Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Not For New Designs
Core Processor	Coldfire V2
Core Size	32-Bit Single-Core
Speed	66MHz
Connectivity	I²C, SPI, UART/USART
Peripherals	DMA, LVD, POR, PWM, WDT
Number of I/O	55
Program Memory Size	256KB (256K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	32K x 8
Voltage - Supply (Vcc/Vdd)	3V ~ 3.6V
Data Converters	A/D 8x12b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	64-LQFP
Supplier Device Package	64-LQFP (10x10)
Purchase URL	https://www.e-xfl.com/product-detail/nxp-semiconductors/mcf5212cae66r

Table of Contents

List of Figures

List of Tables

  - Programmable center or left aligned outputs on individual channels
  - Four clock sources (A, B, SA, and SB) provide for a wide range of frequencies
  - Emergency shutdown
- Two periodic interrupt timers (PITs)
  - 16-bit counter
  - Selectable as free running or count down
- Software watchdog timer
  - 32-bit counter
  - Low-power mode support
- Clock generation features
  - One to 48 MHz crystal, 8 MHz on-chip relaxation oscillator, or external oscillator reference options
  - Trimmed relaxation oscillator
  - Two to 10 MHz reference frequency for normal PLL mode with a pre-divider programmable from 1 to 8
  - System can be clocked from PLL or directly from crystal oscillator or relaxation oscillator
  - Low power modes supported
  - 2^n ($n \leq 0 \leq 15$) low-power divider for extremely low frequency operation
- Interrupt controller
  - Uniquely programmable vectors for all interrupt sources
  - Fully programmable level and priority for all peripheral interrupt sources
  - Seven external interrupt signals with fixed level and priority
  - Unique vector number for each interrupt source
  - Ability to mask any individual interrupt source or all interrupt sources (global mask-all)
  - Support for hardware and software interrupt acknowledge (IACK) cycles
  - Combinatorial path to provide wake-up from low-power modes
- DMA controller
  - Four fully programmable channels
  - Dual-address transfer support with 8-, 16-, and 32-bit data capability, along with support for 16-byte (4×32-bit) burst transfers
  - Source/destination address pointers that can increment or remain constant
  - 24-bit byte transfer counter per channel
  - Auto-alignment transfers supported for efficient block movement
  - Bursting and cycle steal support
  - Software-programmable DMA requesters for the UARTs (3) and 32-bit timers (4)
- Reset
  - Separate reset in and reset out signals
  - Seven sources of reset:
    - Power-on reset (POR)
    - External
    - Software
    - Watchdog
    - Loss of clock
    - Loss of lock
    - Low-voltage detection (LVD)
  - Status flag indication of source of last reset
- Chip integration module (CIM)

1.1.4 JTAG

The MCF5213 supports circuit board test strategies based on the Test Technology Committee of IEEE and the Joint Test Action Group (JTAG). The test logic includes a test access port (TAP) consisting of a 16-state controller, an instruction register, and three test registers (a 1-bit bypass register, a 256-bit boundary-scan register, and a 32-bit ID register). The boundary scan register links the device's pins into one shift register. Test logic, implemented using static logic design, is independent of the device system logic.

The MCF5213 implementation can:

- Perform boundary-scan operations to test circuit board electrical continuity
- Sample MCF5213 system pins during operation and transparently shift out the result in the boundary scan register
- Bypass the MCF5213 for a given circuit board test by effectively reducing the boundary-scan register to a single bit
- Disable the output drive to pins during circuit-board testing
- Drive output pins to stable levels

1.1.5 On-Chip Memories

1.1.5.1 SRAM

The dual-ported SRAM module provides a general-purpose 32-Kbyte memory block that the ColdFire core can access in a single cycle. The location of the memory block can be set to any 32-Kbyte boundary within the 4-Gbyte address space. This memory is ideal for storing critical code or data structures and for use as the system stack. Because the SRAM module is physically connected to the processor's high-speed local bus, it can quickly service core-initiated accesses or memory-referencing commands from the debug module.

The SRAM module is also accessible by the DMA. The dual-ported nature of the SRAM makes it ideal for implementing applications with double-buffer schemes, where the processor and a DMA device operate in alternate regions of the SRAM to maximize system performance.

1.1.5.2 Flash Memory

The ColdFire flash module (CFM) is a non-volatile memory (NVM) module that connects to the processor's high-speed local bus. The CFM is constructed with four banks of 32-Kbyte×16-bit flash memory arrays to generate 256 Kbytes of 32-bit flash memory. These electrically erasable and programmable arrays serve as non-volatile program and data memory. The flash memory is ideal for program and data storage for single-chip applications, allowing for field reprogramming without requiring an external high voltage source. The CFM interfaces to the ColdFire core through an optimized read-only memory controller that supports interleaved accesses from the 2-cycle flash memory arrays. A backdoor mapping of the flash memory is used for all program, erase, and verify operations, as well as providing a read datapath for the DMA. Flash memory may also be programmed via the EzPort, which is a serial flash memory programming interface that allows the flash memory to be read, erased and programmed by an external controller in a format compatible with most SPI bus flash memory chips.

