

Welcome to [E-XFL.COM](#)

### What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

### Applications of "[Embedded - Microcontrollers](#)"

#### Details

Product Status	Active
Core Processor	eZ8
Core Size	8-Bit
Speed	20MHz
Connectivity	I <sup>2</sup> C, IrDA, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, DMA, POR, PWM, WDT
Number of I/O	31
Program Memory Size	32KB (32K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	2K x 8
Voltage - Supply (Vcc/Vdd)	3V ~ 3.6V
Data Converters	A/D 8x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 105°C (TA)
Mounting Type	Surface Mount
Package / Case	44-LCC (J-Lead)
Supplier Device Package	-
Purchase URL	<a href="https://www.e-xfl.com/product-detail/zilog/z8f3221vn020eg">https://www.e-xfl.com/product-detail/zilog/z8f3221vn020eg</a>

0038-BFFF	Program Memory
<b>Z8F642x Products</b>	
0000-0001	Option Bits
0002-0003	Reset Vector
0004-0005	WDT Interrupt Vector
0006-0007	Illegal Instruction Trap
0008-0037	Interrupt Vectors*
0038-FFFF	Program Memory
Note: *See <a href="#">Table 23</a> on page 48 for a list of the interrupt vectors.	

## Data Memory

The Z8 Encore! XP F64xx Series does not use the eZ8 CPU's 64KB data memory address space.

## Information Area

Table 6 describes the Z8 Encore! XP F64xx Series' Information Area. This 512-byte Information Area is accessed by setting bit 7 of the Page Select Register to 1. When access is enabled, the Information Area is mapped into program memory and overlays the 512 bytes at addresses FE00H to FFFFH. When the Information Area access is enabled, execution of the LDC and LDCI instructions from these program memory addresses return the Information Area data rather than the program memory data. Reads of these addresses through the On-Chip Debugger also returns the Information Area data. Execution of code from these addresses continues to correctly use program memory. Access to the Information Area is read-only.

## Reset and Stop Mode Recovery

The Reset Controller within the Z8 Encore! XP F64xx Series controls Reset and Stop Mode Recovery operation. In typical operation, the following events cause a Reset to occur:

- Power-On Reset
- Voltage Brown-Out
- Watchdog Timer time-out (when configured via the WDT\_RES option bit to initiate a Reset)
- External  $\overline{\text{RESET}}$  pin assertion
- On-Chip Debugger initiated Reset (OCDCTL[0] set to 1)

When the Z8 Encore! XP F64xx Series devices are in STOP Mode, a Stop Mode Recovery is initiated by either of the following events:

- Watchdog Timer time-out
- GPIO port input pin transition on an enabled Stop Mode Recovery source
- DBG pin driven Low

### Reset Types

The Z8 Encore! XP F64xx Series provides two different types of reset operation (system reset and Stop Mode Recovery). The type of Reset is a function of both the current operating mode of the Z8 Encore! XP F64xx Series devices and the source of the Reset. Table 8 lists the types of Reset and their operating characteristics.

**Table 8. Reset and Stop Mode Recovery Characteristics and Latency**

Reset Type	Reset Characteristics and Latency		
	Control Registers	eZ8 CPU	Reset Latency (Delay)
System reset	Reset (as applicable)	Reset	66 WDT Oscillator cycles + 16 System Clock cycles
Stop Mode Recovery	Unaffected, except WDT_CTL Register	Reset	66 WDT Oscillator cycles + 16 System Clock cycles

- Writing a 1 to the IRQE bit in the Interrupt Control Register

Interrupts are globally disabled by any of the following operations:

- Execution of a Disable Interrupt (DI) instruction
- eZ8 CPU acknowledgement of an interrupt service request from the interrupt controller
- Writing a 0 to the IRQE bit in the Interrupt Control Register
- Reset
- Executing a trap instruction
- Illegal instruction trap

## Interrupt Vectors and Priority

The interrupt controller supports three levels of interrupt priority. Level 3 is the highest priority, Level 2 is the second highest priority, and Level 1 is the lowest priority. If all of the interrupts were enabled with identical interrupt priority (all as Level 2 interrupts, for example), then the interrupt priority would be assigned from highest to lowest, as specified in Table 23. Level 3 interrupts always have higher priority than Level 2 interrupts which, in turn, always have higher priority than Level 1 interrupts. Within each interrupt priority level (Level 1, Level 2, or Level 3), priority is assigned as specified in Table 23. Resets, Watchdog Timer interrupts (if enabled), and illegal instruction traps always have highest priority.

