

Welcome to [E-XFL.COM](http://E-XFL.COM)

### What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

### Applications of "[Embedded - Microcontrollers](#)"

#### Details

Product Status	Active
Core Processor	PIC
Core Size	8-Bit
Speed	40MHz
Connectivity	I <sup>2</sup> C, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, HLVD, POR, PWM, WDT
Number of I/O	36
Program Memory Size	4KB (2K x 16)
Program Memory Type	FLASH
EEPROM Size	256 x 8
RAM Size	512 x 8
Voltage - Supply (Vcc/Vdd)	4.2V ~ 5.5V
Data Converters	A/D 13x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Through Hole
Package / Case	40-DIP (0.600", 15.24mm)
Supplier Device Package	40-PDIP
Purchase URL	<a href="https://www.e-xfl.com/product-detail/microchip-technology/pic18f4221-i-p">https://www.e-xfl.com/product-detail/microchip-technology/pic18f4221-i-p</a>

# PIC18F2221/2321/4221/4321 FAMILY

**TABLE 6-2: REGISTER FILE SUMMARY (PIC18F2221/2321/4221/4321) (CONTINUED)**

File Name	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Value on POR, BOR	Details on page:

**Legend:** x = unknown, u = unchanged, - = unimplemented, q = value depends on condition

**Note 1:** The SBOREN bit is only available when the BOREN<1:0> Configuration bits = 01; otherwise, it is disabled and reads as '0'. See **Section 5.4 "Brown-out Reset (BOR)"**.

**2:** These registers and/or bits are not implemented on 28-pin devices and are read as '0'. Reset values are shown for 40/44-pin devices; individual unimplemented bits should be interpreted as '-'.  
**3:** The PLEN bit is only available in specific oscillator configurations; otherwise, it is disabled and reads as '0'. See **Section 3.6.4 "PLL in INTOSC Modes"**.

**4:** The RE3 bit is only available when Master Clear Reset is disabled (MCLRE Configuration bit = 0); otherwise, RE3 reads as '0'. This bit is read-only.  
**5:** RA6/RA7 and their associated latch and direction bits are individually configured as port pins based on various primary oscillator modes. When disabled, these bits read as '0'.  
**6:** Bit 7 and bit 6 are cleared by user software or by a POR.

# PIC18F2221/2321/4221/4321 FAMILY

## 6.3.5 STATUS REGISTER

The STATUS register, shown in Register 6-2, contains the arithmetic status of the ALU. As with any other SFR, it can be the operand for any instruction.

If the STATUS register is the destination for an instruction that affects the Z, DC, C, OV or N bits, the results of the instruction are not written; instead, the STATUS register is updated according to the instruction performed. Therefore, the result of an instruction with the STATUS register as its destination may be different than intended. As an example, `CLRF STATUS` will set the Z bit and leave the remaining Status bits unchanged ('000u u1uu').

It is recommended that only `BCF`, `BSF`, `SWAPF`, `MOVFF` and `MOVWF` instructions are used to alter the STATUS register, because these instructions do not affect the Z, C, DC, OV or N bits in the STATUS register.

For other instructions that do not affect Status bits, see the instruction set summaries in Table 24-2 and Table 24-3.

**Note:** The C and DC bits operate as the borrow and digit borrow bits, respectively, in subtraction.

### REGISTER 6-2: STATUS REGISTER

U-0	U-0	U-0	R/W-x	R/W-x	R/W-x	R/W-x	R/W-x	
—	—	—	N	OV	Z	DC	C	
bit 7								bit 0

bit 7-5 **Unimplemented:** Read as '0'

bit 4 **N:** Negative bit

This bit is used for signed arithmetic (2's complement). It indicates whether the result was negative (ALU MSB = 1).

- 1 = Result was negative
- 0 = Result was positive

bit 3 **OV:** Overflow bit

This bit is used for signed arithmetic (2's complement). It indicates an overflow of the 7-bit magnitude which causes the sign bit (bit 7 of the result) to change state.

- 1 = Overflow occurred for signed arithmetic (in this arithmetic operation)
- 0 = No overflow occurred

bit 2 **Z:** Zero bit

- 1 = The result of an arithmetic or logic operation is zero
- 0 = The result of an arithmetic or logic operation is not zero

bit 1 **DC:** Digit Carry/borrow bit

For `ADDWF`, `ADDLW`, `SUBLW` and `SUBWF` instructions:

- 1 = A carry-out from the 4th low-order bit of the result occurred
- 0 = No carry-out from the 4th low-order bit of the result

**Note:** For borrow, the polarity is reversed. A subtraction is executed by adding the 2's complement of the second operand. For rotate (`RRF`, `RLF`) instructions, this bit is loaded with either bit 4 or bit 3 of the source register.

bit 0 **C:** Carry/borrow bit

For `ADDWF`, `ADDLW`, `SUBLW` and `SUBWF` instructions:

- 1 = A carry-out from the Most Significant bit of the result occurred
- 0 = No carry-out from the Most Significant bit of the result occurred

**Note:** For borrow, the polarity is reversed. A subtraction is executed by adding the 2's complement of the second operand. For rotate (`RRF`, `RLF`) instructions, this bit is loaded with either the high or low-order bit of the source register.

