Welcome to E-XFL.COM

Understanding Embedded - Microprocessors

Embedded microprocessors are specialized computing chips designed to perform specific tasks within an embedded system. Unlike general-purpose microprocessors found in personal computers, embedded microprocessors are tailored for dedicated functions within larger systems, offering optimized performance, efficiency, and reliability. These microprocessors are integral to the operation of countless electronic devices, providing the computational power necessary for controlling processes, handling data, and managing communications.

Applications of Embedded - Microprocessors

Embedded microprocessors are utilized across a broad spectrum of applications, making them indispensable in

Details	
Product Status	Obsolete
Core Processor	PowerPC e300
Number of Cores/Bus Width	1 Core, 32-Bit
Speed	400MHz
Co-Processors/DSP	Communications; QUICC Engine
RAM Controllers	DDR, DDR2
Graphics Acceleration	No
Display & Interface Controllers	-
Ethernet	10/100/1000Mbps (1)
SATA	-
USB	USB 1.x (1)
Voltage - I/O	1.8V, 2.5V, 3.3V
Operating Temperature	-40°C ~ 105°C (TA)
Security Features	-
Package / Case	740-LBGA
Supplier Device Package	740-TBGA (37.5x37.5)
Purchase URL	https://www.e-xfl.com/product-detail/nxp-semiconductors/kmpc8358cvvagdg

2.1 Overall DC Electrical Characteristics

This section covers the ratings, conditions, and other characteristics.

2.1.1 Absolute Maximum Ratings

This table provides the absolute maximum ratings.

Table 1. Absolute Maximum Ratings[1]

Characteristic		Symbol	Max Value	Unit	Notes
Core and PLL supply voltage for MPC8358 Device Part Number with Processor Frequency label of AD=266MHz and AG=400MHz & QUICC Engine Frequency label of E=300MHz & G=400MHz MPC8360 Device Part Number with Processor Frequency label of AG=400MHz and AJ=533MHz & QUICC Engine Frequency label of G=400MHz		V_{DD} & AV_{DD}	–0.3 to 1.32	V	—
Core and PLL supply voltage for MPC8360 device Part Number with Processor Frequency label of AL=667MHz and QUICC Engine Frequency label of H=500MHz		V_{DD} & AV_{DD}	–0.3 to 1.37	V	—
DDR and DDR2 DRAM I/O voltage DDR DDR2		GV_{DD}	 –0.3 to 2.75 –0.3 to 1.89	V	—
Three-speed Ethernet I/O, MII management voltage		LV_{DD}	–0.3 to 3.63	V	—
PCI, local bus, DUART, system control and power management, I^2C, SPI, and JTAG I/O voltage		OV_{DD}	–0.3 to 3.63	V	—
Input voltage	DDR DRAM signals	MV_{IN}	–0.3 to (GV_{DD} + 0.3)	V	2, 5
	DDR DRAM reference	MV_{REF}	–0.3 to (GV_{DD} + 0.3)	V	2, 5
	Three-speed Ethernet signals	LV_{IN}	–0.3 to (LV_{DD} + 0.3)	V	4, 5
	Local bus, DUART, CLKIN, system control and power management, I^2C, SPI, and JTAG signals	OV_{IN}	–0.3 to (OV_{DD} + 0.3)	V	3, 5
	PCI	OV_{IN}	–0.3 to (OV_{DD} + 0.3)	V	6

Table 4. MPC8360E TBGA Core Power Dissipation[1] (continued)

Core Frequency (MHz)	CSB Frequency (MHz)	QUICC Engine Frequency (MHz)	Typical	Maximum	Unit	Notes
667	333	500	6.1	6.8	W	2, 3, 5, 9

Notes:

1. The values do not include I/O supply power (OV_{DD}, LV_{DD}, GV_{DD}) or AV_{DD}. For I/O power values, see Table 6.
2. Typical power is based on a voltage of V_{DD} = 1.2 V or 1.3 V, a junction temperature of T_J = 105° C, and a Dhrystone benchmark application.
3. Thermal solutions need to design to a value higher than typical power on the end application, T_A target, and I/O power.
4. Maximum power is based on a voltage of V_{DD} = 1.2 V, WC process, a junction T_J = 105° C, and an artificial smoke test.
5. Maximum power is based on a voltage of V_{DD} = 1.3 V for applications that use 667 MHz (CPU)/500 (QE) with WC process, a junction T_J = 105° C, and an artificial smoke test.
6. Typical power is based on a voltage of V_{DD} = 1.3 V, a junction temperature of T_J = 70° C, and a Dhrystone benchmark application.
7. Maximum power is based on a voltage of V_{DD} = 1.3 V for applications that use 667 MHz (CPU) or 500 (QE) with WC process, a junction T_J = 70° C, and an artificial smoke test.
8. This frequency combination is only available for rev. 2.0 silicon.
9. This frequency combination is not available for rev. 2.0 silicon.

Table 5. MPC8358E TBGA Core Power Dissipation[1]

Core Frequency (MHz)	CSB Frequency (MHz)	QUICC Engine Frequency (MHz)	Typical	Maximum	Unit	Notes
266	266	300	4.1	4.5	W	2, 3, 4
400	266	400	4.5	5.0	W	2, 3, 4

Notes:

1. The values do not include I/O supply power (OV_{DD}, LV_{DD}, GV_{DD}) or AV_{DD}. For I/O power values, see Table 6.
2. Typical power is based on a voltage of V_{DD} = 1.2 V, a junction temperature of T_J = 105° C, and a Dhrystone benchmark application.
3. Thermal solutions need to design to a value higher than typical power on the end application, T_A target, and I/O power.
4. Maximum power is based on a voltage of V_{DD} = 1.2 V, WC process, a junction T_J = 105° C, and an artificial smoke test.

6.1 DDR and DDR2 SDRAM DC Electrical Characteristics

This table provides the recommended operating conditions for the DDR2 SDRAM component(s) of the device when GV_{DD}(typ) = 1.8 V.

