, the rise time and fall time of input buffers, when Schmitt trigger is disabled, can be increased beyond the maximum value. The longer the rise/fall times, the more susceptible the input signal is to the board noise. Microsemi recommends signal integrity evaluation/characterization of the system to ensure there is no excessive noise coupling into input signals.*

Table 2-103 • AC Waveforms, Measuring Points, and Capacitive Loads

Input Low (V)	Input High (V)	Measuring Point* (V)	VREF (typ.) (V)	C_{LOAD} (pF)
0	3.3	1.4	–	35

*Note: *Measuring point = Vtrip. See Table 2-90 on page 2-166 for a complete table of trip points.*

Note: For the derating values at specific junction temperature and voltage supply levels, refer to Table 3-7 on page 3-9.

Differential I/O Characteristics

Configuration of the I/O modules as a differential pair is handled by the Microsemi Designer software when the user instantiates a differential I/O macro in the design.

Differential I/Os can also be used in conjunction with the embedded Input Register (InReg), Output Register (OutReg), Enable Register (EnReg), and Double Data Rate (DDR). However, there is no support for bidirectional I/Os or tristates with these standards.

LVDS

Low-Voltage Differential Signal (ANSI/TIA/EIA-644) is a high-speed differential I/O standard. It requires that one data bit be carried through two signal lines, so two pins are needed. It also requires external resistor termination.

The full implementation of the LVDS transmitter and receiver is shown in an example in Figure 2-134. The building blocks of the LVDS transmitter–receiver are one transmitter macro, one receiver macro, three board resistors at the transmitter end, and one resistor at the receiver end. The values for the three driver resistors are different from those used in the LVPECL implementation because the output standard specifications are different.

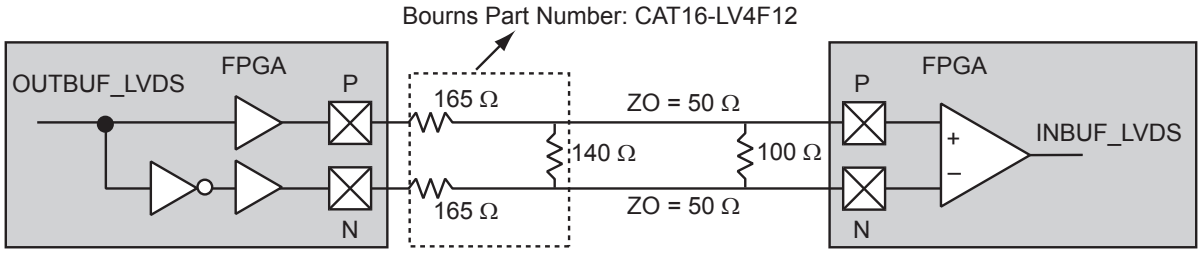

***Figure 2-134* • LVDS Circuit Diagram and Board-Level Implementation**

***Table 2-168* • Minimum and Maximum DC Input and Output Levels**

DC Parameter	Description	Min.	Typ.	Max.	Units
VCCI	Supply Voltage	2.375	2.5	2.625	V
VOL	Output Low Voltage	0.9	1.075	1.25	V
VOH	Input High Voltage	1.25	1.425	1.6	V
IOL [1]	Output Low Voltage	0.65	0.91	1.16	mA
IOH [1]	Output High Voltage	0.65	0.91	1.16	mA
VI	Input Voltage	0		2.925	V
IIL [2,3]	Input Low Voltage			10	µA
IIH [2,4]	Input High Voltage			10	µA
VODIFF	Differential Output Voltage	250	350	450	mV
VOCM	Output Common Mode Voltage	1.125	1.25	1.375	V
VICM	Input Common Mode Voltage	0.05	1.25	2.35	V
VIDIFF	Input Differential Voltage	100	350		mV

Notes:

1. *IOL/IOH defined by VODIFF/(Resistor Network)*
2. *Currents are measured at 85°C junction temperature.*
3. *IIL is the input leakage current per I/O pin over recommended operation conditions where –0.3 V < VIN < VIL.*
4. *IIH is the input leakage current per I/O pin over recommended operating conditions VIH < VIN < VCCI. Input current is larger when operating outside recommended ranges.*

$F_{DDRIMAX}$	Maximum Frequency for Input DDR	1404	1232	1048	MHz

Note: For the derating values at specific junction temperature and voltage supply levels, refer to Table 3-7 on page 3-9.