#### Legend:

R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared    x = Bit is unknown

# PIC18F2221/2321/4221/4321 FAMILY

## 6.4.3.1 FSR Registers and the INDF Operand

At the core of indirect addressing are three sets of registers: FSR0, FSR1 and FSR2. Each represents a pair of 8-bit registers, FSRnH and FSRnL. The four upper bits of the FSRnH register are not used so each FSR pair holds a 12-bit value. This represents a value that can address the entire range of the data memory in a linear fashion. The FSR register pairs, then, serve as pointers to data memory locations.

Indirect addressing is accomplished with a set of Indirect File Operands, INDF0 through INDF2. These can be thought of as “virtual” registers: they are mapped in the SFR space but are not physically implemented. Reading or writing to a particular INDF register actually accesses its corresponding FSR register pair. A read from INDF1, for example, reads the data at the address indicated by FSR1H:FSR1L. Instructions that use the INDF registers as operands actually use the contents of their corresponding FSR as a pointer to the instruction’s target. The INDF operand is just a convenient way of using the pointer.

Because indirect addressing uses a full 12-bit address, data RAM banking is not necessary. Thus, the current contents of the BSR and the Access RAM bit have no effect on determining the target address.

## 6.4.3.2 FSR Registers and POSTINC, POSTDEC, PREINC and PLUSW

In addition to the INDF operand, each FSR register pair also has four additional indirect operands. Like INDF, these are “virtual” registers that cannot be indirectly read or written to. Accessing these registers actually accesses the associated FSR register pair, but also performs a specific action on its stored value. They are:

- POSTDEC: accesses the FSR value, then automatically decrements it by 1 afterwards
- POSTINC: accesses the FSR value, then automatically increments it by 1 afterwards
- PREINC: increments the FSR value by 1, then uses it in the operation
- PLUSW: adds the signed value of the W register (range of -127 to 128) to that of the FSR and uses the new value in the operation.

In this context, accessing an INDF register uses the value in the FSR registers without changing them. Similarly, accessing a PLUSW register gives the FSR value offset by that in the W register; neither value is actually changed in the operation. Accessing the other virtual registers changes the value of the FSR registers.

Operations on the FSRs with POSTDEC, POSTINC and PREINC affect the entire register pair; that is, roll-overs of the FSRnL register from FFh to 00h carry over to the FSRnH register. On the other hand, results of these operations do not change the value of any flags in the STATUS register (e.g., Z, N, OV, etc.).

**Note 1:** These bits are unimplemented on 28-pin devices and read as '0'.

# PIC18F2221/2321/4221/4321 FAMILY

## 18.3.2 OPERATION

When initializing the SPI, several options need to be specified. This is done by programming the appropriate control bits (SSPCON1<5:0> and SSPSTAT<7:6>). These control bits allow the following to be specified:

- Master mode (SCK is the clock output)
- Slave mode (SCK is the clock input)
- Clock Polarity (Idle state of SCK)
- Data Input Sample Phase (middle or end of data output time)
- Clock Edge (output data on rising/falling edge of SCK)
- Clock Rate (Master mode only)
- Slave Select mode (Slave mode only)

The MSSP consists of a transmit/receive shift register (SSPSR) and a buffer register (SSPBUF). The SSPSR shifts the data in and out of the device, MSb first. The SSPBUF holds the data that was written to the SSPSR until the received data is ready. Once the 8 bits of data have been received, that byte is moved to the SSPBUF register. Then, the Buffer Full detect bit, BF (SSPSTAT<0>), and the interrupt flag bit, SSPIF, are set. This double-buffering of the received data (SSPBUF) allows the next byte to start reception before reading the data that was just received. Any write to the SSPBUF register during transmission/reception of data will be ignored and the write collision detect bit, WCOL

(SSPCON1<7>), will be set. User software must clear the WCOL bit so that it can be determined if the following write(s) to the SSPBUF register completed successfully.