1.1.6 Power Management

The MCF5213 incorporates several low-power modes of operation entered under program control and exited by several external trigger events. An integrated power-on reset (POR) circuit monitors the input supply and forces an MCU reset as the supply voltage rises. The low voltage detector (LVD) monitors the supply voltage and is configurable to force a reset or interrupt condition if it falls below the LVD trip point. The RAM standby switch provides power to RAM when the supply voltage to the chip falls below the standby battery voltage.

1.1.7 FlexCAN

The FlexCAN module is a communication controller implementing version 2.0 of the CAN protocol parts A and B. The CAN protocol can be used as an industrial control serial data bus, meeting the specific requirements of reliable operation in a harsh EMI environment with high bandwidth. This instantiation of FlexCAN has 16 message buffers.

1.1.8 UARTs

The MCF5213 has three full-duplex UARTs that function independently. The three UARTs can be clocked by the system bus clock, eliminating the need for an external clock source. On smaller packages, the third UART is multiplexed with other digital I/O functions.

1.1.9 I^2C Bus

The I^2C bus is a two-wire, bidirectional serial bus that provides a simple, efficient method of data exchange and minimizes the interconnection between devices. This bus is suitable for applications requiring occasional communications over a short distance between many devices.

1.1.10 QSPI

The queued serial peripheral interface (QSPI) provides a synchronous serial peripheral interface with queued transfer capability. It allows up to 16 transfers to be queued at once, minimizing the need for CPU intervention between transfers.

1.1.11 Fast ADC

The fast ADC consists of an eight-channel input select multiplexer and two independent sample and hold (S/H) circuits feeding separate 12-bit ADCs. The two separate converters store their results in accessible buffers for further processing.

The ADC can be configured to perform a single scan and halt, a scan when triggered, or a programmed scan sequence repeatedly until manually stopped.

The ADC can be configured for sequential or simultaneous conversion. When configured for sequential conversions, up to eight channels can be sampled and stored in any order specified by the channel list register. Both ADCs may be required during a scan, depending on the inputs to be sampled.

During a simultaneous conversion, both S/H circuits are used to capture two different channels at the same time. This configuration requires that a single channel may not be sampled by both S/H circuits simultaneously.

Optional interrupts can be generated at the end of the scan sequence if a channel is out of range (measures below the low threshold limit or above the high threshold limit set in the limit registers) or at several different zero crossing conditions.

1.1.12 DMA Timers (DTIM0–DTIM3)

There are four independent, DMA transfer capable 32-bit timers (DTIM0, DTIM1, DTIM2, and DTIM3) on the MCF5213. Each module incorporates a 32-bit timer with a separate register set for configuration and control. The timers can be configured to operate from the system clock or from an external clock source using one of the DTIN*n* signals. If the system clock is selected, it can be divided by 16 or 1. The input clock is further divided by a user-programmable 8-bit prescaler that clocks the actual timer counter register (TCR*n*). Each of these timers can be configured for input capture or reference (output) compare mode. Timer events may optionally cause interrupt requests or DMA transfers.

1.1.20 Reset

The reset controller determines the source of reset, asserts the appropriate reset signals to the system, and keeps track of what caused the last reset. There are seven sources of reset:

- External reset input
- Power-on reset (POR)
- Watchdog timer
- Phase locked-loop (PLL) loss of lock
- PLL loss of clock
- Software
- Low-voltage detector (LVD)

Control of the LVD and its associated reset and interrupt are managed by the reset controller. Other registers provide status flags indicating the last source of reset and a control bit for software assertion of the $\overline{\text{RSTO}}$ pin.

1.1.21 GPIO

Nearly all pins on the MCF5213 have general purpose I/O capability and are grouped into 8-bit ports. Some ports do not use all eight bits. Each port has registers that configure, monitor, and control the port pins.

1.1.22 Part Numbers and Packaging

This product is RoHS-compliant. Refer to the product page at freescale.com or contact your sales office for up-to-date RoHS information.

Table 2. Orderable Part Number Summary

Freescale Part Number	Description	Speed	Package	Temperature
MCF5211CAE66	MCF5211 ColdFire Microcontroller	66 MHz	64 LQFP	-40 to +85 °C
MCF5211CEP66	MCF5211 ColdFire Microcontroller, FlexCAN	66 MHz	64 QFN	-40 to +85 °C
MCF5211LCEP66	MCF5211 ColdFire Microcontroller	66 MHz	64 QFN	-40 to +85 °C

Table 16. Debug Support Signals (continued)

Signal Name	Abbreviation	Function	I/O
Development Serial Input	DSI	Development Serial Input - Internally synchronized input that provides data input for the serial communication port to the debug module, after the DSCLK has been seen as high (logic 1).	I
Development Serial Output	DSO	Development Serial Output - Provides serial output communication for debug module responses. DSO is registered internally. The output is delayed from the validation of DSCLK high.	O
Debug Data	DDATA[3:0]	Display captured processor data and breakpoint status. The CLKOUT signal can be used by the development system to know when to sample DDATA[3:0].	O
Processor Status Clock	PSTCLK	Processor Status Clock - Delayed version of the processor clock. Its rising edge appears in the center of valid PST and DDATA output. PSTCLK indicates when the development system should sample PST and DDATA values. If real-time trace is not used, setting CSR[PCD] keeps PSTCLK, and PST and DDATA outputs from toggling without disabling triggers. Non-quiescent operation can be reenabled by clearing CSR[PCD], although the external development systems must resynchronize with the PST and DDATA outputs. PSTCLK starts clocking only when the first non-zero PST value (0xC, 0xD, or 0xF) occurs during system reset exception processing.	O
Processor Status Outputs	PST[3:0]	Indicate core status. Debug mode timing is synchronous with the processor clock; status is unrelated to the current bus transfer. The CLKOUT signal can be used by the development system to know when to sample PST[3:0].	O
All Processor Status Outputs	ALLPST	Logical AND of PST[3:0]. The CLKOUT signal can be used by the development system to know when to sample ALLPST.	O

1.14 EzPort Signal Descriptions

Table contains a list of EzPort external signals.

