
Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	PIC
Core Size	16-Bit
Speed	32MHz
Connectivity	I²C, IrDA, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, LVD, POR, PWM, WDT
Number of I/O	35
Program Memory Size	32KB (11K x 24)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	8K x 8
Voltage - Supply (Vcc/Vdd)	2V ~ 3.6V
Data Converters	A/D 13x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	44-TQFP
Supplier Device Package	44-TQFP (10x10)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic24fj32ga104t-i-pt

Table of Contents

4.2.2 DATA MEMORY ORGANIZATION AND ALIGNMENT

To maintain backward compatibility with PIC® devices and improve data space memory usage efficiency, the PIC24F instruction set supports both word and byte operations. As a consequence of byte accessibility, all Effective Address calculations are internally scaled to step through word-aligned memory. For example, the core recognizes that Post-Modified Register Indirect Addressing mode [Ws++] will result in a value of Ws + 1 for byte operations and Ws + 2 for word operations.

Data byte reads will read the complete word which contains the byte using the LSb of any EA to determine which byte to select. The selected byte is placed onto the LSB of the data path. That is, data memory and registers are organized as two parallel, byte-wide entities with shared (word) address decode, but separate write lines. Data byte writes only write to the corresponding side of the array or register which matches the byte address.

All word accesses must be aligned to an even address. Misaligned word data fetches are not supported, so care must be taken when mixing byte and word operations or translating from 8-bit MCU code. If a misaligned read or write is attempted, an address error trap will be generated. If the error occurred on a read, the instruction underway is completed; if it occurred on a write, the instruction will be executed but the write will not occur. In either case, a trap is then executed, allowing the system and/or user to examine the machine state prior to execution of the address Fault.

All byte loads into any W register are loaded into the Least Significant Byte. The Most Significant Byte is not modified.

A Sign-Extend (SE) instruction is provided to allow users to translate 8-bit signed data to 16-bit signed values. Alternatively, for 16-bit unsigned data, users can clear the MSB of any W register by executing a Zero-Extend (ZE) instruction on the appropriate address.

Although most instructions are capable of operating on word or byte data sizes, it should be noted that some instructions operate only on words.

4.2.3 NEAR DATA SPACE

The 8-Kbyte area between 0000h and 1FFFh is referred to as the near data space. Locations in this space are directly addressable via a 13-bit absolute address field within all memory direct instructions. The remainder of the data space is indirectly addressable. Additionally, the whole data space is addressable using MOV instructions, which support Memory Direct Addressing with a 16-bit address field.

4.2.4 SFR SPACE

The first 2 Kbytes of the near data space, from 0000h to 07FFh, are primarily occupied with Special Function Registers (SFRs). These are used by the PIC24F core and peripheral modules for controlling the operation of the device.

SFRs are distributed among the modules that they control and are generally grouped together by module. Much of the SFR space contains unused addresses; these are read as '0'. A diagram of the SFR space, showing where SFRs are actually implemented, is shown in Table 4-2. Each implemented area indicates a 32-byte region where at least one address is implemented as an SFR. A complete listing of implemented SFRs, including their addresses, is shown in Tables 4-3 through 4-26.

TABLE 4-2: IMPLEMENTED REGIONS OF SFR DATA SPACE

	SFR Space Address							
	xx00	**xx20**	**xx40**	**xx60**	**xx80**	**xxA0**	**xxC0**	**xxE0**
000h	Core			ICN	Interrupts			—
100h	Timers		Capture		Compare			—
200h	I^2C™	UART	SPI	—	—	—	I/O	
300h	A/D	A/D/CTMU	—	—	—	—	—	—
400h	—	—	—	—	—	—	—	—
500h	—	—	—	—	—	—	—	—
600h	PMP	RTCC	CRC/Comp	Comparators	PPS			—
700h	—	—	System/DS	NVM/PMD	—	—	—	—

Legend: — = No implemented SFRs in this block

6.2.1 POR AND LONG OSCILLATOR START-UP TIMES

The oscillator start-up circuitry and its associated delay timers are not linked to the device Reset delays that occur at power-up. Some crystal circuits (especially low-frequency crystals) will have a relatively long start-up time. Therefore, one or more of the following conditions is possible after SYSRST is released:

- The oscillator circuit has not begun to oscillate.
- The Oscillator Start-up Timer has not expired (if a crystal oscillator is used).
- The PLL has not achieved a lock (if PLL is used).

The device will not begin to execute code until a valid clock source has been released to the system. Therefore, the oscillator and PLL start-up delays must be considered when the Reset delay time must be known.

6.2.2 FAIL-SAFE CLOCK MONITOR (FSCM) AND DEVICE RESETS

If the FSCM is enabled, it will begin to monitor the system clock source when SYSRST is released. If a valid clock source is not available at this time, the device will automatically switch to the FRC Oscillator and the user can switch to the desired crystal oscillator in the Trap Service Routine (TSR).