When the application software is expecting to receive valid data, the SSPBUF should be read before the next byte of data to transfer is written to the SSPBUF. The Buffer Full bit, BF (SSPSTAT<0>), indicates when SSPBUF has been loaded with the received data (transmission is complete). When the SSPBUF is read, the BF bit is cleared. This data may be irrelevant if the SPI is only a transmitter. Generally, the MSSP interrupt is used to determine when the transmission/reception has completed. The SSPBUF must be read and/or written. If the interrupt method is not going to be used, then software polling can be done to ensure that a write collision does not occur. Example 18-1 shows the loading of the SSPBUF (SSPSR) for data transmission.

The SSPSR is not directly readable or writable and can only be accessed by addressing the SSPBUF register. Additionally, the MSSP Status register (SSPSTAT) indicates the various status conditions.

**Note:** To avoid lost data in Master mode, a read of the SSPBUF must be performed to clear the Buffer Full (BF) detect bit (SSPSTAT<0>) between each transmission.

**Note:** The SSPBUF register cannot be used with read-modify-write instructions, such as BCF, BTFSC and COMF, etc.

### EXAMPLE 18-1: LOADING THE SSPBUF (SSPSR) REGISTER

```
LOOP   BTFSS   SSPSTAT, BF      ;Has data been received (transmit complete)?
        BRA    LOOP            ;No
        MOVF   SSPBUF, W       ;WREG reg = contents of SSPBUF
        MOVWF  RXDATA          ;Save in user RAM, if data is meaningful
        MOVF   TXDATA, W       ;W reg = contents of TXDATA
        MOVWF  SSPBUF          ;New data to xmit
```

## REGISTER 19-2: RCSTA: RECEIVE STATUS AND CONTROL REGISTER

R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R-0	R-0	R-x
SPEN	RX9	SREN	CREN	ADDEN	FERR	OERR	RX9D
bit 7						bit 0	

- bit 7 **SPEN:** Serial Port Enable bit  
 1 = Serial port enabled (configures RX/DT and TX/CK pins as serial port pins)  
 0 = Serial port disabled (held in Reset)
- bit 6 **RX9:** 9-bit Receive Enable bit  
 1 = Selects 9-bit reception  
 0 = Selects 8-bit reception
- bit 5 **SREN:** Single Receive Enable bit  
Asynchronous mode:  
 Don't care.  
Synchronous mode – Master:  
 1 = Enables single receive  
 0 = Disables single receive  
 This bit is cleared after reception is complete.  
Synchronous mode – Slave:  
 Don't care.
- bit 4 **CREN:** Continuous Receive Enable bit  
Asynchronous mode:  
 1 = Enables receiver  
 0 = Disables receiver  
Synchronous mode:  
 1 = Enables continuous receive until enable bit CREN is cleared (CREN overrides SREN)  
 0 = Disables continuous receive
- bit 3 **ADDEN:** Address Detect Enable bit  
Asynchronous mode 9-bit (RX9 = 1):  
 1 = Enables address detection, enables interrupt and loads the receive buffer when RSR<8> is set  
 0 = Disables address detection, all bytes are received and ninth bit can be used as parity bit  
Asynchronous mode 9-bit (RX9 = 0):  
 Don't care.
- bit 2 **FERR:** Framing Error bit  
 1 = Framing error (can be updated by reading RCREG register and receiving next valid byte)  
 0 = No framing error
- bit 1 **OERR:** Overrun Error bit  
 1 = Overrun error (can be cleared by clearing bit CREN)  
 0 = No overrun error
- bit 0 **RX9D:** 9th bit of Received Data  
 This can be address/data bit or a parity bit and must be calculated by user firmware.

### Legend:

R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared    x = Bit is unknown

## 21.2 Comparator Operation

A single comparator is shown in Figure 21-2, along with the relationship between the analog input levels and the digital output. When the analog input at  $V_{IN+}$  is less than the analog input  $V_{IN-}$ , the output of the comparator is a digital low level. When the analog input at  $V_{IN+}$  is greater than the analog input  $V_{IN-}$ , the output of the comparator is a digital high level. The shaded areas of the output of the comparator in Figure 21-2 represent the uncertainty, due to input offsets and response time.

## 21.3 Comparator Reference

Depending on the comparator operating mode, either an external or internal voltage reference may be used. The analog signal present at  $V_{IN-}$  is compared to the signal at  $V_{IN+}$  and the digital output of the comparator is adjusted accordingly (Figure 21-2).

**FIGURE 21-2: SINGLE COMPARATOR**

### 21.3.1 EXTERNAL REFERENCE SIGNAL

When external voltage references are used, the comparator module can be configured to have the comparators operate from the same or different reference sources. However, threshold detector applications may require the same reference. The reference signal must be between  $V_{SS}$  and  $V_{DD}$  and can be applied to either pin of the comparator(s).