Table 17. EzPort Signal Descriptions

Signal Name	Abbreviation	Function	I/O
EzPort Clock	EZPCK	Shift clock for EzPort transfers.	I
EzPort Chip Select	EZPCS	Chip select for signalling the start and end of serial transfers.	I
EzPort Serial Data In	EZPD	EZPD is sampled on the rising edge of EZPCK.	I
EzPort Serial Data Out	EZPQ	EZPQ transitions on the falling edge of EZPCK.	O

2.1 Maximum Ratings

Table 19. Absolute Maximum Ratings[1, 2]

Rating	Symbol	Value	Unit
Supply voltage	V_{DD}	–0.3 to +4.0	V
Clock synthesizer supply voltage	V_{DDPLL}	–0.3 to +4.0	V
RAM standby supply voltage	V_{STBY}	–0.3 to +4.0	V
Digital input voltage [3]	V_{IN}	–0.3 to +4.0	V
EXTAL pin voltage	V_{EXTAL}	0 to 3.3	V
XTAL pin voltage	V_{XTAL}	0 to 3.3	V
Instantaneous maximum current Single pin limit (applies to all pins)[4, 5]	I_{DD}	25	mA
Operating temperature range (packaged)	T_A (T_L - T_H)	–40 to 85	°C
Storage temperature range	T_{stg}	–65 to 150	°C

1 Functional operating conditions are given in DC Electrical Specifications. Absolute Maximum Ratings are stress ratings only, and functional operation at the maxima is not guaranteed. Stress beyond those listed may affect device reliability or cause permanent damage to the device.

2 This device contains circuitry protecting against damage due to high static voltage or electrical fields; however, it is advised that normal precautions be taken to avoid application of any voltages higher than maximum-rated voltages to this high-impedance circuit. Reliability of operation is enhanced if unused inputs are tied to an appropriate logic voltage level (V_{SS} or V_{DD}).

3 Input must be current limited to the I_{DD} value specified. To determine the value of the required current-limiting resistor, calculate resistance values for positive and negative clamp voltages, then use the larger of the two values.

4 All functional non-supply pins are internally clamped to V_{SS} and V_{DD}.

5 The power supply must maintain regulation within operating V_{DD} range during instantaneous and operating maximum current conditions. If positive injection current ($V_{in} > V_{DD}$) is greater than I_{DD}, the injection current may flow out of V_{DD} and could result in the external power supply going out of regulation. Ensure that the external V_{DD} load shunts current greater than maximum injection current. This is the greatest risk when the MCU is not consuming power (e.g., no clock).

2.2 Current Consumption

Table 20. Current Consumption in Low-Power Mode[1,2]

Mode	8MHz (Typ)[3]	16MHz (Typ)[2]	64MHz (Typ)[2]	80MHz (Typ)[2]	Units
Stop mode 3 (Stop 11)[4]	0.13				mA
Stop mode 2 (Stop 10)[4]	2.29				
Stop mode 1 (Stop 01)[4,5]	2.80	3.08	4.76	5.38	
Stop mode 0 (Stop 00)[4]	2.80	3.08	4.76	5.39	
Wait / Doze	11.12	20.23	30.17	33.36	
Run	12.40	22.74	39.92	45.47	

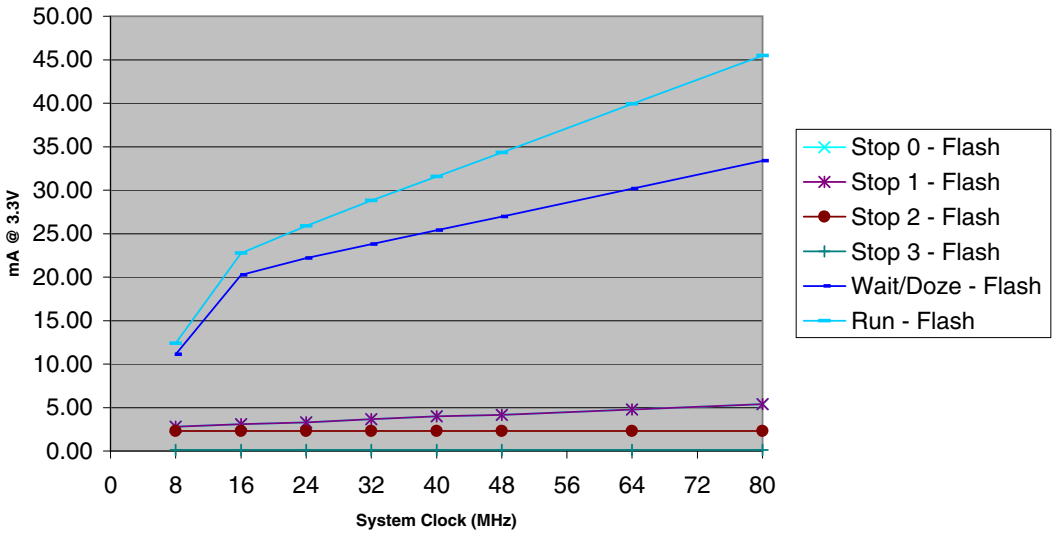
1 All values are measured with a 3.30 V power supply

2 Refer to the Power Management chapter in the MCF5213 Reference Manual for more information on low-power modes.

3 CLKOUT and all peripheral clocks except UART0 and CFM off before entering low power mode. CLKOUT is disabled. All code executed from flash memory. Code run from SRAM reduces power consumption further. Tests performed at room temperature.