## Interrupt Assertion

Interrupt sources assert their interrupt requests for only a single system clock period (single pulse). When the interrupt request is acknowledged by the eZ8 CPU, the corresponding bit in the Interrupt Request Register is cleared until the next interrupt occurs. Writing a 0 to the corresponding bit in the Interrupt Request Register likewise clears the interrupt request.

---

**! Caution:** Zilog recommends not using a coding style that clears bits in the Interrupt Request registers. All incoming interrupts received between execution of the first LDX command and the final LDX command are lost. See Example 1, which follows.

---

**Example 1.** A poor coding style that can result in lost interrupt requests:

```
LDX r0, IRQ0
AND r0, MASK
LDX IRQ0, r0
```

**Table 39. Timer 0–3 High Byte Register (TxH)**

Bit	7	6	5	4	3	2	1	0
Field	TH							
RESET	0							
R/W	R/W							
Address	F00H, F08H, F10H, F18H							

**Table 40. Timer 0–3 Low Byte Register (TxL)**

Bit	7	6	5	4	3	2	1	0
Field	TL							
RESET	0							1
R/W	R/W							
Address	F01H, F09H, F11H, F19H							

Bit	Description
[7:0]	<b>Timer High and Low Bytes</b>
TH, TL	These 2 bytes, {TMRH[7:0], TMRL[7:0]}, contain the current 16-bit timer count value.

Bit	Description
[7] TEN	<p><b>Timer Enable</b> 0 = Timer is disabled. 1 = Timer enabled to count.</p>
[6] TPOL	<p><b>Timer Input/Output Polarity</b> Operation of this bit is a function of the current operating mode of the timer.</p> <p><b>ONE-SHOT Mode</b> When the timer is disabled, the timer output signal is set to the value of this bit. When the timer is enabled, the timer output signal is complemented upon timer reload.</p> <p><b>CONTINUOUS Mode</b> When the timer is disabled, the timer output signal is set to the value of this bit. When the timer is enabled, the timer output signal is complemented upon timer reload.</p> <p><b>COUNTER Mode</b> When the timer is disabled, the timer output signal is set to the value of this bit. When the timer is enabled, the timer output signal is complemented upon timer reload. 0 = Count occurs on the rising edge of the timer input signal. 1 = Count occurs on the falling edge of the timer input signal.</p> <p><b>PWM Mode</b> 0 = timer output is forced Low (0) when the timer is disabled. When enabled, the timer output is forced High (1) upon PWM count match and forced Low (0) upon reload. 1 = timer output is forced High (1) when the timer is disabled. When enabled, the timer output is forced Low (0) upon PWM count match and forced High (1) upon reload.</p> <p><b>CAPTURE Mode</b> 0 = Count is captured on the rising edge of the timer input signal. 1 = Count is captured on the falling edge of the timer input signal.</p> <p><b>COMPARE Mode</b> When the timer is disabled, the timer output signal is set to the value of this bit. When the timer is enabled, the timer output signal is complemented upon timer reload.</p> <p><b>GATED Mode</b> 0 = Timer counts when the timer input signal is High (1) and interrupts are generated on the falling edge of the timer input. 1 = Timer counts when the timer input signal is Low (0) and interrupts are generated on the rising edge of the timer input.</p> <p><b>CAPTURE/COMPARE Mode</b> 0 = Counting is started on the first rising edge of the timer input signal. The current count is captured on subsequent rising edges of the timer input signal. 1 = Counting is started on the first falling edge of the timer input signal. The current count is captured on subsequent falling edges of the timer input signal.</p> <p><b>Caution:</b> When the timer output alternate function TxOUT on a GPIO port pin is enabled, TxOUT will change to whatever state the TPOL bit is in. The timer does not need to be enabled for that to happen. Also, the Port Data Direction Subregister is not needed to be set to output on TxOUT. Changing the TPOL bit with the timer enabled and running does not immediately change the TxOUT.</p>

5. After the first bit has been shifted out, a transmit interrupt is asserted.
6. Software responds by writing the lower eight bits of address to the I<sup>2</sup>C Data Register.
7. The I<sup>2</sup>C Controller completes shifting of the two address bits and a 0 (write).
8. If the I<sup>2</sup>C slave acknowledges the first address byte by pulling the SDA signal Low during the next High period of SCL, the I<sup>2</sup>C Controller sets the ACK bit in the I<sup>2</sup>C Status Register. Continue with Step 9.