### 21.3.2 INTERNAL REFERENCE SIGNAL

The comparator module also allows the selection of an internally generated voltage reference from the comparator voltage reference module. This module is described in more detail in **Section 22.0 “Comparator Voltage Reference Module”**.

The internal reference is only available in the mode where four inputs are multiplexed to two comparators ( $CM\langle 2:0 \rangle = 110$ ). In this mode, the internal voltage reference is applied to the  $V_{IN+}$  pin of both comparators.

## 21.4 Comparator Response Time

Response time is the minimum time, after selecting a new reference voltage or input source, before the comparator output has a valid level. If the internal reference is changed, the maximum delay of the internal voltage reference must be considered when using the comparator outputs. Otherwise, the maximum delay of the comparators should be used (see **Section 27.0 “Electrical Characteristics”**).

## 21.5 Comparator Outputs

The comparator outputs are read through the CMCON register. These bits are read-only. The comparator outputs may also be directly output to the RA4 and RA5 I/O pins. When enabled, multiplexors in the output path of the RA4 and RA5 pins will switch and the output of each pin will be the unsynchronized output of the comparator. The uncertainty of each of the comparators is related to the input offset voltage and the response time given in the specifications. Figure 21-3 shows the comparator output block diagram.

The TRISA bits will still function as an output enable/disable for the RA4 and RA5 pins while in this mode.

The polarity of the comparator outputs can be changed using the C2INV and C1INV bits ( $CMCON\langle 5:4 \rangle$ ).

- Note 1:** When reading the Port register, all pins configured as analog inputs will read as a ‘0’. Pins configured as digital inputs will convert an analog input according to the Schmitt Trigger input specification.
- 2:** Analog levels on any pin defined as a digital input may cause the input buffer to consume more current than is specified.

# PIC18F2221/2321/4221/4321 FAMILY

---

NOTES:

# PIC18F2221/2321/4221/4321 FAMILY

## 23.1 Operation

When the HLVD module is enabled, a comparator uses an internally generated reference voltage as the set point. The set point is compared with the trip point, where each node in the resistor divider represents a trip point voltage. The “trip point” voltage is the voltage level at which the device detects a high or low-voltage event, depending on the configuration of the module. When the supply voltage is equal to the trip point, the voltage tapped off of the resistor array is equal to the internal reference voltage generated by the voltage reference module. The comparator then generates an interrupt signal by setting the HLVDIF bit.

The trip point voltage is software programmable to any one of 16 values. The trip point is selected by programming the HLVDL<3:0> bits (HLVDCON<3:0>).

The HLVD module has an additional feature that allows the user to supply the trip voltage to the module from an external source. This mode is enabled when bits HLVDL<3:0> are set to ‘1111’. In this state, the comparator input is multiplexed from the external input pin, HLVDIN. This gives users flexibility because it allows them to configure the High/Low-Voltage Detect interrupt to occur at any voltage in the valid operating range.

**FIGURE 23-1: HLVD MODULE BLOCK DIAGRAM (WITH EXTERNAL INPUT)**

# PIC18F2221/2321/4221/4321 FAMILY

## 23.2 HLVD Setup

The following steps are needed to set up the HLVD module:

1. Disable the module by clearing the HLVDEN bit (HLVDCON<4>).
2. Write the value to the HLVDL<3:0> bits that selects the desired HLVD trip point.
3. Set the VDIRMAG bit to detect high voltage (VDIRMAG = 1) or low voltage (VDIRMAG = 0).
4. Enable the HLVD module by setting the HLVDEN bit.
5. Clear the HLVD interrupt flag (PIR2<2>), which may have been set from a previous interrupt.
6. Enable the HLVD interrupt if interrupts are desired by setting the HLVDIE and GIE bits (PIE<2> and INTCON<7>). An interrupt will not be generated until the IRVST bit is set.

## 23.3 Current Consumption

When the module is enabled, the HLVD comparator and voltage divider are enabled and will consume static current. The total current consumption, when enabled, is specified in electrical specification parameter D022B.