4 See the description of the Low-Power Control Register (LPCR) in the MCF5213 Reference Manual for more information on stop modes 0–3.

5 Results are identical to STOP 00 for typical values because they only differ by CLKOUT power consumption. CLKOUT is already disabled in this instance prior to entering low power mode.



Typical Current Consumption in Low-Power Modes

Table 21. Typical Active Current Consumption Specifications

Characteristic	Symbol	Typical[1] Active (SRAM)	Typical[1] Active (Flash)	Peak[2]	Unit
1 MHz core & I/O	I_{DD}	—	3.48	—	mA
8 MHz core & I/O		7.28	13.37	19.02	
16 MHz core & I/O		12.08	25.08	35.66	
64 MHz core & I/O		40.14	54.62	85.01	
80 MHz core & I/O		49.2	64.09	100.03	
RAM standby supply current • Normal operation: $V_{DD} > V_{STBY} - 0.3$ V • Transient condition: $V_{STBY} - 0.3$ V > $V_{DD} > V_{SS} + 0.5$ V • Standby operation: $V_{DD} < V_{SS} + 0.5$ V	I_{STBY}	N/A[3] N/A[3] N/A[3]		N/A[3] N/A[3] N/A[3]	µA mA µA
Analog supply current • Normal operation • Low-power stop	I_{DDA}	— —	— —	16 50	mA µA

1 Tested at room temperature with CPU polling a status register. All clocks were off except the UART and CFM (when running from flash memory).

2 Peak current measured with all modules active, and default drive strength with matching load.

3 Due to the errata “Non-functional RAM Standby Supply” in the *MCF5213 Device Errata*, V_{STBY} should be connected directly to V_{DD} and cannot be used for RAM standby operation.

2.3 Thermal Characteristics

Table 22 lists thermal resistance values.

Table 22. Thermal Characteristics

	Characteristic		Symbol	Value	Unit
100 LQFP	Junction to ambient, natural convection	Single layer board (1s)	θ_{JA}	53[1,2]	°C/W
	Junction to ambient, natural convection	Four layer board (2s2p)	θ_{JA}	39[1,3]	°C/W
	Junction to ambient, (@200 ft/min)	Single layer board (1s)	θ_{JMA}	42[1,3]	°C/W
	Junction to ambient, (@200 ft/min)	Four layer board (2s2p)	θ_{JMA}	33[1,3]	°C/W
	Junction to board	—	θ_{JB}	25[4]	°C/W
	Junction to case	—	θ_{JC}	9[5]	°C/W
	Junction to top of package	Natural convection	Ψ_{jt}	2[6]	°C/W
	Maximum operating junction temperature	—	T_j	105	°C

The average chip-junction temperature (T_J) in °C can be obtained from:

$$T_J = T_A + (P_D \times \Theta_{JMA}) \quad (1)$$

Where:

T_A = ambient temperature, °C

Θ_{JA} = package thermal resistance, junction-to-ambient, °C/W

P_D = $P_{INT} + P_{I/O}$

P_{INT} = chip internal power, $I_{DD} \times V_{DD}$, watts

$P_{I/O}$ = power dissipation on input and output pins — user determined, watts

For most applications $P_{I/O} < P_{INT}$ and can be ignored. An approximate relationship between P_D and T_J (if $P_{I/O}$ is neglected) is:

$$P_D = K \div (T_J + 273°C) \quad (2)$$

Solving equations 1 and 2 for K gives:

$$K = P_D \times (T_A + 273\ °C) + \Theta_{JMA} \times P_D^2 \quad (3)$$

where K is a constant pertaining to the particular part. K can be determined from equation (3) by measuring P_D (at equilibrium) for a known T_A. Using this value of K, the values of P_D and T_J can be obtained by solving equations (1) and (2) iteratively for any value of T_A.

2.4 Flash Memory Characteristics

The flash memory characteristics are shown in Table 23 and Table 24.