If the slave does not acknowledge the first address byte, the I<sup>2</sup>C Controller sets the NCKI bit and clears the ACK bit in the I<sup>2</sup>C Status Register. Software responds to the Not Acknowledge interrupt by setting the stop and flush bits and clearing the TXI bit. The I<sup>2</sup>C Controller sends the stop condition on the bus and clears the stop and NCKI bits. The transaction is complete (ignore following steps).

9. The I<sup>2</sup>C Controller loads the I<sup>2</sup>C Shift Register with the contents of the I<sup>2</sup>C Data Register (second address byte).
10. The I<sup>2</sup>C Controller shifts out the second address byte. After the first bit is shifted, the I<sup>2</sup>C Controller generates a transmit interrupt.
11. Software responds by setting the start bit of the I<sup>2</sup>C Control Register to generate a repeated start by clearing the TXI bit.
12. Software responds by writing 11110B followed by the 2-bit slave address and a 1 (read) to the I<sup>2</sup>C Data Register.
13. If only one byte is to be read, software sets the NAK bit of the I<sup>2</sup>C Control Register.
14. After the I<sup>2</sup>C Controller shifts out the 2nd address byte, the I<sup>2</sup>C slave sends an acknowledge by pulling the SDA signal Low during the next High period of SCL, the I<sup>2</sup>C Controller sets the ACK bit in the I<sup>2</sup>C Status Register. Continue with Step 15.

If the slave does not acknowledge the second address byte, the I<sup>2</sup>C Controller sets the NCKI bit and clears the ACK bit in the I<sup>2</sup>C Status Register. Software responds to the Not Acknowledge interrupt by setting the stop and flush bits and clearing the TXI bit. The I<sup>2</sup>C Controller sends the stop condition on the bus and clears the stop and NCKI bits. The transaction is complete (ignore the following steps).

15. The I<sup>2</sup>C Controller sends the repeated start condition.
16. The I<sup>2</sup>C Controller loads the I<sup>2</sup>C Shift Register with the contents of the I<sup>2</sup>C Data Register (third address transfer).
17. The I<sup>2</sup>C Controller sends 11110B followed by the two most significant bits of the slave read address and a 1 (read).
18. The I<sup>2</sup>C slave sends an acknowledge by pulling the SDA signal Low during the next High period of SCL.

Bit	Description (Continued)
[3] WSEL	<b>Word Select</b> 0 = DMAx transfers a single byte per request. 1 = DMAx transfers a two-byte word per request. The address for the on-chip peripheral control register must be an even address.
[2:0] RSS	<b>Request Trigger Source Select</b> The Request Trigger Source Select field determines the peripheral that can initiate a DMA transfer. The corresponding interrupts do not need to be enabled within the Interrupt Controller to initiate a DMA transfer. However, if the Request Trigger Source can enable or disable the interrupt request sent to the Interrupt Controller, the interrupt request must be enabled within the Request Trigger Source block. 000 = Timer 0. 001 = Timer 1. 010 = Timer 2. 011 = Timer 3. 100 = DMA0 Control Register: UART0 Received Data Register contains valid data. DMA1 Control Register: UART0 Transmit Data Register empty. 101 = DMA0 Control Register: UART1 Received Data Register contains valid data. DMA1 Control Register: UART1 Transmit Data Register empty. 110 = DMA0 Control Register: I <sup>2</sup> C Receiver Interrupt. DMA1 Control Register: I <sup>2</sup> C Transmitter Interrupt Register empty. 111 = Reserved.

## DMAx I/O Address Register

The DMAx I/O Address Register, shown in Table 79, contains the low byte of the on-chip peripheral address for data transfer. The full 12-bit Register File address is provided by {FH, DMAx\_IO[7:0]}. When the DMA is configured for two-byte word transfers, the DMAx I/O Address Register must contain an even-numbered address.

**Table 79. DMAx I/O Address Register (DMAxIO)**

Bit	7	6	5	4	3	2	1	0
Field	DMA_IO							
RESET	X							
R/W	R/W							
Address	FB1H, FB9H							

Bit	Description
[7:0] DMA_IO	<b>DMA On-Chip Peripheral Control Register Address</b> This byte sets the low byte of the on-chip peripheral control register address on Register File Page FH (addresses F00H to FFFH).