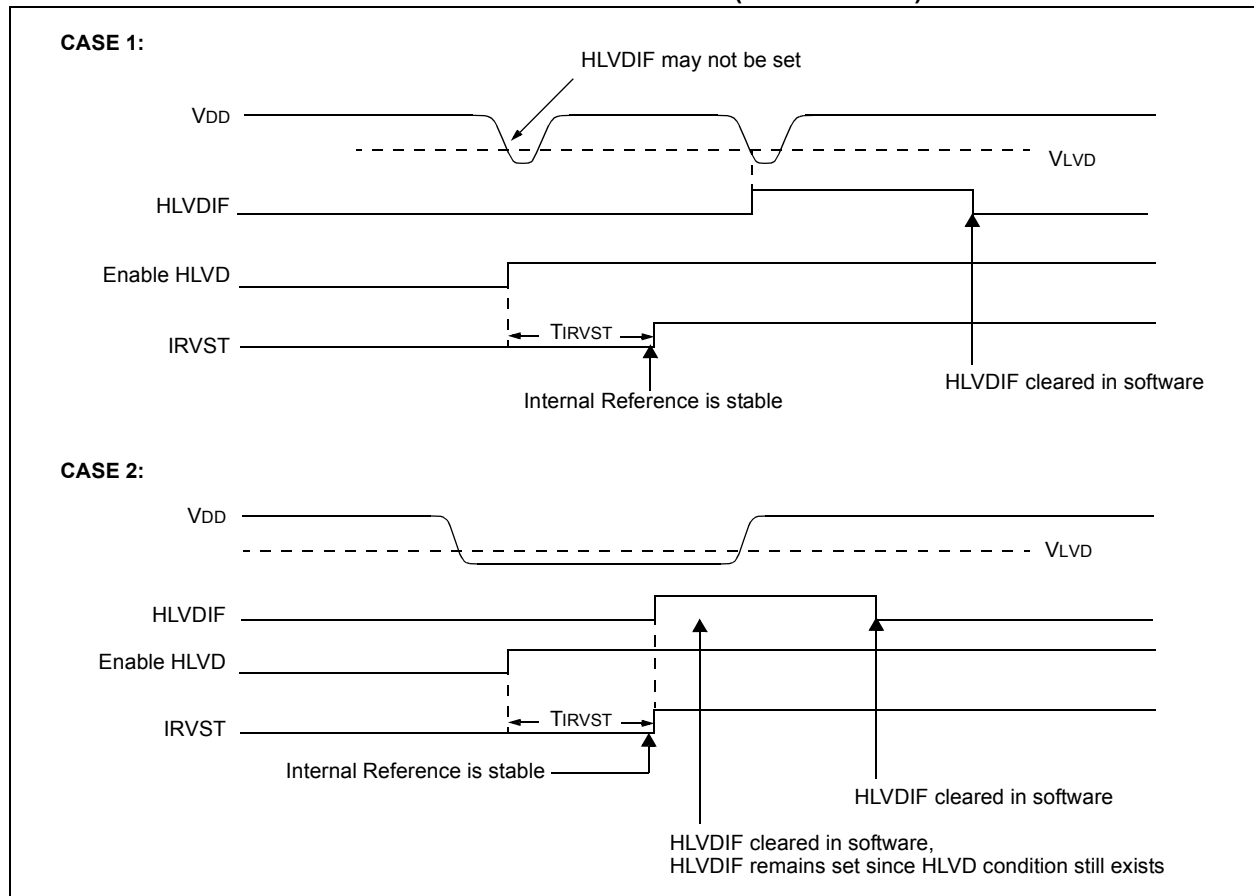

Depending on the application, the HLVD module does not need to be operating constantly. To decrease the current requirements, the HLVD circuitry may only need to be enabled for short periods where the voltage is checked. After doing the check, the HLVD module may be disabled.

## 23.4 HLVD Start-up Time

The internal reference voltage of the HLVD module, specified in electrical specification parameter D420, may be used by other internal circuitry, such as the Programmable Brown-out Reset. If the HLVD or other circuits using the voltage reference are disabled to lower the device's current consumption, the reference voltage circuit will require time to become stable before a low or high-voltage condition can be reliably detected. This start-up time, T<sub>IRVST</sub>, is an interval that is independent of device clock speed. It is specified in electrical specification parameter 36.

The HLVD interrupt flag is not enabled until T<sub>IRVST</sub> has expired and a stable reference voltage is reached. For this reason, brief excursions beyond the set point may not be detected during this interval. Refer to Figure 23-2 or Figure 23-3.