Table 14. DDR2 SDRAM DC Electrical Characteristics for GV_{DD}(typ) = 1.8 V

Parameter/Condition	Symbol	Min	Max	Unit	Notes
I/O supply voltage	GV_{DD}	1.71	1.89	V	1
I/O reference voltage	MV_{REF}	0.49 × GV_{DD}	0.51 × GV_{DD}	V	2
I/O termination voltage	V_{TT}	MV_{REF} – 0.04	MV_{REF} + 0.04	V	3
Input high voltage	V_{IH}	MV_{REF} + 0.125	GV_{DD} + 0.3	V	—
Input low voltage	V_{IL}	–0.3	MV_{REF} – 0.125	V	—
Output leakage current	I_{OZ}	—	±10	μA	4
Output high current (V_{OUT} = 1.420 V)	I_{OH}	–13.4	—	mA	—
Output low current (V_{OUT} = 0.280 V)	I_{OL}	13.4	—	mA	—
MV_{REF} input leakage current	I_{VREF}	—	±10	μA	—
Input current (0 V ≤ V_{IN} ≤ OV_{DD})	I_{IN}	—	±10	μA	—

Notes:
1. GV_{DD} is expected to be within 50 mV of the DRAM GV_{DD} at all times.
2. MV_{REF} is expected to equal 0.5 × GV_{DD}, and to track GV_{DD} DC variations as measured at the receiver. Peak-to-peak noise on MV_{REF} cannot exceed ±2% of the DC value.
3. V_{TT} is not applied directly to the device. It is the supply to which far end signal termination is made and is expected to equal MV_{REF}. This rail should track variations in the DC level of MV_{REF}.
4. Output leakage is measured with all outputs disabled, 0 V ≤ V_{OUT} ≤ GV_{DD}.

This table provides the DDR2 capacitance when GV_{DD}(typ) = 1.8 V.

Table 15. DDR2 SDRAM Capacitance for GV_{DD}(typ)=1.8 V

Parameter/Condition	Symbol	Min	Max	Unit	Notes
Input/output capacitance: DQ, DQS, $\overline{DQS}$	C_{IO}	6	8	pF	1
Delta input/output capacitance: DQ, DQS, $\overline{DQS}$	C_{DIO}	—	0.5	pF	1

Note:
1. This parameter is sampled. GV_{DD} = 1.8 V ± 0.090 V, f = 1 MHz, T_A = 25°C, V_{OUT} = GV_{DD}/2, V_{OUT} (peak-to-peak) = 0.2 V.

This table provides the recommended operating conditions for the DDR SDRAM component(s) of the device when GV_{DD}(typ) = 2.5 V.

Table 16. DDR SDRAM DC Electrical Characteristics for GV_{DD}(typ) = 2.5 V

Parameter/Condition	Symbol	Min	Max	Unit	Notes
I/O supply voltage	GV_{DD}	2.375	2.625	V	1
I/O reference voltage	MV_{REF}	0.49 × GV_{DD}	0.51 × GV_{DD}	V	2
I/O termination voltage	V_{TT}	MV_{REF} – 0.04	MV_{REF} + 0.04	V	3

Table 21. DDR and DDR2 SDRAM Output AC Timing Specifications for Source Synchronous Mode (continued)

At recommended operating conditions with GV_{DD} of (1.8 V or 2.5 V) ± 5%.

Parameter[8]	Symbol[1]	Min	Max	Unit	Notes
MDQS epilogue end	t_{DDKHME}	–0.6	0.9	ns	7

Notes:

1. The symbols used for timing specifications follow the pattern of $t_{(first\ two\ letters\ of\ functional\ block)(signal)(state)(reference)(state)}$ for inputs and $t_{(first\ two\ letters\ of\ functional\ block)(reference)(state)(signal)(state)}$ for outputs. Output hold time can be read as DDR timing (DD) from the rising or falling edge of the reference clock (KH or KL) until the output went invalid (AX or DX). For example, t_{DDKHAS} symbolizes DDR timing (DD) for the time t_{MCK} memory clock reference (K) goes from the high (H) state until outputs (A) are setup (S) or output valid time. Also, t_{DDKLDX} symbolizes DDR timing (DD) for the time t_{MCK} memory clock reference (K) goes low (L) until data outputs (D) are invalid (X) or data output hold time.
2. All MCK/$\overline{MCK}$ referenced measurements are made from the crossing of the two signals ±0.1 V.
3. In the source synchronous mode, MCK/$\overline{MCK}$ can be shifted in ¼ applied cycle increments through the clock control register. For the skew measurements referenced for t_{AOSKEW} it is assumed that the clock adjustment is set to align the address/command valid with the rising edge of MCK.
4. ADDR/CMD includes all DDR SDRAM output signals except MCK/$\overline{MCK}$, $\overline{MCS}$, and MDQ/MECC/MDM/MDQS. For the ADDR/CMD setup and hold specifications, it is assumed that the clock control register is set to adjust the memory clocks by ½ applied cycle.
5. Note that t_{DDKHMH} follows the symbol conventions described in note 1. For example, t_{DDKHMH} describes the DDR timing (DD) from the rising edge of the MCK(n) clock (KH) until the MDQS signal is valid (MH). t_{DDKHMH} can be modified through control of the DQSS override bits in the TIMING_CFG_2 register. In source synchronous mode, this is typically set to the same delay as the clock adjust in the CLK_CNTL register. The timing parameters listed in the table assume that these two parameters have been set to the same adjustment value. Refer *MPC8360E PowerQUICC II Pro Integrated Communications Processor Reference Manual* for a description and understanding of the timing modifications enabled by use of these bits.
6. Determined by maximum possible skew between a data strobe (MDQS) and any corresponding bit of data (MDQ), ECC (MECC), or data mask (MDM). The data strobe should be centered inside of the data eye at the pins of the device.
7. All outputs are referenced to the rising edge of MCK(n) at the pins of the device. Note that t_{DDKHMP} follows the symbol conventions described in note 1.
8. AC timing values are based on the DDR data rate, which is twice the DDR memory bus frequency.
9. In rev. 2.0 silicon, t_{DDKHMH} maximum meets the specification of 0.6 ns. In rev. 2.0 silicon, due to errata, t_{DDKHMH} minimum is –0.9 ns. Refer to Errata DDR18 in *Chip Errata for the MPC8360E, Rev. 1*.