6.3 Special Function Register Reset States

Most of the Special Function Registers (SFRs) associated with the PIC24F CPU and peripherals are reset to a particular value at a device Reset. The SFRs are grouped by their peripheral or CPU function and their Reset values are specified in each section of this manual.

The Reset value for each SFR does not depend on the type of Reset with the exception of four registers. The Reset value for the Reset Control register, RCON, will depend on the type of device Reset. The Reset value for the Oscillator Control register, OSCCON, will depend on the type of Reset and the programmed values of the FNOSC bits in Flash Configuration Word 2 (CW2); see Table 6-2. The RCFGCAL and NVMCON registers are only affected by a POR.

6.4 Deep Sleep BOR (DSBOR)

Deep Sleep BOR is a very low-power BOR circuitry, used when the device is in Deep Sleep mode. Due to low-current consumption, accuracy may vary.

The DSBOR trip point is around 2.0V. DSBOR is enabled by configuring CW4 (DSBOREN) = 1. DSBOR will re-arm the POR to ensure the device will reset if V_{DD} drops below the POR threshold.

TABLE 7-2: IMPLEMENTED INTERRUPT VECTORS

Interrupt Source	Vector Number	IVT Address	AIVT Address	Interrupt Bit Locations

8.5 Secondary Oscillator (SOSC)

8.5.1 BASIC SOSC OPERATION

PIC24FJ64GA104 family devices do not have to set the SOSCEN bit to use the Secondary Oscillator. Any module requiring the SOSC (such as RTCC, Timer1 or DSWDT) will automatically turn on the SOSC when the clock signal is needed. The SOSC, however, has a long start-up time. To avoid delays for peripheral start-up, the SOSC can be manually started using the SOSCEN bit.

To use the Secondary Oscillator, the SOSCSEL<1:0> bits (CW3<9:8>) must be configured in an oscillator mode – either '11' or '01'. Setting SOSCSEL to '00' configures the SOSC pins for Digital mode, enabling digital I/O functionality on the pins. Digital functionality will not be available if the SOSC is configured in either of the oscillator modes.

8.5.2 LOW-POWER SOSC OPERATION

The Secondary Oscillator can operate in two distinct levels of power consumption based on device configuration. In Low-Power mode, the oscillator operates in a low drive strength, low-power state. By default, the oscillator uses a higher drive strength, and therefore, requires more power. The Secondary Oscillator Mode Configuration bits, SOSCSEL<1:0> (CW3<9:8>), determine the oscillator's power mode. Programming the SOSCSEL bits to '01' selects low-power operation.

The lower drive strength of this mode makes the SOSC more sensitive to noise and requires a longer start-up time. When Low-Power mode is used, care must be taken in the design and layout of the SOSC circuit to ensure that the oscillator starts up and oscillates properly.

8.5.3 EXTERNAL (DIGITAL) CLOCK MODE (SCLKI)

The SOSC can also be configured to run from an external 32 kHz clock source, rather than the internal oscillator. In this mode, also referred to as Digital mode, the clock source provided on the SCLKI pin is used to clock any modules that are configured to use the Secondary Oscillator. In this mode, the crystal driving circuit is disabled and the SOSCEN bit (OSCCON<1>) has no effect.

8.5.4 SOSC LAYOUT CONSIDERATIONS

The pinout limitations on low pin count devices, such as those in the PIC24FJ64GA104 family, may make the SOSC more susceptible to noise than other PIC24F devices. Unless proper care is taken in the design and layout of the SOSC circuit, this external noise may introduce inaccuracies into the oscillator's period.

In general, the crystal circuit connections should be as short as possible. It is also good practice to surround the crystal circuit with a ground loop or ground plane. For more information on crystal circuit design, please refer to **Section 6 "Oscillator"** (DS39700) of the "*PIC24F Family Reference Manual"*. Additional information is also available in these Microchip Application Notes:

- *AN826,* "*Crystal Oscillator Basics and Crystal Selection for rfPIC® and PICmicro® Devices" (*DS00826)
- *AN849, "Basic PICmicro® Oscillator Design"* (DS00849).

8.6 Reference Clock Output

In addition to the CLKO output (FOSC/2) available in certain oscillator modes, the device clock in the PIC24FJ64GA104 family devices can also be configured to provide a reference clock output signal to a port pin. This feature is available in all oscillator configurations and allows the user to select a greater range of clock submultiples to drive external devices in the application.

This reference clock output is controlled by the REFOCON register (Register 8-4). Setting the ROEN bit (REFOCON<15>) makes the clock signal available on the REFO pin. The RODIV bits (REFOCON<11:8>) enable the selection of 16 different clock divider options.