**FIGURE 23-2: LOW-VOLTAGE DETECT OPERATION (VDIRMAG = 0)**

# PIC18F2221/2321/4221/4321 FAMILY

## ADDWFC      ADD W and Carry bit to f

**Syntax:**            ADDWFC    f {,d {,a}}

**Operands:**         $0 \leq f \leq 255$   
 $d \in [0, 1]$   
 $a \in [0, 1]$

**Operation:**        (W) + (f) + (C) → dest

**Status Affected:**    N,OV, C, DC, Z

**Encoding:**

0010	00da	ffff	ffff
------	------	------	------

**Description:**     Add W, the Carry flag and data memory location 'f'. If 'd' is '0', the result is placed in W. If 'd' is '1', the result is placed in data memory location 'f'. If 'a' is '0', the Access Bank is selected. If 'a' is '1', the BSR is used to select the GPR bank (default). If 'a' is '0' and the extended instruction set is enabled, this instruction operates in Indexed Literal Offset Addressing mode whenever  $f \leq 95$  (5Fh). See **Section 25.2.3 "Byte-Oriented and Bit-Oriented Instructions in Indexed Literal Offset Mode"** for details.

**Words:**            1

**Cycles:**            1

Q Cycle Activity:

Q1	Q2	Q3	Q4
Decode	Read register 'f'	Process Data	Write to destination

**Example:**            ADDWFC    REG, 0, 1

Before Instruction  
 Carry bit = 1  
 REG = 02h  
 W = 4Dh

After Instruction  
 Carry bit = 0  
 REG = 02h  
 W = 50h

## ANDLW      AND Literal with W

**Syntax:**            ANDLW    k

**Operands:**         $0 \leq k \leq 255$

**Operation:**        (W) .AND. k → W

**Status Affected:**    N, Z

**Encoding:**

0000	1011	kkkk	kkkk
------	------	------	------

**Description:**     The contents of W are ANDed with the 8-bit literal 'k'. The result is placed in W.

**Words:**            1

**Cycles:**            1

Q Cycle Activity:

Q1	Q2	Q3	Q4
Decode	Read literal 'k'	Process Data	Write to W

**Example:**            ANDLW    05Fh

Before Instruction  
 W = A3h

After Instruction  
 W = 03h

# PIC18F2221/2321/4221/4321 FAMILY

**BRA**                      **Unconditional Branch**

---

Syntax:                    BRA n

Operands:                 $-1024 \leq n \leq 1023$

Operation:                 $(PC) + 2 + 2n \rightarrow PC$

Status Affected:        None

Encoding:                

1101	0nnn	nnnn	nnnn
------	------	------	------

Description:             Add the 2's complement number '2n' to the PC. Since the PC will have incremented to fetch the next instruction, the new address will be  $PC + 2 + 2n$ . This instruction is a two-cycle instruction.

Words:                    1

Cycles:                    2

Q Cycle Activity:

Q1	Q2	Q3	Q4
Decode	Read literal 'n'	Process Data	Write to PC
No operation	No operation	No operation	No operation

Example:                                       HERE                    BRA                    Jump

Before Instruction

PC                            =                    address (HERE)

After Instruction

PC                            =                    address (Jump)

**BSF**                        **Bit Set f**

---

Syntax:                    BSF f, b {,a}

Operands:                 $0 \leq f \leq 255$   
 $0 \leq b \leq 7$   
 $a \in [0, 1]$

Operation:                 $1 \rightarrow f < b >$

Status Affected:        None

Encoding:                

1000	bbba	ffff	ffff
------	------	------	------

Description:             Bit 'b' in register 'f' is set.  
 If 'a' is '0', the Access Bank is selected. If 'a' is '1', the BSR is used to select the GPR bank (default).  
 If 'a' is '0' and the extended instruction set is enabled, this instruction operates in Indexed Literal Offset Addressing mode whenever  $f \leq 95$  (5Fh). See **Section 25.2.3 "Byte-Oriented and Bit-Oriented Instructions in Indexed Literal Offset Mode"** for details.

Words:                    1

Cycles:                    1

Q Cycle Activity:

Q1	Q2	Q3	Q4
Decode	Read register 'f'	Process Data	Write register 'f'

Example:                                       BSF                    FLAG\_REG, 7, 1

Before Instruction

FLAG\_REG                    =                    0Ah

After Instruction

FLAG\_REG                    =                    8Ah

# PIC18F2221/2321/4221/4321 FAMILY

## LFSR Load FSR

Syntax: LFSR f, k

Operands:  $0 \leq f \leq 2$   
 $0 \leq k \leq 4095$

Operation:  $k \rightarrow \text{FSRf}$

Status Affected: None

Encoding:

1110	1110	00ff	$k_{11}kkk$
1111	0000	$k_7kkk$	$kkkk$

Description: The 12-bit literal 'k' is loaded into the File Select Register pointed to by 'f'.