This figure shows the DDR SDRAM output timing for address skew with respect to any MCK.

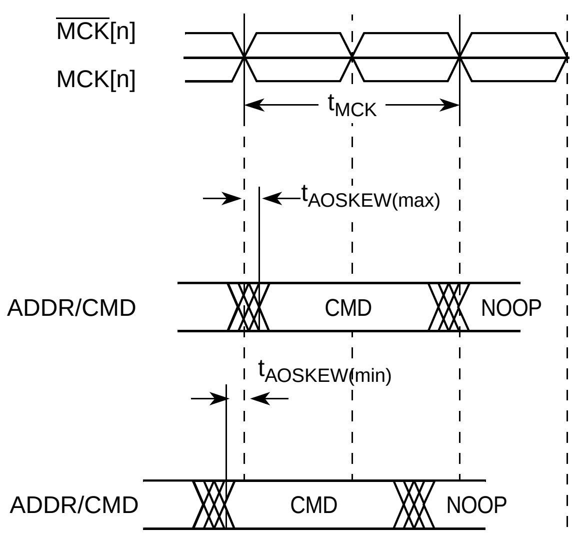

Figure 7. Timing Diagram for t_{AOSKEW} Measurement

8.2.4.1 TBI Transmit AC Timing Specifications

This table provides the TBI transmit AC timing specifications.

Table 33. TBI Transmit AC Timing Specifications

At recommended operating conditions with LV_{DD}/OV_{DD} of 3.3 V ± 10%.

Parameter/Condition	Symbol[1]	Min	Typ	Max	Unit	Notes
GTX_CLK clock period	t_{TTX}	—	8.0	—	ns	—
GTX_CLK duty cycle	t_{TTXH}/t_{TTX}	40	—	60	%	—
GTX_CLK to TBI data TCG[9:0] delay	t_{TTKHDX} t_{TTKHDV}	1.0 —	—	— 5.0	ns	3
GTX_CLK clock rise time, (20% to 80%)	t_{TTXR}	—	—	1.0	ns	—
GTX_CLK clock fall time, (80% to 20%)	t_{TTXF}	—	—	1.0	ns	—
GTX_CLK125 reference clock period	t_{G125}	—	8.0	—	ns	2
GTX_CLK125 reference clock duty cycle	t_{G125H}/t_{G125}	45	—	55	ns	—

Notes:

1. The symbols used for timing specifications follow the pattern of $t_{\text{(first two letters of functional block)(signal)(state)(reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, t_{TTKHDV} symbolizes the TBI transmit timing (TT) with respect to the time from t_{TTX} (K) going high (H) until the referenced data signals (D) reach the valid state (V) or setup time. Also, t_{TTKHDX} symbolizes the TBI transmit timing (TT) with respect to the time from t_{TTX} (K) going high (H) until the referenced data signals (D) reach the invalid state (X) or hold time. Note that, in general, the clock reference symbol representation is based on three letters representing the clock of a particular functional. For example, the subscript of t_{TTX} represents the TBI (T) transmit (TX) clock. For rise and fall times, the latter convention is used with the appropriate letter: R (rise) or F (fall).
2. This symbol is used to represent the external GTX_CLK125 and does not follow the original symbol naming convention.
3. In rev. 2.0 silicon, due to errata, t_{TTKHDX} minimum is 0.7 ns for UCC1. Refer to Errata *QE_ENET19* in *Chip Errata for the MPC8360E, Rev. 1*.

This figure shows the TBI transmit AC timing diagram.

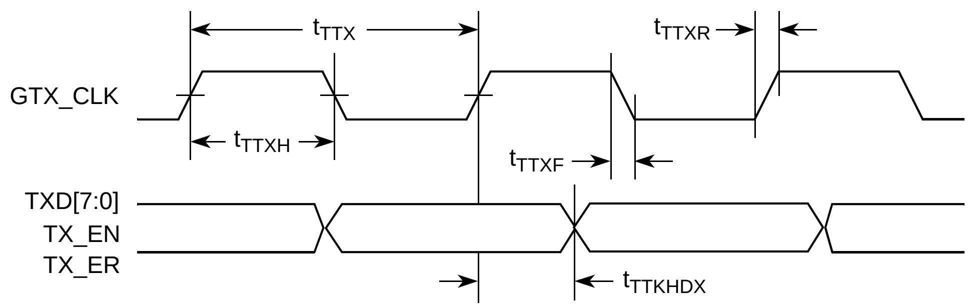

Figure 18. TBI Transmit AC Timing Diagram

8.2.4.2 TBI Receive AC Timing Specifications

This table provides the TBI receive AC timing specifications.

Table 34. TBI Receive AC Timing Specifications

At recommended operating conditions with LV_{DD}/OV_{DD} of 3.3 V ± 10%.

Parameter/Condition	Symbol[1]	Min	Typ	Max	Unit	Notes
PMA_RX_CLK clock period	t_{TRX}	—	16.0	—	ns	—
PMA_RX_CLK skew	t_{SKTRX}	7.5	—	8.5	ns	—
RX_CLK duty cycle	t_{TRXH}/t_{TRX}	40	—	60	%	—
RCG[9:0] setup time to rising PMA_RX_CLK	t_{TRDVKH}	2.5	—	—	ns	2
RCG[9:0] hold time to rising PMA_RX_CLK	t_{TRDXKH}	1.0	—	—	ns	2
RX_CLK clock rise time, V_{IL}(min) to V_{IH}(max)	t_{TRXR}	0.7	—	2.4	ns	—
RX_CLK clock fall time, V_{IH}(max) to V_{IL}(min)	t_{TRXF}	0.7	—	2.4	ns	—

Notes:

1. The symbols used for timing specifications follow the pattern of $t_{\text{(first two letters of functional block)(signal)(state)(reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, t_{TRDVKH} symbolizes TBI receive timing (TR) with respect to the time data input signals (D) reach the valid state (V) relative to the t_{TRX} clock reference (K) going to the high (H) state or setup time. Also, t_{TRDXKH} symbolizes TBI receive timing (TR) with respect to the time data input signals (D) went invalid (X) relative to the t_{TRX} clock reference (K) going to the high (H) state. Note that, in general, the clock reference symbol representation is based on three letters representing the clock of a particular functional. For example, the subscript of t_{TRX} represents the TBI (T) receive (RX) clock. For rise and fall times, the latter convention is used with the appropriate letter: R (rise) or F (fall). For symbols representing skews, the subscript is skew (SK) followed by the clock that is being skewed (TRX).
2. Setup and hold time of even numbered RCG are measured from riding edge of PMA_RX_CLK1. Setup and hold time of odd numbered RCG are measured from riding edge of PMA_RX_CLK0.

This figure shows the TBI receive AC timing diagram.

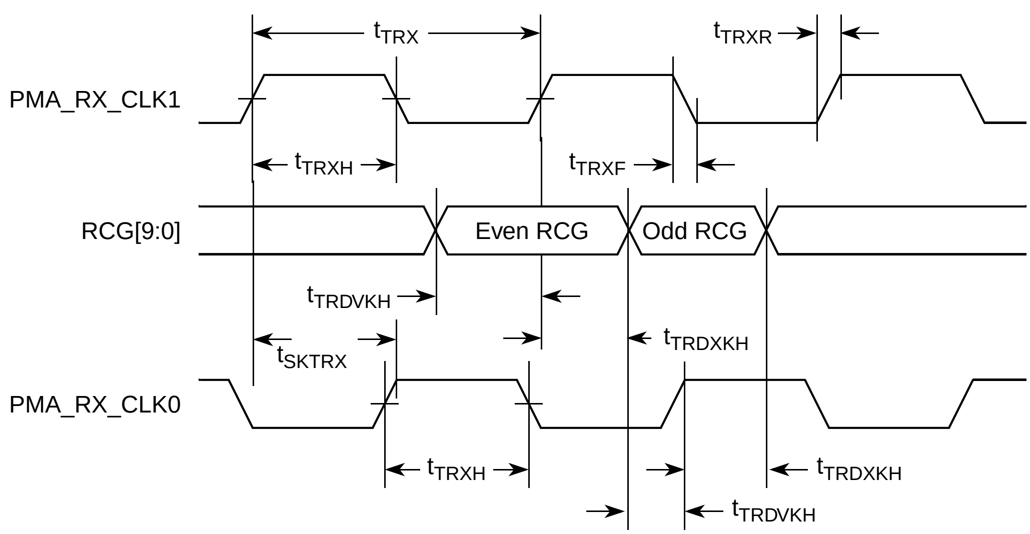

Figure 19. TBI Receive AC Timing Diagram

8.2.5 RGMII and RTBI AC Timing Specifications

This table presents the RGMII and RTBI AC timing specifications.

Table 35. RGMII and RTBI AC Timing Specifications

At recommended operating conditions with LV_{DD} of 2.5 V ± 5%.

Parameter/Condition	Symbol[1]	Min	Typ	Max	Unit	Notes
Data to clock output skew (at transmitter)	$t_{SKRGTKHDX}$ $t_{SKRGTKHDV}$	–0.5 —	—	— 0.5	ns	7
Data to clock input skew (at receiver)	$t_{SKRGDXKH}$ $t_{SKRGDVKH}$	1.0 —	—	— 2.6	ns	2
Clock cycle duration	t_{RGT}	7.2	8.0	8.8	ns	3
Duty cycle for 1000Base-T	t_{RGTH}/t_{RGT}	45	50	55	%	4, 5
Duty cycle for 10BASE-T and 100BASE-TX	t_{RGTH}/t_{RGT}	40	50	60	%	3, 5
Rise time (20–80%)	t_{RGTR}	—	—	0.75	ns	—
Fall time (20–80%)	t_{RGTF}	—	—	0.75	ns	—
GTX_CLK125 reference clock period	t_{G125}	—	8.0	—	ns	6
GTX_CLK125 reference clock duty cycle	t_{G125H}/t_{G125}	47	—	53	%	—

Notes:

1. Note that, in general, the clock reference symbol representation for this section is based on the symbols RGT to represent RGMII and RTBI timing. For example, the subscript of t_{RGT} represents the TBI (T) receive (Rx) clock. Note also that the notation for rise (R) and fall (F) times follows the clock symbol that is being represented. For symbols representing skews, the subscript is skew (SK) followed by the clock that is being skewed (RGT).
2. This implies that PC board design requires clocks to be routed such that an additional trace delay of greater than 1.5 ns can be added to the associated clock signal.
3. For 10 and 100 Mbps, t_{RGT} scales to 400 ns ± 40 ns and 40 ns ± 4 ns, respectively.
4. Duty cycle may be stretched/shrunk during speed changes or while transitioning to a received packet's clock domains as long as the minimum duty cycle is not violated and stretching occurs for no more than three t_{RGT} of the lowest speed transitioned between.
5. Duty cycle reference is $LV_{DD}/2$.
6. This symbol is used to represent the external GTX_CLK125 and does not follow the original symbol naming convention.
7. In rev. 2.0 silicon, due to errata, $t_{SKRGTKHDX}$ minimum is –2.3 ns and $t_{SKRGTKHDV}$ maximum is 1 ns for UCC1, 1.2 ns for UCC2 option 1, and 1.8 ns for UCC2 option 2. In rev. 2.1 silicon, due to errata, $t_{SKRGTKHDX}$ minimum is –0.65 ns for UCC2 option 1 and –0.9 for UCC2 option 2, and $t_{SKRGTKHDV}$ maximum is 0.75 ns for UCC1 and UCC2 option 1 and 0.85 for UCC2 option 2. Refer to Errata QE_ENET10 in *Chip Errata for the MPC8360E, Rev. 1*. UCC1 does meet $t_{SKRGTKHDX}$ minimum for rev. 2.1 silicon.