Table 3-8 • **AFS1500 Quiescent Supply Current Characteristics (continued)**

Parameter	Description	Conditions	Temp.	Min.	Typ.	Max.	Unit
IJTAG	JTAG I/O quiescent current	Operational standby[4], VJTAG = 3.63 V	T_J = 25°C		80	100	µA
			T_J = 85°C		80	100	µA
			T_J = 100°C		80	100	µA
		Standby mode[5] or Sleep mode[6], VJTAG = 0 V			0	0	µA
IPP	Programming supply current	Non-programming mode, VPUMP = 3.63 V	T_J = 25°C		39	80	µA
			T_J = 85°C		40	80	µA
			T_J = 100°C		40	80	µA
		Standby mode[5] or Sleep mode[6], VPUMP = 0 V			0	0	µA
ICCNVM	Embedded NVM current	Reset asserted, V_{CCNVM} = 1.575 V	T_J = 25°C		50	150	µA
			T_J =85°C		50	150	µA
			T_J = 100°C		50	150	µA
ICCPLL	1.5 V PLL quiescent current	Operational standby , VCCPLL = 1.575 V	T_J = 25°C		130	200	µA
			T_J = 85°C		130	200	µA
			T_J = 100°C		130	200	µA

Notes:

1. *ICC is the 1.5 V power supplies, ICC and ICC15A.*
2. *ICC33A includes ICC33A, ICC33PMP, and ICCOSC.*
3. *ICCI includes all ICCI0, ICCI1, ICCI2, and ICCI4.*
4. *Operational standby is when the Fusion device is powered up, all blocks are used, no I/O is toggling, Voltage Regulator is loaded with 200 mA, VCC33PMP is ON, XTAL is ON, and ADC is ON.*
5. *XTAL is configured as high gain, VCC = VJTAG = VPUMP = 0 V.*
6. *Sleep Mode, VCC = VJTAG = VPUMP = 0 V.*

Methodology

Total Power Consumption—P_{TOTAL}

Operating Mode, Standby Mode, and Sleep Mode

$P_{TOTAL} = P_{STAT} + P_{DYN}$

P_{STAT} is the total static power consumption.

P_{DYN} is the total dynamic power consumption.

Total Static Power Consumption—P_{STAT}

Operating Mode

$P_{STAT} = PDC1 + (N_{NVM\text{-}BLOCKS} * PDC4) + PDC5+ (N_{QUADS} * PDC6) + (N_{INPUTS} * PDC7) + (N_{OUTPUTS} * PDC8) + (N_{PLLS} * PDC9)$

$N_{NVM\text{-}BLOCKS}$ is the number of NVM blocks available in the device.

N_{QUADS} is the number of Analog Quads used in the design.

N_{INPUTS} is the number of I/O input buffers used in the design.

$N_{OUTPUTS}$ is the number of I/O output buffers used in the design.

N_{PLLS} is the number of PLLs available in the device.

Standby Mode

$P_{STAT} = PDC2$

Sleep Mode

$P_{STAT} = PDC3$

Total Dynamic Power Consumption—P_{DYN}

Operating Mode

$P_{DYN} = P_{CLOCK} + P_{S\text{-}CELL} + P_{C\text{-}CELL} + P_{NET} + P_{INPUTS} + P_{OUTPUTS} + P_{MEMORY} + P_{PLL} + P_{NVM} + P_{XTL\text{-}OSC} + P_{RC\text{-}OSC} + P_{AB}$

Standby Mode

$P_{DYN} = P_{XTL\text{-}OSC}$

Sleep Mode

$P_{DYN} = 0$ W

Global Clock Dynamic Contribution—P_{CLOCK}

Operating Mode

$P_{CLOCK} = (PAC1 + N_{SPINE} * PAC2 + N_{ROW} * PAC3 + N_{S\text{-}CELL} * PAC4) * F_{CLK}$

N_{SPINE} is the number of global spines used in the user design—guidelines are provided in the "Spine Architecture" section of the Global Resources chapter in the *Fusion and Extended Temperature Fusion FPGA Fabric User's Guide*.