Table 23. SGFM Flash Program and Erase Characteristics

(V_{DDF} = 2.7 to 3.6 V)

Parameter	Symbol	Min	Typ	Max	Unit
System clock (read only)	$f_{sys(R)}$	0	—	66.67 or 80[1]	MHz
System clock (program/erase)[2]	$f_{sys(P/E)}$	0.15	—	66.67 or 80[1]	MHz

1 Depending on packaging; see Table 2.

2 Refer to the flash memory section for more information

Table 24. SGFM Flash Module Life Characteristics

(V_{DDF} = 2.7 to 3.6 V)

Parameter	Symbol	Value	Unit
Maximum number of guaranteed program/erase cycles[1] before failure	P/E	10,000[2]	Cycles
Data retention at average operating temperature of 85°C	Retention	10	Years

1 A program/erase cycle is defined as switching the bits from 1 → 0 → 1.

2 Reprogramming of a flash memory array block prior to erase is not required.

Table 26. DC Electrical Specifications (continued)[1]

Characteristic	Symbol	Min	Max	Unit
Output high voltage (high drive) I_{OH} = -5 mA	V_{OH}	V_{DD} – 0.5	—	V
Output low voltage (high drive) I_{OL} = 5 mA	V_{OL}	—	0.5	V
Output high voltage (low drive) I_{OH} = -2 mA	V_{OH}	V_{DD} - 0.5	—	V
Output low voltage (low drive) I_{OL} = 2 mA	V_{OL}	—	0.5	V
Weak internal pull Up device current, tested at V_{IL} Max.[2]	I_{APU}	–10	–130	µA
Input Capacitance [3] • All input-only pins • All input/output (three-state) pins	C_{in}	 — —	 7 7	pF

1 Refer to Table 27 for additional PLL specifications.

2 Refer to Table 3 for pins having internal pull-up devices.

3 This parameter is characterized before qualification rather than 100% tested.

2.7 Clock Source Electrical Specifications

Table 27. PLL Electrical Specifications

(V_{DD} and V_{DDPLL} = 2.7 to 3.6 V, V_{SS} = V_{SSPLL} = 0 V)

Characteristic	Symbol	Min	Max	Unit
PLL reference frequency range • Crystal reference • External reference	 $f_{ref\_crystal}$ f_{ref_ext}	 2 2	 10.0 10.0	MHz
System frequency [1] • External clock mode • On-chip PLL frequency	f_{sys}	 0 f_{ref} / 32	 66.67 or 80[2] 66.67 or 80[2]	MHz
Loss of reference frequency [3, 5]	f_{LOR}	100	1000	kHz
Self clocked mode frequency [4]	f_{SCM}	1	5	MHz
Crystal start-up time [5, 6]	t_{cst}	—	10	ms
EXTAL input high voltage • External reference	V_{IHEXT}	 2.0	 V_{DD}	V
EXTAL input low voltage • External reference	V_{ILEXT}	 V_{SS}	 0.8	V
PLL lock time[4,7]	t_{lpll}	—	500	µs
Duty cycle of reference [4]	t_{dc}	40	60	% f_{ref}

2.10 I²C Input/Output Timing Specifications

Table 30 lists specifications for the I²C input timing parameters shown in Figure 7.

Table 30. I²C Input Timing Specifications between I2C_SCL and I2C_SDA

Num	Characteristic	Min	Max	Units
I1	Start condition hold time	$2 \times t_{CYC}$	—	ns
I2	Clock low period	$8 \times t_{CYC}$	—	ns
I3	SCL/SDA rise time (V_{IL} = 0.5 V to V_{IH} = 2.4 V)	—	1	ms
I4	Data hold time	0	—	ns
I5	SCL/SDA fall time (V_{IH} = 2.4 V to V_{IL} = 0.5 V)	—	1	ms
I6	Clock high time	$4 \times t_{CYC}$	—	ns
I7	Data setup time	0	—	ns
I8	Start condition setup time (for repeated start condition only)	$2 \times t_{CYC}$	—	ns
I9	Stop condition setup time	$2 \times t_{CYC}$	—	ns

Table 31 lists specifications for the I²C output timing parameters shown in Figure 7.

Table 31. I²C Output Timing Specifications between I2C_SCL and I2C_SDA

Num	Characteristic	Min	Max	Units
I1[1]	Start condition hold time	$6 \times t_{CYC}$	—	ns
I2[1]	Clock low period	$10 \times t_{CYC}$	—	ns
I3[2]	I2C_SCL/I2C_SDA rise time (V_{IL} = 0.5 V to V_{IH} = 2.4 V)	—	—	µs
I4[1]	Data hold time	$7 \times t_{CYC}$	—	ns
I5[3]	I2C_SCL/I2C_SDA fall time (V_{IH} = 2.4 V to V_{IL} = 0.5 V)	—	3	ns
I6[1]	Clock high time	$10 \times t_{CYC}$	—	ns
I7[1]	Data setup time	$2 \times t_{CYC}$	—	ns
I8[1]	Start condition setup time (for repeated start condition only)	$20 \times t_{CYC}$	—	ns
I9[1]	Stop condition setup time	$10 \times t_{CYC}$	—	ns

1 Output numbers depend on the value programmed into the IFDR; an IFDR programmed with the maximum frequency (IFDR = 0x20) results in minimum output timings as shown in Table 31. The I²C interface is designed to scale the actual data transition time to move it to the middle of the SCL low period. The actual position is affected by the prescale and division values programmed into the IFDR; however, the numbers given in Table 31 are minimum values.

2 Because SCL and SDA are open-collector-type outputs, which the processor can only actively drive low, the time SCL or SDA take to reach a high level depends on external signal capacitance and pull-up resistor values.