8.3.3 IEEE 1588 Timer AC Specifications

This table provides the IEEE 1588 timer AC specifications.

Table 38. IEEE 1588 Timer AC Specifications

Parameter	Symbol	Min	Max	Unit	Notes
Timer clock frequency	t_{TMRCK}	0	70	MHz	1
Input setup to timer clock	t_{TMRCKS}	—	—	—	2, 3
Input hold from timer clock	t_{TMRCKH}	—	—	—	2, 3
Output clock to output valid	t_{GCLKNV}	0	6	ns	—
Timer alarm to output valid	t_{TMRAL}	—	—	—	2

Notes:
1. The timer can operate on rtc_clock or tmr_clock. These clocks get muxed and any one of them can be selected. The minimum and maximum requirement for both rtc_clock and tmr_clock are the same.
2. These are asynchronous signals.
3. Inputs need to be stable at least one TMR clock.

9 Local Bus

This section describes the DC and AC electrical specifications for the local bus interface of the MPC8360E/58E.

9.1 Local Bus DC Electrical Characteristics

This table provides the DC electrical characteristics for the local bus interface.

Table 39. Local Bus DC Electrical Characteristics

Parameter	Symbol	Min	Max	Unit
High-level input voltage	V_{IH}	2	OV_{DD} + 0.3	V
Low-level input voltage	V_{IL}	–0.3	0.8	V
High-level output voltage, I_{OH} = –100 µA	V_{OH}	OV_{DD} – 0.4	—	V
Low-level output voltage, I_{OL} = 100 µA	V_{OL}	—	0.2	V
Input current	I_{IN}	—	±10	µA

9.2 Local Bus AC Electrical Specifications

This table describes the general timing parameters of the local bus interface of the device.

Table 40. Local Bus General Timing Parameters—DLL Enabled

Parameter	Symbol[1]	Min	Max	Unit	Notes
Local bus cycle time	t_{LBK}	7.5	—	ns	2
Input setup to local bus clock (except LUPWAIT)	$t_{LBIVKH1}$	1.7	—	ns	3, 4
LUPWAIT input setup to local bus clock	$t_{LBIVKH2}$	1.9	—	ns	3, 4
Input hold from local bus clock (except LUPWAIT)	$t_{LBIXKH1}$	1.0	—	ns	3, 4

10.2 JTAG AC Electrical Characteristics

This section describes the AC electrical specifications for the IEEE 1149.1 (JTAG) interface of the device.

This table provides the JTAG AC timing specifications as defined in Figure 30 through Figure 33.

Table 43. JTAG AC Timing Specifications (Independent of CLKIN)[1]

At recommended operating conditions (see Table 2).

Parameter	Symbol [2]	Min	Max	Unit	Notes
JTAG external clock frequency of operation	f_{JTG}	0	33.3	MHz	—
JTAG external clock cycle time	t_{JTG}	30	—	ns	—
JTAG external clock duty cycle	t_{JTKHKL}/t_{JTG}	45	55	%	—
JTAG external clock rise and fall times	t_{JTGR} & t_{JTGF}	0	2	ns	—
$\overline{\text{TRST}}$ assert time	t_{TRST}	25	—	ns	3
Input setup times: Boundary-scan data TMS, TDI	 t_{JTDVKH} t_{JTIVKH}	 4 4	 — —	ns	4
Input hold times: Boundary-scan data TMS, TDI	 t_{JTDXKH} t_{JTIXKH}	 10 10	 — —	ns	4
Valid times: Boundary-scan data TDO	 t_{JTKLDV} t_{JTKLOV}	 2 2	 11 11	ns	5
Output hold times: Boundary-scan data TDO	 t_{JTKLDX} t_{JTKLOX}	 2 2	 — —	ns	5
JTAG external clock to output high impedance: Boundary-scan data TDO	 t_{JTKLDZ} t_{JTKLOZ}	 2 2	 19 9	ns	5, 6

Notes:

1. All outputs are measured from the midpoint voltage of the falling/rising edge of t_{TCLK} to the midpoint of the signal in question. The output timings are measured at the pins. All output timings assume a purely resistive 50-Ω load (see Figure 22). Time-of-flight delays must be added for trace lengths, vias, and connectors in the system.
2. The symbols used for timing specifications herein follow the pattern of $t_{\text{(first two letters of functional block)(signal)(state)(reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, t_{JTDVKH} symbolizes JTAG device timing (JT) with respect to the time data input signals (D) reaching the valid state (V) relative to the t_{JTG} clock reference (K) going to the high (H) state or setup time. Also, t_{JTDXKH} symbolizes JTAG timing (JT) with respect to the time data input signals (D) went invalid (X) relative to the t_{JTG} clock reference (K) going to the high (H) state. Note that, in general, the clock reference symbol representation is based on three letters representing the clock of a particular functional. For rise and fall times, the latter convention is used with the appropriate letter: R (rise) or F (fall).
3. $\overline{\text{TRST}}$ is an asynchronous level sensitive signal. The setup time is for test purposes only.
4. Non-JTAG signal input timing with respect to t_{TCLK}.
5. Non-JTAG signal output timing with respect to t_{TCLK}.
6. Guaranteed by design and characterization.

This figure provides the AC test load for TDO and the boundary-scan outputs of the device.

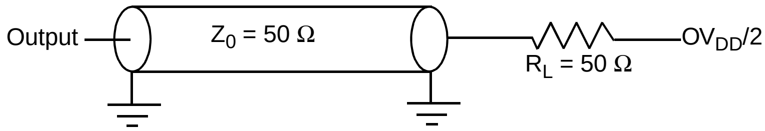

Figure 29. AC Test Load for the JTAG Interface

This figure provides the JTAG clock input timing diagram.