The ROSSLP and ROSEL bits (REFOCON<13:12>) control the availability of the reference output during Sleep mode. The ROSEL bit determines if the oscillator on OSC1 and OSC2, or the current system clock source, is used for the reference clock output. The ROSSLP bit determines if the reference source is available on REFO when the device is in Sleep mode.

To use the reference clock output in Sleep mode, both the ROSSLP and ROSEL bits must be set. The device clock must also be configured for one of the primary modes (EC, HS or XT); otherwise, if the POSCEN bit is not also set, the oscillator on OSC1 and OSC2 will be powered down when the device enters Sleep mode. Clearing the ROSEL bit allows the reference output frequency to change as the system clock changes during any clock switches.

0000 = Base clock value

bit 7-0 **Unimplemented:** Read as ‘0’

REGISTER 13-1: ICxCON1: INPUT CAPTURE x CONTROL REGISTER 1

U-0	U-0	R/W-0	R/W-0	R/W-0	R/W-0	U-0	U-0
—	—	ICSIDL	ICTSEL2	ICTSEL1	ICTSEL0	—	—
bit 15							bit 8

U-0	R/W-0	R/W-0	R-0, HCS	R-0, HCS	R/W-0	R/W-0	R/W-0
—	ICI1	ICI0	ICOV	ICBNE	ICM2(1)	ICM1(1)	ICM0(1)
bit 7							bit 0

Legend:	HCS = Hardware Clearable/Settable bit		
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 15-14 **Unimplemented:** Read as '0'

bit 13 **ICSIDL:** Input Capture x Module Stop in Idle Control bit
1 = Input capture module halts in CPU Idle mode
0 = Input capture module continues to operate in CPU Idle mode

bit 12-10 **ICTSEL<2:0>:** Input Capture Timer Select bits
111 = System clock (FOSC/2)
110 = Reserved
101 = Reserved
100 = Timer1
011 = Timer5
010 = Timer4
001 = Timer2
000 = Timer3

bit 9-7 **Unimplemented:** Read as '0'

bit 6-5 **ICI<1:0>:** Select Number of Captures per Interrupt bits
11 = Interrupt on every fourth capture event
10 = Interrupt on every third capture event
01 = Interrupt on every second capture event
00 = Interrupt on every capture event

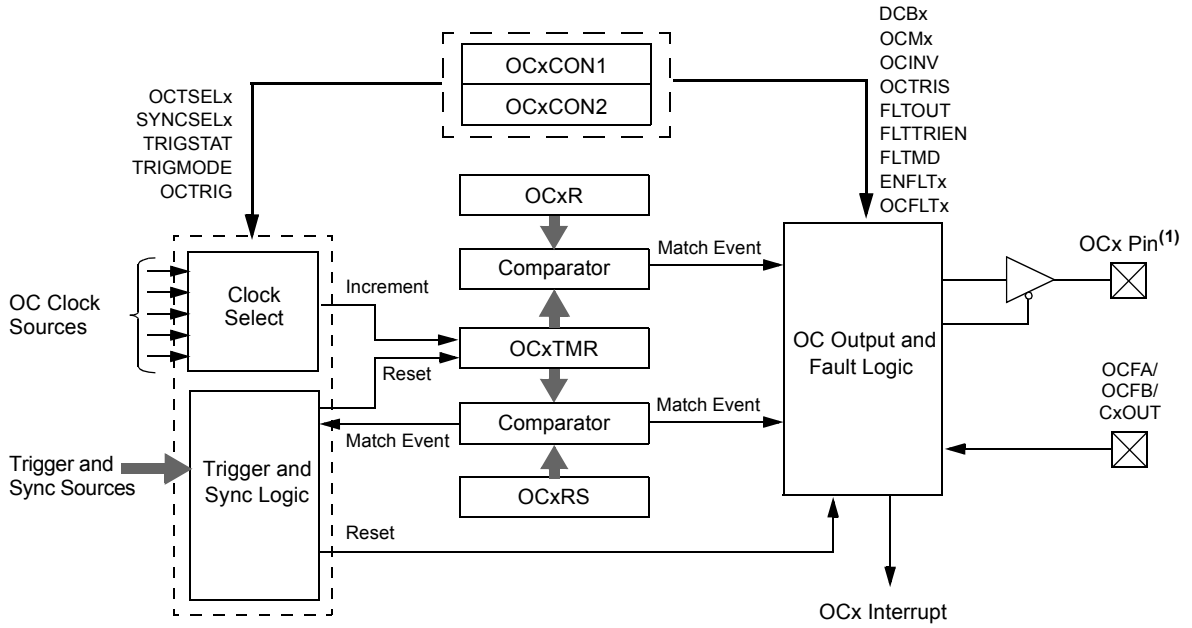
bit 4 **ICOV:** Input Capture x Overflow Status Flag bit (read-only)
1 = Input capture overflow occurred
0 = No input capture overflow occurred