Table 84. DMA\_ADC Address Register (DMAA\_ADDR)

Bit	7	6	5	4	3	2	1	0
Field	DMAA_ADDR							Reserved
RESET	X							
R/W	R/W							
Address	FBDH							

Bit	Description
[7:1] DMAA_ADDR	<b>DMA_ADC Address</b> These bits specify the seven most significant bits of the 12-bit Register File addresses used for storing the ADC output data. The ADC analog input Number defines the five least significant bits of the Register File address. Full 12-bit address is {DMAA_ADDR[7:1], 4-bit ADC analog input Number, 0}.
0	<b>Reserved</b> This bit is reserved and must be programmed to 0.

## DMA\_ADC Control Register

The DMA\_ADC Control Register, shown in Table 85, enables and sets options (DMA enable and interrupt enable) for ADC operation.

Table 85. DMA\_ADC Control Register (DMAACTL)

Bit	7	6	5	4	3	2	1	0
Field	DAEN	IRQEN	Reserved		ADC_IN			
RESET	0							
R/W	R/W							
Address	FBEH							

Bit	Description
[7] DAEN	<b>DMA_ADC Enable</b> 0 = DMA_ADC is disabled and the ADC analog input Number (ADC_IN) is reset to 0. 1 = DMA_ADC is enabled.
[6] IRQEN	<b>Interrupt Enable</b> 0 = DMA_ADC does not generate any interrupts. 1 = DMA_ADC generates an interrupt after transferring data from the last ADC analog input specified by the ADC_IN field.

## Flash Memory Address 0000H

Table 99. Flash Option Bits At Flash Memory Address 0000H

Bit	7	6	5	4	3	2	1	0
Field	WDT_RES	WDT_AO	OSC_SEL[1:0]		VBO_AO	RP	Reserved	FWP
RESET	U							
R/W	R/W							
Address	Program Memory 0000H							
Note: U = Unchanged by Reset; R/W = Read/Write.								

Bit	Description
[7] WDT_RES	<b>Watchdog Timer Reset</b> 0 = Watchdog Timer time-out generates an interrupt request. Interrupts must be globally enabled for the eZ8 CPU to acknowledge the interrupt request. 1 = Watchdog Timer time-out causes a Short Reset. This setting is the default for unprogrammed (erased) Flash.
[6] WDT_AO	<b>Watchdog Timer Always On</b> 0 = Watchdog Timer is automatically enabled upon application of system power. Watchdog Timer can not be disabled except during STOP Mode (if configured to power down during STOP Mode). 1 = Watchdog Timer is enabled upon execution of the WDT instruction. Once enabled, the Watchdog Timer can only be disabled by a Reset or Stop Mode Recovery. This setting is the default for unprogrammed (erased) Flash.
[5:4] OSC_SEL[1:0]	<b>Oscillator Mode Selection</b> 00 = On-chip oscillator configured for use with external RC networks (<4MHz). 01 = Minimum power for use with very low frequency crystals (32kHz to 1.0MHz). 10 = Medium power for use with medium frequency crystals or ceramic resonators (0.5MHz to 10.0MHz). 11 = Maximum power for use with high frequency crystals (8.0MHz to 20.0MHz). This setting is the default for unprogrammed (erased) Flash.
[3] VBO_AO	<b>Voltage Brown-Out Protection Always On</b> 0 = Voltage Brown-Out Protection is disabled in STOP Mode to reduce total power consumption. 1 = Voltage Brown-Out Protection is always enabled including during STOP Mode. This setting is the default for unprogrammed (erased) Flash.
[2] RP	<b>Read Protect</b> 0 = User program code is inaccessible. Limited control features are available through the On-Chip Debugger. 1 = User program code is accessible. All On-Chip Debugger commands are enabled. This setting is the default for unprogrammed (erased) Flash.

Bit	Description (Continued)
[1]	<b>Reserved</b> This bit is reserved and must be programmed to 0.
[0] FWP	<b>Flash Write Protect (Flash version only)</b> 0 = Programming, Page Erase, and Mass Erase through User Code is disabled. Mass Erase is available through the On-Chip Debugger. 1 = Programming, and Page Erase are enabled for all of Flash program memory.

## Flash Memory Address 0001H

Table 100. Options Bits at Flash Memory Address 0001H

Bit	7	6	5	4	3	2	1	0
Field	Reserved							
RESET	U							
R/W	R/W							
Address	Program Memory 0001H							
Note: U = Unchanged by Reset. R/W = Read/Write.								

Bit	Description
[7:0]	<b>Reserved</b> These option bits are reserved for future use and must always be 1. This setting is the default for unprogrammed (erased) Flash.

## Operation

The following section describes the operation of the OCD.