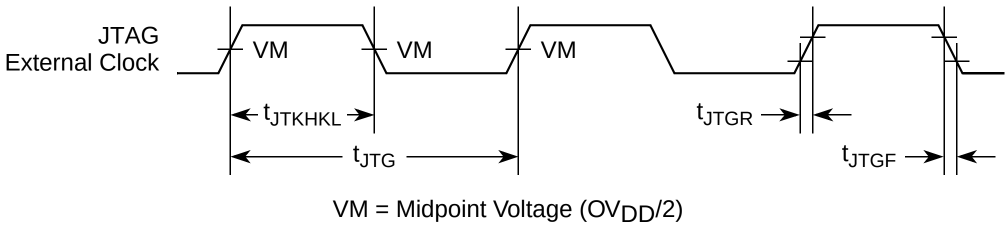

Figure 30. JTAG Clock Input Timing Diagram

This figure provides the $\overline{\text{TRST}}$ timing diagram.

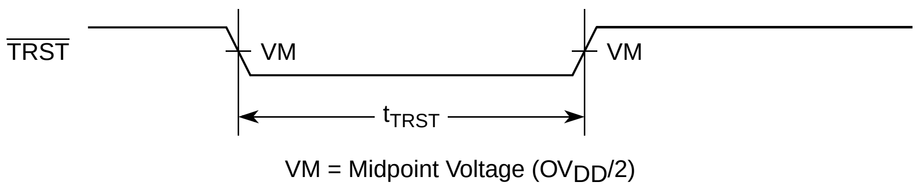

Figure 31. $\overline{\text{TRST}}$ Timing Diagram

This figure provides the boundary-scan timing diagram.

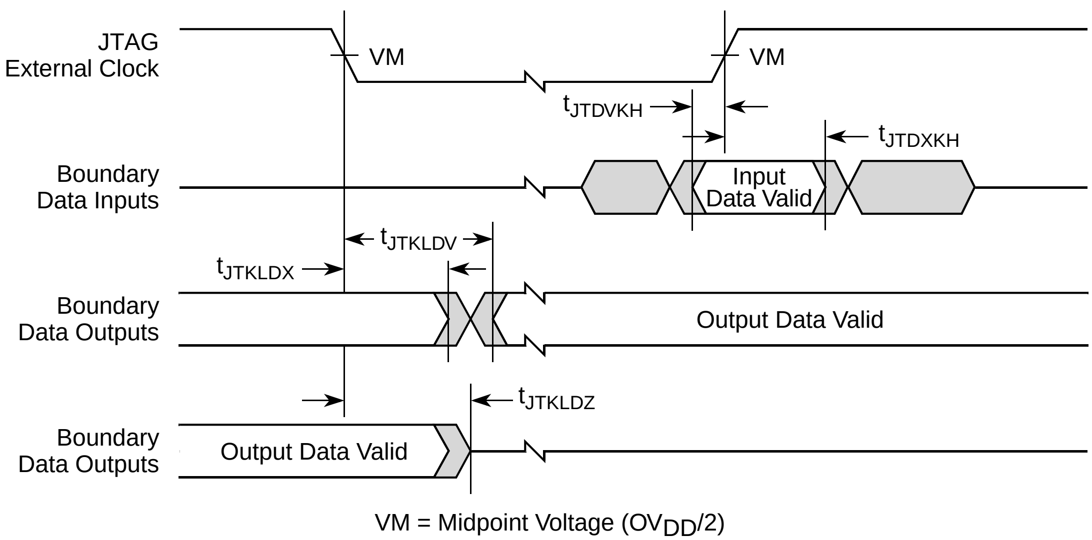

Figure 32. Boundary-Scan Timing Diagram

13.2 Timers AC Timing Specifications

This table provides the timer input and output AC timing specifications.

Table 50. Timers Input AC Timing Specifications[1]

Characteristic	Symbol[2]	Typ	Unit
Timers inputs—minimum pulse width	t_{TIWID}	20	ns

Notes:
1. Input specifications are measured from the 50% level of the signal to the 50% level of the rising edge of CLKIN. Timings are measured at the pin.
2. Timers inputs and outputs are asynchronous to any visible clock. Timers outputs should be synchronized before use by any external synchronous logic. Timers inputs are required to be valid for at least t_{TIWID} ns to ensure proper operation.

This figure provides the AC test load for the timers.

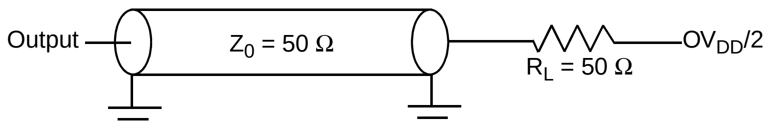

Figure 39. Timers AC Test Load

14 GPIO

This section describes the DC and AC electrical specifications for the GPIO of the MPC8360E/58E.

14.1 GPIO DC Electrical Characteristics

This table provides the DC electrical characteristics for the device GPIO.

Table 51. GPIO DC Electrical Characteristics

Characteristic	Symbol	Condition	Min	Max	Unit	Notes
Output high voltage	V_{OH}	I_{OH} = –6.0 mA	2.4	—	V	1
Output low voltage	V_{OL}	I_{OL} = 6.0 mA	—	0.5	V	1
Output low voltage	V_{OL}	I_{OL} = 3.2 mA	—	0.4	V	1
Input high voltage	V_{IH}	—	2.0	OV_{DD} + 0.3	V	1
Input low voltage	V_{IL}	—	–0.3	0.8	V	—
Input current	I_{IN}	0 V $\leq V_{IN} \leq OV_{DD}$	—	±10	μA	—

Note:
1. This specification applies when operating from 3.3-V supply.

This figure shows the UTOPIA timing with internal clock.