Words: 2

Cycles: 2

Q Cycle Activity:

	Q1	Q2	Q3	Q4
	Decode	Read literal 'k' MSB	Process Data	Write literal 'k' MSB to FSRfH
	Decode	Read literal 'k' LSB	Process Data	Write literal 'k' to FSRfL

**Example:** LFSR 2, 3ABh

After Instruction

FSR2H	=	03h
FSR2L	=	ABh

## MOVF Move f

Syntax: MOVF f {,d {,a}}

Operands:  $0 \leq f \leq 255$   
 $d \in [0, 1]$   
 $a \in [0, 1]$

Operation:  $f \rightarrow \text{dest}$

Status Affected: N, Z

Encoding:

0101	00da	ffff	ffff
------	------	------	------

Description: The contents of register 'f' are moved to a destination dependent upon the status of 'd'. If 'd' is '0', the result is placed in W. If 'd' is '1', the result is placed back in register 'f' (default). Location 'f' can be anywhere in the 256-byte bank.

If 'a' is '0', the Access Bank is selected. If 'a' is '1', the BSR is used to select the GPR bank (default).

If 'a' is '0' and the extended instruction set is enabled, this instruction operates in Indexed Literal Offset Addressing mode whenever  $f \leq 95$  (5Fh). See **Section 25.2.3 "Byte-Oriented and Bit-Oriented Instructions in Indexed Literal Offset Mode"** for details.

Words: 1

Cycles: 1

Q Cycle Activity:

	Q1	Q2	Q3	Q4
	Decode	Read register 'f'	Process Data	Write W

**Example:** MOVF REG, 0, 0

Before Instruction

REG	=	22h
W	=	FFh

After Instruction

REG	=	22h
W	=	22h

# PIC18F2221/2321/4221/4321 FAMILY

## MULLW Multiply Literal with W

Syntax: MULLW k

Operands:  $0 \leq k \leq 255$

Operation:  $(W) \times k \rightarrow \text{PRODH:PRODL}$

Status Affected: None

Encoding: 

0000	1101	kkkk	kkkk
------	------	------	------

Description: An unsigned multiplication is carried out between the contents of W and the 8-bit literal 'k'. The 16-bit result is placed in the PRODH:PRODL register pair. PRODH contains the high byte. W is unchanged.  
None of the Status flags are affected. Note that neither Overflow nor Carry is possible in this operation. A Zero result is possible but not detected.

Words: 1

Cycles: 1

Q Cycle Activity:

Q1	Q2	Q3	Q4
Decode	Read literal 'k'	Process Data	Write registers PRODH:PRODL

Example: MULLW 0C4h

Before Instruction

W = E2h  
PRODH = ?  
PRODL = ?

After Instruction

W = E2h  
PRODH = ADh  
PRODL = 08h

## MULWF Multiply W with f

Syntax: MULWF f{,a}

Operands:  $0 \leq f \leq 255$   
 $a \in [0, 1]$

Operation:  $(W) \times (f) \rightarrow \text{PRODH:PRODL}$

Status Affected: None

Encoding: 

0000	001a	ffff	ffff
------	------	------	------

Description: An unsigned multiplication is carried out between the contents of W and the register file location 'f'. The 16-bit result is stored in the PRODH:PRODL register pair. PRODH contains the high byte. Both W and 'f' are unchanged.  
None of the Status flags are affected. Note that neither Overflow nor Carry is possible in this operation. A Zero result is possible but not detected. If 'a' is '0', the Access Bank is selected. If 'a' is '1', the BSR is used to select the GPR bank (default). If 'a' is '0' and the extended instruction set is enabled, this instruction operates in Indexed Literal Offset Addressing mode whenever  $f \leq 95$  (5Fh). See **Section 25.2.3 "Byte-Oriented and Bit-Oriented Instructions in Indexed Literal Offset Mode"** for details.

Words: 1

Cycles: 1

Q Cycle Activity:

Q1	Q2	Q3	Q4
Decode	Read register 'f'	Process Data	Write registers PRODH:PRODL

Example: MULWF REG, 1

Before Instruction

W = C4h  
REG = B5h  
PRODH = ?  
PRODL = ?

After Instruction

W = C4h  
REG = B5h  
PRODH = 8Ah  
PRODL = 94h

# PIC18F2221/2321/4221/4321 FAMILY

## SLEEP Enter Sleep mode

Syntax: SLEEP

Operands: None

Operation: 00h → WDT,  
0 → WDT postscaler,  
1 →  $\overline{TO}$ ,  
0 →  $\overline{PD}$

Status Affected:  $\overline{TO}$ ,  $\overline{PD}$

Encoding: 

0000	0000	0000	0011
------	------	------	------

Description: The Power-Down status bit ( $\overline{PD}$ ) is cleared. The Time-out status bit ( $\overline{TO}$ ) is set. Watchdog Timer and its postscaler are cleared. The processor is put into Sleep mode with the oscillator stopped.