3 Specified at a nominal 50-pF load.

2.15 JTAG and Boundary Scan Timing

Table 35. JTAG and Boundary Scan Timing

Num	Characteristics[1]	Symbol	Min	Max	Unit
J1	TCLK frequency of operation	f_{JCYC}	DC	1/4	$f_{sys/2}$
J2	TCLK cycle period	t_{JCYC}	$4 \times t_{CYC}$	—	ns
J3	TCLK clock pulse width	t_{JCW}	26	—	ns
J4	TCLK rise and fall times	t_{JCRF}	0	3	ns
J5	Boundary scan input data setup time to TCLK rise	t_{BSDST}	4	—	ns
J6	Boundary scan input data hold time after TCLK rise	t_{BSDHT}	26	—	ns
J7	TCLK low to boundary scan output data valid	t_{BSDV}	0	33	ns
J8	TCLK low to boundary scan output high Z	t_{BSDZ}	0	33	ns
J9	TMS, TDI input data setup time to TCLK rise	t_{TAPBST}	4	—	ns
J10	TMS, TDI Input data hold time after TCLK rise	t_{TAPBHT}	10	—	ns
J11	TCLK low to TDO data valid	t_{TDODV}	0	26	ns
J12	TCLK low to TDO high Z	t_{TDODZ}	0	8	ns
J13	$\overline{\text{TRST}}$ assert time	t_{TRSTAT}	100	—	ns
J14	$\overline{\text{TRST}}$ setup time (negation) to TCLK high	t_{TRSTST}	10	—	ns

1 JTAG_EN is expected to be a static signal. Hence, it is not associated with any timing.

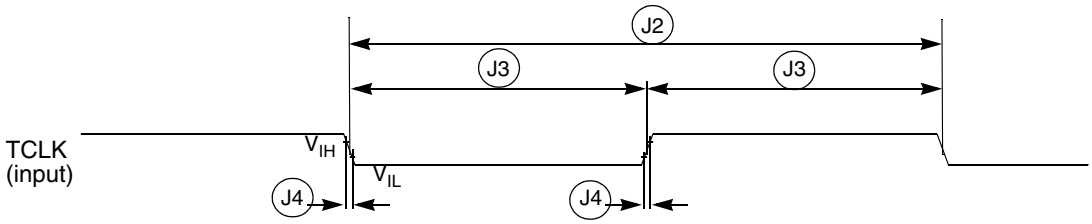


Figure 10. Test Clock Input Timing

Figure 15 shows BDM serial port AC timing for the values in Table 36.