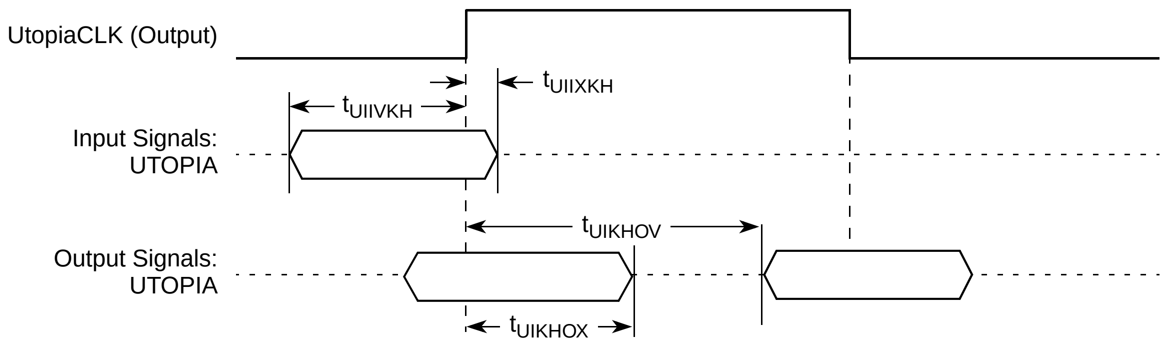

Figure 48. UTOPIA AC Timing (Internal Clock) Diagram

18 HDLC, BISYNC, Transparent, and Synchronous UART

This section describes the DC and AC electrical specifications for the high level data link control (HDLC), BISYNC, transparent, and synchronous UART protocols of the MPC8360E/58E.

18.1 HDLC, BISYNC, Transparent, and Synchronous UART DC Electrical Characteristics

This table provides the DC electrical characteristics for the device HDLC, BISYNC, transparent, and synchronous UART protocols.

Table 61. HDLC, BISYNC, Transparent, and Synchronous UART DC Electrical Characteristics

Characteristic	Symbol	Condition	Min	Max	Unit
Output high voltage	V_{OH}	I_{OH} = –2.0 mA	2.4	—	V
Output low voltage	V_{OL}	I_{OL} = 3.2 mA	—	0.5	V
Input high voltage	V_{IH}	—	2.0	OV_{DD} + 0.3	V
Input low voltage	V_{IL}	—	–0.3	0.8	V
Input current	I_{IN}	0 V ≤ V_{IN} ≤ OV_{DD}	—	±10	μA

18.2 HDLC, BISYNC, Transparent, and Synchronous UART AC Timing Specifications

These tables provide the input and output AC timing specifications for HDLC, BISYNC, transparent, and synchronous UART protocols.

Table 62. HDLC, BISYNC, and Transparent AC Timing Specifications[1]

Characteristic	Symbol[2]	Min	Max	Unit
Outputs—Internal clock delay	t_{HIKHOV}	0	11.2	ns
Outputs—External clock delay	t_{HEKHOV}	1	10.8	ns

clock. When the device is configured as a PCI agent device the CLKIN and the CFG_CLKIN_DIV signals should be tied to GND.

When the device is configured as a PCI host device (RCWH[PCIHOST] = 1) and PCI clock output is disabled (RCWH[PCICKDRV] = 0), clock distribution and balancing done externally on the board. Therefore, PCI_SYNC_IN is the primary input clock.

As shown in Figure 54 and Figure 55, the primary clock input (frequency) is multiplied by the QUICC Engine block phase-locked loop (PLL), the system PLL, and the clock unit to create the QUICC Engine clock (*ce_clk*), the coherent system bus clock (*csb_clk*), the internal DDRC1 controller clock (*ddr1_clk*), and the internal clock for the local bus interface unit and DDR2 memory controller (*lb_clk*).

The *csb_clk* frequency is derived from a complex set of factors that can be simplified into the following equation:

$$csb\_clk = \{PCI\_SYNC\_IN \times (1 + CFG\_CLKIN\_DIV)\} \times SPMF$$

In PCI host mode, PCI_SYNC_IN × (1 + CFG_CLKIN_DIV) is the CLKIN frequency; in PCI agent mode, CFG_CLKIN_DIV must be pulled down (low), so PCI_SYNC_IN × (1 + CFG_CLKIN_DIV) is the PCI_CLK frequency.

The *csb_clk* serves as the clock input to the e300 core. A second PLL inside the e300 core multiplies up the *csb_clk* frequency to create the internal clock for the e300 core (*core_clk*). The system and core PLL multipliers are selected by the SPMF and COREPLL fields in the reset configuration word low (RCWL) which is loaded at power-on reset or by one of the hard-coded reset options. See Chapter 4, "Reset, Clocking, and Initialization," in the *MPC8360E PowerQUICC II Pro Integrated Communications Processor Reference Manual* for more information on the clock subsystem.

The *ce_clk* frequency is determined by the QUICC Engine PLL multiplication factor (RCWL[CEPMF) and the QUICC Engine PLL division factor (RCWL[CEPDF]) according to the following equation:

$$ce\_clk = (\text{primary clock input} \times CEPMF) \div (1 + CEPDF)$$

The internal *ddr1_clk* frequency is determined by the following equation:

$$ddr1\_clk = csb\_clk \times (1 + RCWL[DDR1CM])$$

Note that the lb_clk clock frequency (for DDRC2) is determined by RCWL[LBCM]. The *internal ddr1_clk* frequency is not the external memory bus frequency; *ddr1_clk* passes through the DDRC1 clock divider (÷2) to create the differential DDRC1 memory bus clock outputs (MEMC1_MCK and $\overline{\text{MEMC1\_MCK}}$). However, the data rate is the same frequency as *ddr1_clk*.

The internal *lb_clk* frequency is determined by the following equation:

$$lb\_clk = csb\_clk \times (1 + RCWL[LBCM])$$

Note that *lb_clk* is not the external local bus or DDRC2 frequency; *lb_clk* passes through the a LB clock divider to create the external local bus clock outputs (LSYNC_OUT and LCLK[0:2]). The LB clock divider ratio is controlled by LCRR[CLKDIV].

Additionally, some of the internal units may be required to be shut off or operate at lower frequency than the *csb_clk* frequency. Those units have a default clock ratio that can be configured by a memory mapped register after the device comes out of reset. This table specifies which units have a configurable clock frequency.