Words: 1

Cycles: 1

Q Cycle Activity:

Q1	Q2	Q3	Q4
Decode	No operation	Process Data	Go to Sleep

**Example:** SLEEP

Before Instruction

$\overline{TO}$  = ?  
 $\overline{PD}$  = ?

After Instruction

$\overline{TO}$  = 1†  
 $\overline{PD}$  = 0

† If WDT causes wake-up, this bit is cleared.

## SUBFWB Subtract f from W with Borrow

Syntax: SUBFWB f {,d {,a}}

Operands:  $0 \leq f \leq 255$   
 $d \in [0, 1]$   
 $a \in [0, 1]$

Operation:  $(W) - (f) - (\overline{C}) \rightarrow \text{dest}$

Status Affected: N, OV, C, DC, Z

Encoding: 

0101	01da	ffff	ffff
------	------	------	------

Description: Subtract register 'f' and Carry flag (borrow) from W (2's complement method). If 'd' is '0', the result is stored in W. If 'd' is '1', the result is stored in register 'f' (default). If 'a' is '0', the Access Bank is selected. If 'a' is '1', the BSR is used to select the GPR bank (default). If 'a' is '0' and the extended instruction set is enabled, this instruction operates in Indexed Literal Offset Addressing mode whenever  $f \leq 95$  (5Fh). See **Section 25.2.3 "Byte-Oriented and Bit-Oriented Instructions in Indexed Literal Offset Mode"** for details.

Words: 1

Cycles: 1

Q Cycle Activity:

Q1	Q2	Q3	Q4
Decode	Read register 'f'	Process Data	Write to destination

**Example 1:** SUBFWB REG, 1, 0

Before Instruction

REG = 3  
W = 2  
C = 1

After Instruction

REG = FF  
W = 2  
C = 0  
Z = 0  
N = 1 ; result is negative

**Example 2:** SUBFWB REG, 0, 0

Before Instruction

REG = 2  
W = 5  
C = 1

After Instruction

REG = 2  
W = 3  
C = 1  
Z = 0  
N = 0 ; result is positive

**Example 3:** SUBFWB REG, 1, 0

Before Instruction

REG = 1  
W = 2  
C = 0

After Instruction

REG = 0  
W = 2  
C = 1  
Z = 1 ; result is zero  
N = 0

**Legend:** Shading of rows is to assist in readability of the table.

**Note 1:** The power-down current in Sleep mode does not depend on the oscillator type. Power-down current is measured with the part in Sleep mode, with all I/O pins in high-impedance state and tied to V<sub>DD</sub> or V<sub>SS</sub>, and all features that add delta current disabled (such as WDT, Timer1 Oscillator, BOR, etc.).

**2:** The supply current is mainly a function of operating voltage, frequency and mode. Other factors, such as I/O pin loading and switching rate, oscillator type and circuit, internal code execution pattern and temperature, also have an impact on the current consumption.

The test conditions for all IDD measurements in active operation mode are:

OSC1 = external square wave, from rail-to-rail; all I/O pins tri-stated, pulled to V<sub>DD</sub> or V<sub>SS</sub>;

MCLR = V<sub>DD</sub>; WDT enabled/disabled as specified.

**3:** Low-power, Timer1 oscillator is selected unless otherwise indicated, where LPT1OSC (CONFIG3H<2>) = 1.

**4:** BOR and HLVD enable internal band gap reference. With both modules enabled, current consumption will be less than the sum of both specifications.

**5:** When operation below  $-10^{\circ}\text{C}$  is expected, use T1OSC High-Power mode, where LPT1OSC (CONFIG3H<2>) = 0.

			—	±50	nA	V <sub>DD</sub> < 3V, V <sub>SS</sub> ≤ V <sub>PIN</sub> ≤ V <sub>DD</sub> , Pin at High-Impedance		
D061			$\overline{\text{MCLR}}$	—	±1	μA	V <sub>SS</sub> ≤ V <sub>PIN</sub> ≤ V <sub>DD</sub>	
D063	OSC1	—	±1	μA	V <sub>SS</sub> ≤ V <sub>PIN</sub> ≤ V <sub>DD</sub>			

**Note 1:** In RC oscillator configuration, the OSC1/CLKI pin is a Schmitt Trigger input. It is not recommended that the PIC® device be driven with an external clock while in RC mode.

**2:** The leakage current on the  $\overline{\text{MCLR}}$  pin is strongly dependent on the applied voltage level. The specified levels represent normal operating conditions. Higher leakage current may be measured at different input voltages.

**3:** Negative current is defined as current sourced by the pin.