N_{ROW} is the number of VersaTile rows used in the design—guidelines are provided in the "Spine Architecture" section of the Global Resources chapter in the *Fusion and Extended Temperature Fusion FPGA Fabric User's Guide*.

F_{CLK} is the global clock signal frequency.

$N_{S\text{-}CELL}$ is the number of VersaTiles used as sequential modules in the design.

Standby Mode and Sleep Mode

$P_{CLOCK} = 0$ W

Sequential Cells Dynamic Contribution—$P_{S\text{-}CELL}$

Operating Mode

Revision	Changes	Page
Revision 2 (continued)	A note was added to Figure 2-27 • Real-Time Counter System (not all the signals are shown for the AB macro) stating that the user is only required to instantiate the VRPSM macro if the user wishes to specify PUPO behavior of the voltage regulator to be different from the default, or employ user logic to shut the voltage regulator off (SAR 21773).	2-31
	VPUMP was incorrectly represented as VPP in several places. This was corrected to VPUMP in the "Standby and Sleep Mode Circuit Implementation" section and Table 3-8 • AFS1500 Quiescent Supply Current Characteristics through Table 3-11 • AFS090 Quiescent Supply Current Characteristics (21963).	2-32, 3-10
	Additional information was added to the Flash Memory Block "Write Operation" section, including an explanation of the fact that a copy-page operation takes no less than 55 cycles (SAR 26338).	2-45
	The "FlashROM" section was revised to refer to Figure 2-46 • FlashROM Timing Diagram and Table 2-26 • FlashROM Access Time rather than stating 20 MHz as the maximum FlashROM access clock and 10 ns as the time interval for D0 to become valid or invalid (SAR 22105).	2-53, 2-54
	The following figures were deleted (SAR 29991). Reference was made to a new application note, *Simultaneous Read-Write Operations in Dual-Port SRAM for Flash-Based cSoCs and FPGAs*, which covers these cases in detail (SAR 34862). Figure 2-55 • Write Access after Write onto Same Address Figure 2-56 • Read Access after Write onto Same Address Figure 2-57 • Write Access after Read onto Same Address The port names in the SRAM "Timing Waveforms", "Timing Characteristics", SRAM tables, Figure 2-55 • RAM Reset. Applicable to both RAM4K9 and RAM512x18., and the FIFO "Timing Characteristics" tables were revised to ensure consistency with the software names (SAR 35753).	2-63, 2-66, 2-65, 2-75
	In several places throughout the datasheet, GNDREF was corrected to ADCGNDREF (SAR 20783): Figure 2-64 • Analog Block Macro Table 2-36 • Analog Block Pin Description "ADC Operation" section	 2-77 2-78 2-104
	The following note was added below Figure 2-78 • Timing Diagram for the Temperature Monitor Strobe Signal: When the IEEE 1149.1 Boundary Scan EXTEST instruction is executed, the AG pad drive strength ceases and becomes a 1 µA sink into the Fusion device. (SAR 24796).	2-93
	The "Analog-to-Digital Converter Block" section was extensively revised, reorganizing the information and adding the "ADC Theory of Operation" section and "Acquisition Time or Sample Time Control" section. The "ADC Example" section was reworked and corrected (SAR 20577).	2-96
	Table 2-49 • Analog Channel Specifications was modified to include calibrated and uncalibrated values for offset (AFS090 and AFS250) for the external and internal temperature monitors. The "Offset" section was revised accordingly and now references Table 2-49 • Analog Channel Specifications (SARs 22647, 27015).	2-95, 2-117
	The "Intra-Conversion" section and "Injected Conversion" section had definitions incorrectly interchanged and have been corrected. Figure 2-92 • Intra-Conversion Timing Diagram and Figure 2-93 • Injected Conversion Timing Diagram were also incorrectly interchanged and have been replaced correctly. Reference in the figure notes to EQ 10 has been corrected to EQ 23 (SAR 20547).	2-110, 2-113, 2-113