### OCD Interface

The On-Chip Debugger uses the DBG pin for communication with an external host. This one-pin interface is a bidirectional open-drain interface that transmits and receives data. Data transmission is half-duplex, meaning that transmit and receive operations cannot occur simultaneously. The serial data on the DBG pin is sent using the standard asynchronous data format defined in RS-232. This pin can interface the Z8 Encore! XP F64xx Series products to the serial port of a host PC using minimal external hardware. Two different methods for connecting the DBG pin to an RS-232 interface are depicted in Figures 37 and 38.

---

**! Caution:** For proper operation of the On-Chip Debugger, all power pins ( $V_{DD}$  and  $AV_{DD}$ ) must be supplied with power, and all ground pins ( $V_{SS}$  and  $AV_{SS}$ ) must be properly grounded. The DBG pin is open-drain and must always be connected to  $V_{DD}$  through an external pull-up resistor to ensure proper operation.

---

## Serial Peripheral Interface

For more information about these SPI Control registers, see the [SPI Control Register Definitions](#) section on page 121.

**Hex Address: F60****Table 195. SPI Data Register (SPIDATA)**

Bit	7	6	5	4	3	2	1	0
Field	DATA							
RESET	X							
R/W	R/W							
Address	F60H							

**Table 268. Flash Sector Protect Register (FPROT)**

Bit	7	6	5	4	3	2	1	0
Field	SECT7	SECT6	SECT5	SECT4	SECT3	SECT2	SECT1	SECT0
RESET	0							
R/W	R/W*							
Address	FF9H							

Note: \*R/W = This register is accessible for read operations; it can be written to 1 only via user code.

**Hex Address: FFA**

**Table 269. Flash Frequency High Byte Register (FFREQH)**

Bit	7	6	5	4	3	2	1	0
Field	FFREQH							
RESET	0							
R/W	R/W							
Address	FFAH							

**Hex Address: FFB**

**Table 270. Flash Frequency Low Byte Register (FFREQL)**

Bit	7	6	5	4	3	2	1	0
Field	FFREQL							
RESET	0							
R/W	R/W							
Address	FFBH							

**Hex Addresses: FFC–FFF**

Refer to the [eZ8 CPU Core User Manual \(UM0128\)](#)

SPIBRL register 128, 266  
 SPICTL register 123, 265  
 SPIDATA register 123, 264  
 SPIMODE register 126, 265  
 SPISTAT register 124, 265  
 SRA 235  
 src 229  
 SRL 235  
 SRP 233  
 stack pointer 229  
 status register, I2C 143  
 STOP 233  
 STOP mode 35, 233  
 Stop Mode Recovery  
     sources 33  
     using a GPIO port pin transition 34  
     using watchdog timer time-out 34  
 SUB 232  
 subtract 232  
 subtract - extended addressing 232  
 subtract with carry 232  
 subtract with carry - extended addressing 232  
 SUBX 232  
 SWAP 235  
 swap nibbles 235  
 symbols, additional 229  
 system and core resets 30

## **T**

TCM 232  
 TCMX 232  
 test complement under mask 232  
 test complement under mask - extended addressing 232  
 test under mask 232  
 test under mask - extended addressing 232  
 timer signals 16  
 timers 6, 63  
     architecture 63  
     block diagram 64  
     capture mode 69, 79  
     capture/compare mode 71, 79  
     compare mode 70, 79

continuous mode 65, 79  
 counter mode 66  
 counter modes 79  
 gated mode 71, 79  
 one-shot mode 64, 79  
 operating mode 64  
 PWM mode 67, 79  
 reading the timer count values 72  
 reload high and low byte registers 75  
 timer control register definitions 73  
 timer output signal operation 73  
 timers 0-3  
     control 0 registers 77  
     control 1 registers 78  
     high and low byte registers 73, 76  
 TM 232  
 TMX 232  
 transmit  
     IrDA data 111  
 transmit interrupt 131  
 transmitting UART data-interrupt-driven method 91  
 transmitting UART data-polled method 90  
 TRAP 234

## **U**

UART 5, 88  
     architecture 88  
     asynchronous data format without/with parity 90  
     baud rate generator 99  
     baud rates table 108  
     control register definitions 99  
     controller signals 16  
     interrupts 97  
     multiprocessor mode 94  
     receiving data using interrupt-driven method 93  
     receiving data using the polled method 92  
     transmitting data using the interrupt-driven method 91  
     transmitting data using the polled method 90  
     x baud rate high and low registers 106  
     x control 0 and control 1 registers 103