bit 3 **ICBNE:** Input Capture x Buffer Empty Status bit (read-only)
1 = Input capture buffer is not empty, at least one more capture value can be read
0 = Input capture buffer is empty

bit 2-0 **ICM<2:0>:** Input Capture Mode Select bits(1)
111 = Interrupt mode: input capture functions as interrupt pin only when device is in Sleep or Idle mode (rising edge detect only, all other control bits are not applicable)
110 = Unused (module disabled)
101 = Prescaler Capture mode: capture on every 16th rising edge
100 = Prescaler Capture mode: capture on every 4th rising edge
011 = Simple Capture mode: capture on every rising edge
010 = Simple Capture mode: capture on every falling edge
001 = Edge Detect Capture mode: capture on every edge (rising and falling); ICI<1:0 bits do not control interrupt generation for this mode
000 = Input capture module turned off

Note 1: The ICx input must also be configured to an available RPn pin. For more information, see **Section 10.4 "Peripheral Pin Select (PPS)"**.

FIGURE 14-1: OUTPUT COMPARE BLOCK DIAGRAM (16-BIT MODE)



Note 1: The OCx outputs must be assigned to an available RPn pin before use. Please see **Section 10.4 "Peripheral Pin Select (PPS)"** for more information.

To set up the SPI module for the Standard Master mode of operation:

1. If using interrupts:
   a) Clear the SPIxIF bit in the respective IFS register.
   b) Set the SPIxIE bit in the respective IEC register.
   c) Write the SPIxIP bits in the respective IPC register to set the interrupt priority.
2. Write the desired settings to the SPIxCON1 and SPIxCON2 registers with MSTEN (SPIxCON1<5>) = 1.
3. Clear the SPIROV bit (SPIxSTAT<6>).
4. Enable SPI operation by setting the SPIEN bit (SPIxSTAT<15>).
5. Write the data to be transmitted to the SPIxBUF register. Transmission (and reception) will start as soon as data is written to the SPIxBUF register.

To set up the SPI module for the Standard Slave mode of operation:

1. Clear the SPIxBUF register.
2. If using interrupts:
   a) Clear the SPIxIF bit in the respective IFS register.
   b) Set the SPIxIE bit in the respective IEC register.
   c) Write the SPIxIP bits in the respective IPC register to set the interrupt priority.
3. Write the desired settings to the SPIxCON1 and SPIxCON2 registers with MSTEN (SPIxCON1<5>) = 0.
4. Clear the SMP bit.
5. If the CKE bit (SPIxCON1<8>) is set, then the SSEN bit (SPIxCON1<7>) must be set to enable the $\overline{SSx}$ pin.
6. Clear the SPIROV bit (SPIxSTAT<6>).
7. Enable SPI operation by setting the SPIEN bit (SPIxSTAT<15>).

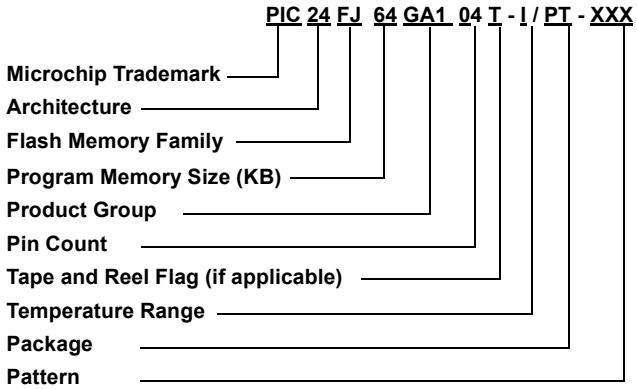
PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.



Architecture	24	= 16-bit modified Harvard without DSP
Flash Memory Family	FJ	= Flash program memory
Product Group	GA1	= General purpose microcontrollers
Pin Count	02 04	= 28-pin = 44-pin
Temperature Range	I E	= -40°C to +85°C (Industrial) = -40°C to +125°C (Extended)
Package	ML PT SO SP SS	= 28-lead (6x6 mm) or 44-lead (8x8 mm) QFN (Quad Flat) = 44-lead (10x10x1 mm) TQFP (Thin Quad Flatpack) = 28-lead (7.50 mm wide) SOIC (Small Outline) = 28-lead (300 mil) SPDIP (Skinny Plastic Dual In-Line) = 28-lead (530 mm) SSOP (Plastic Shrink Small)
Pattern	Three-digit QTP, SQTP, Code or Special Requirements (blank otherwise) ES	= Engineering Sample

Examples:

a) PIC24FJ64GA104-I/PT:
PIC24F device with, 64-Kbyte program memory, 44-pin, Industrial temp., TQFP package.

b) PIC24FJ32GA102-I/ML:
PIC24F device with32-Kbyte program memory, 28-pin, Industrial temp.,QFN package.