Table 68. Configurable Clock Units

Unit	Default Frequency	Options
Security core	*csb_clk*/3	Off, *csb_clk*[1], *csb_clk*/2, *csb_clk*/3
PCI and DMA complex	csb_clk	Off, *csb_clk*

[1] With limitation, only for slow csb_clk rates, up to 166 MHz.

This table provides the operating frequencies for the TBGA package under recommended operating conditions (see Table 2). All frequency combinations shown in the table below may not be available. Maximum operating frequencies depend on the part

Table 74. QUICC Engine Block PLL Multiplication Factors (continued)

RCWL[CEPMF]	RCWL[CEPDF]	QUICC Engine PLL Multiplication Factor = RCWL[CEPMF]/ (1 + RCWL[CEPDF])
11101	0	× 29
11110	0	× 30
11111	0	× 31
00011	1	× 1.5
00101	1	× 2.5
00111	1	× 3.5
01001	1	× 4.5
01011	1	× 5.5
01101	1	× 6.5
01111	1	× 7.5
10001	1	× 8.5
10011	1	× 9.5
10101	1	× 10.5
10111	1	× 11.5
11001	1	× 12.5
11011	1	× 13.5
11101	1	× 14.5

Note:

1. Reserved modes are not listed.

The RCWL[CEVCOD] denotes the QUICC Engine Block PLL VCO internal frequency as shown in this table.

Table 75. QUICC Engine Block PLL VCO Divider

RCWL[CEVCOD]	VCO Divider
00	4
01	8
10	2
11	Reserved

NOTE

The VCO divider (RCWL[CEVCOD]) must be set properly so that the QUICC Engine block VCO frequency is in the range of 600–1400 MHz. The QUICC Engine block frequency is not restricted by the CSB and core frequencies. The CSB, core, and QUICC Engine block frequencies should be selected according to the performance requirements.

Table 77. Package Thermal Characteristics for the TBGA Package (continued)

Characteristic	Symbol	Value	Unit	Notes
Junction-to-package natural convection on top	ψ_{JT}	1	°C/W	6

Notes

1. Junction temperature is a function of die size, on-chip power dissipation, package thermal resistance, mounting site (board) temperature, ambient temperature, airflow, power dissipation of other components on the board, and board thermal resistance.
2. Per JEDEC JESD51-2 and SEMI G38-87 with the single layer board horizontal.
3. Per JEDEC JESD51-6 with the board horizontal. 1 m/sec is approximately equal to 200 linear feet per minute (LFM).
4. Thermal resistance between the die and the printed-circuit board per JEDEC JESD51-8. Board temperature is measured on the top surface of the board near the package.
5. Thermal resistance between the die and the case top surface as measured by the cold plate method (MIL SPEC-883 Method 1012.1).
6. Thermal characterization parameter indicating the temperature difference between package top and the junction temperature per JEDEC JESD51-2. When Greek letters are not available, the thermal characterization parameter is written as Psi-JT.

22.2 Thermal Management Information

For the following sections, $P_D = (V_{DD} \times I_{DD}) + P_{I/O}$ where $P_{I/O}$ is the power dissipation of the I/O drivers. See Table 6 for typical power dissipations values.

22.2.1 Estimation of Junction Temperature with Junction-to-Ambient Thermal Resistance

An estimation of the chip junction temperature, T_J, can be obtained from the equation:

$$T_J = T_A + (R_{\theta JA} \times P_D)$$

where:

T_J = junction temperature (°C)

T_A = ambient temperature for the package (°C)

$R_{\theta JA}$ = junction-to-ambient thermal resistance (°C/W)

P_D = power dissipation in the package (W)

The junction-to-ambient thermal resistance is an industry standard value that provides a quick and easy estimation of thermal performance. As a general statement, the value obtained on a single-layer board is appropriate for a tightly packed printed-circuit board. The value obtained on the board with the internal planes is usually appropriate if the board has low power dissipation and the components are well separated. Test cases have demonstrated that errors of a factor of two (in the quantity $T_J - T_A$) are possible.

22.2.2 Estimation of Junction Temperature with Junction-to-Board Thermal Resistance

The thermal performance of a device cannot be adequately predicted from the junction-to-ambient thermal resistance. The thermal performance of any component is strongly dependent on the power dissipation of surrounding components. Additionally, the ambient temperature varies widely within the application. For many natural convection and especially closed box applications, the board temperature at the perimeter (edge) of the package is approximately the same as the local air temperature near the device. Specifying the local ambient conditions explicitly as the board temperature provides a more precise description of the local ambient conditions that determine the temperature of the device. At a known board temperature, the junction temperature is estimated using the following equation:

Table 81. SVR Settings (continued)

Device	Package	SVR (Rev. 2.0)	SVR (Rev. 2.1)
MPC8358E	TBGA	0x804A_0020	0x804A_0021
MPC8358	TBGA	0x804B_0020	0x804B_0021

25 Document Revision History

This table provides a revision history for this document.

Table 82. Revision History

Rev. Number	Date	Substantive Change(s)
5	09/2011	• Section 2.2.1, "Power-Up Sequencing", added the current limitation "3A to 5A" for the excessive current. • Section 2.1.2, "Power Supply Voltage Specification, Updated the Characteristic for TBGA (MPC8358 & MPC8360 Device) with specific frequency for Core and PLL voltages. • Added table footnote 3 to Table 2. • Applied table footnotes 1 and 2 to Table 10. • Removed table footnotes from Table 19. • Applied table footnote 8 to the last row of Table 40. • Applied table footnotes 8 and 9 to Table 41. • Applied table footnotes 2and 3 to Table 45. • Removed table footnotes from Table 46. • Applied table footnote to last three rows of Table 65.
4	01/2011	• Updated references to the LCRR register throughout • Removed references to DDR DLL mode in Section 6.2.2, "DDR and DDR2 SDRAM Output AC Timing Specifications." • Changed "Junction-to-Case" to "Junction-to-Ambient" in Section 22.2.4, "Heat Sinks and Junction-to-Ambient Thermal Resistance," and Table 78, "Heat Sinks and Junction-to-Ambient Thermal Resistance of TBGA Package," titles.
