Understanding [Embedded - CPLDs \(Complex Programmable Logic Devices\)](#)

Embedded - CPLDs, or Complex Programmable Logic Devices, are highly versatile digital logic devices used in electronic systems. These programmable components are designed to perform complex logical operations and can be customized for specific applications. Unlike fixed-function ICs, CPLDs offer the flexibility to reprogram their configuration, making them an ideal choice for various embedded systems. They consist of a set of logic gates and programmable interconnects, allowing designers to implement complex logic circuits without needing custom hardware.

Description

The CoolRunner-II 64-macrocell device is designed for both high performance and low power applications. This lends power savings to high-end communication equipment and high speed to battery operated devices. Due to the low power stand-by and dynamic operation, overall system reliability is improved.

This device consists of four Function Blocks inter-connected by a low power Advanced Interconnect Matrix (AIM). The AIM feeds 40 true and complement inputs to each Function Block. The Function Blocks consist of a 40 by 56 P-term PLA and 16 macrocells which contain numerous configuration bits that allow for combinational or registered modes of operation.

Additionally, these registers can be globally reset or preset and configured as a D or T flip-flop or as a D latch. There are also multiple clock signals, both global and local product term types, configured on a per macrocell basis. Output pin configurations include slew rate limit, bus hold, pull-up, open drain, and programmable grounds. A Schmitt trigger input is available on a per input pin basis. In addition to storing macrocell output states, the macrocell registers can be configured as "direct input" registers to store signals directly from input pins.

Clocking is available on a global or Function Block basis. Three global clocks are available for all Function Blocks as a synchronous clock source. Macrocell registers can be individually configured to power up to the zero or one state. A global set/reset control line is also available to asynchronously set or reset selected registers during operation. Additional local clock, synchronous clock-enable, asynchronous set/reset, and output enable signals can be formed using product terms on a per-macrocell or per-Function Block basis.

A DualEDGE flip-flop feature is also available on a per macrocell basis. This feature allows high performance synchronous operation based on lower frequency clocking to help reduce the total power consumption of the device.

The CoolRunner-II 64-macrocell CPLD is I/O compatible with standard LVTTTL and LVC MOS18, LVC MOS25, and LVC MOS33 (see [Table 1](#)). This device is also 1.5V I/O compatible with the use of Schmitt-trigger inputs.

Another feature that eases voltage translation is I/O banking. Two I/O banks are available on the CoolRunner-II 64A macrocell device that permit easy interfacing to 3.3V, 2.5V, 1.8V, and 1.5V devices.

RealDigital Design Technology

Xilinx® CoolRunner-II CPLDs are fabricated on a 0.18 micron process technology which is derived from leading edge FPGA product development. CoolRunner-II CPLDs employ RealDigital, a design technique that makes use of CMOS technology in both the fabrication and design methodology. RealDigital design technology employs a cascade of CMOS gates to implement sum of products instead of traditional sense amplifier methodology. Due to this technology, Xilinx CoolRunner-II CPLDs achieve both high performance and low power operation.

Supported I/O Standards

The CoolRunner-II 64 macrocell features both LVC MOS and LVTTTL I/O implementations. See [Table 1](#) for I/O standard voltages. The LVTTTL I/O standard is a general purpose EIA/JEDEC standard for 3.3V applications that use an

LVTTTL input buffer and Push-Pull output buffer. The LVC MOS standard is used in 3.3V, 2.5V, and 1.8V applications. CoolRunner-II CPLDs are also 1.5V I/O compatible with the use of Schmitt-trigger inputs.

Note: Due to the small size of chip scale and quad flat no lead packages, the complete ordering part number cannot be included on the package marking. Part marking on chip scale and quad flat no lead packages by line are:

1. X (Xilinx logo) then truncated part number
2. Not related to device part number
3. Not related to device part number
4. Device code, speed, operating temperature, three digits not related to device part number. Device codes: C3 = CP56, C4 = CPG56, Q2 = QFG48.