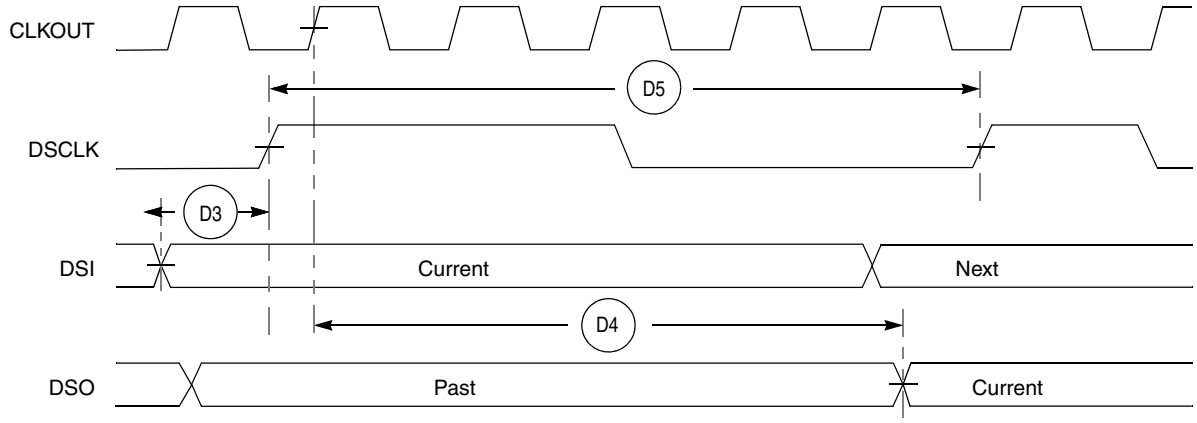

Figure 15. BDM Serial Port AC Timing

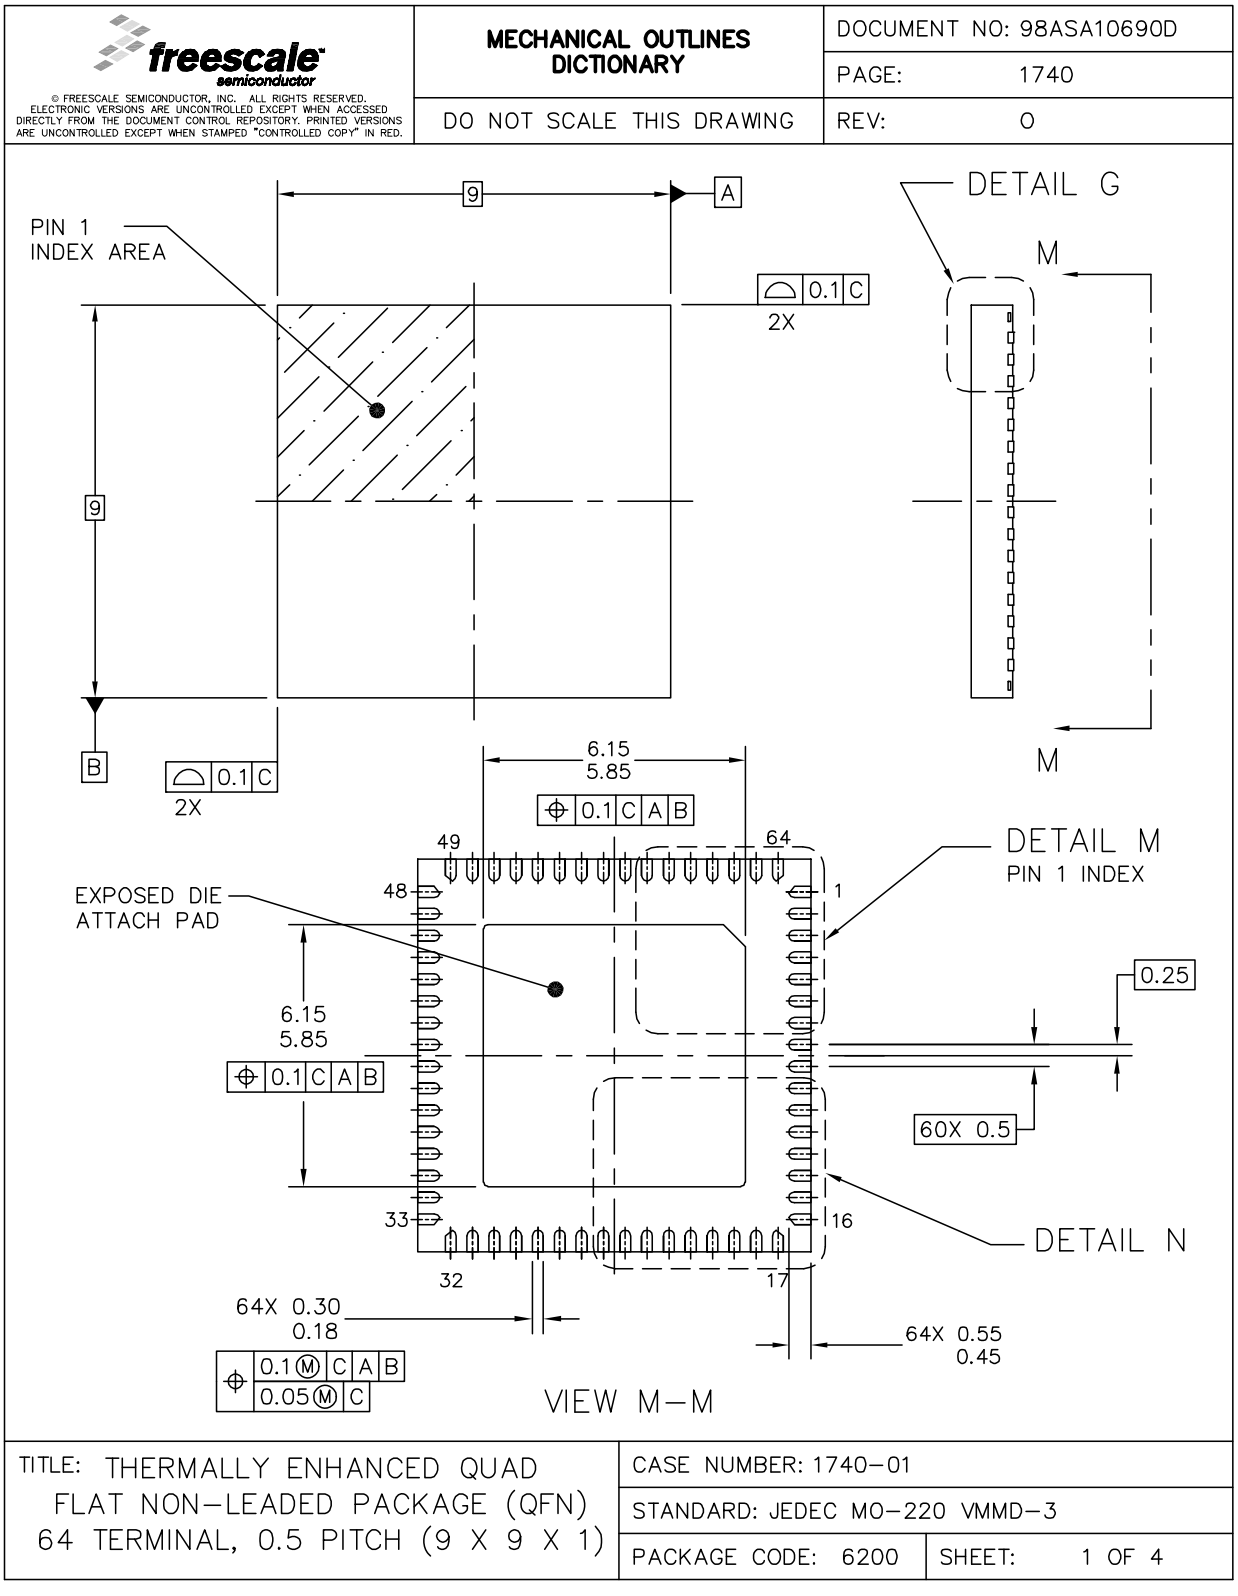
3.2 64 QFN Package



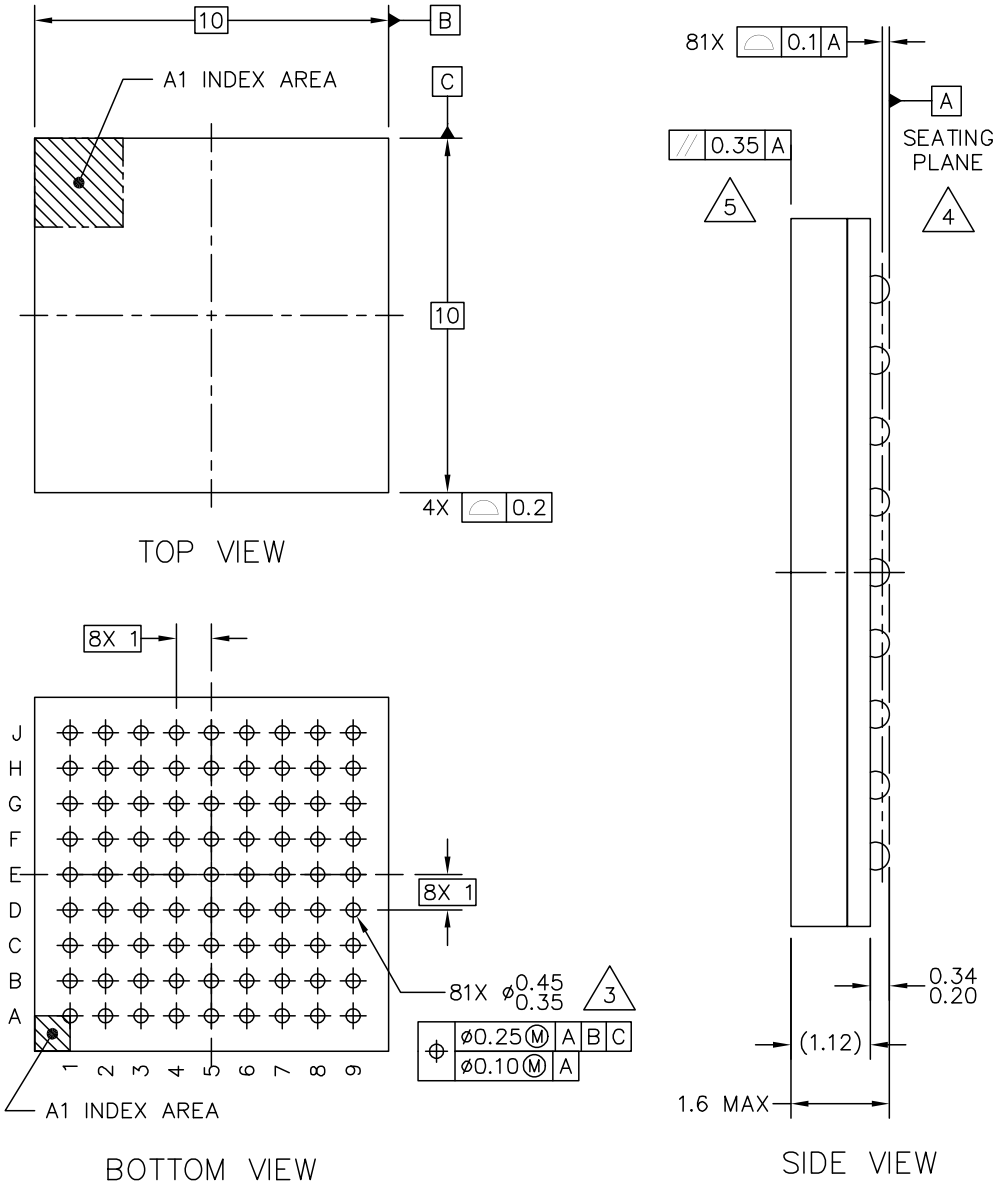
freescale semiconductor	MECHANICAL OUTLINES DICTIONARY	DOCUMENT NO: 98ASA10690D
		PAGE: 1740
	DO NOT SCALE THIS DRAWING	REV: O

NOTES:

1. ALL DIMENSIONS ARE IN MILLIMETERS.
2. INTERPRET DIMENSIONS AND TOLERANCES PER ASME Y14.5M–1994.
3. THE COMPLETE JEDEC DESIGNATOR FOR THIS PACKAGE IS: HF–PQFN.
4. COPLANARITY APPLIES TO LEADS, CORNER LEADS AND DIE ATTACH PAD.
5. MIN METAL GAP SHOULD BE 0.2MM.

TITLE: THERMALLY ENHANCED QUAD FLAT NON–LEADED PACKAGE (QFN) 64 TERMINAL, 0.5 PITCH (9 X 9 X 1)	CASE NUMBER: 1740–01	
	STANDARD: JEDEC MO–220 VMMD–3	
	PACKAGE CODE: 6200	SHEET: 3 OF 4

3.3 81 MAPBGA Package



© FREESCALE SEMICONDUCTOR, INC. ALL RIGHTS RESERVED.	MECHANICAL OUTLINE	PRINT VERSION NOT TO SCALE
TITLE: PBGA, LOW PROFILE, 81 I/O, 10 X 10 PKG, 1 MM PITCH (MAP)	DOCUMENT NO: 98ASA10670D	REV: O
	CASE NUMBER: 1662–01	04 FEB 2005
	STANDARD: NON–JEDEC
