NXP USA Inc. - MPC8360ZUADDH Datasheet

Welcome to E-XFL.COM

Understanding Embedded - Microprocessors

Embedded microprocessors are specialized computing chips designed to perform specific tasks within an embedded system. Unlike general-purpose microprocessors found in personal computers, embedded microprocessors are tailored for dedicated functions within larger systems, offering optimized performance, efficiency, and reliability. These microprocessors are integral to the operation of countless electronic devices, providing the computational power necessary for controlling processes, handling data, and managing communications.

Applications of Embedded - Microprocessors

Embedded microprocessors are utilized across a broad spectrum of applications, making them indispensable in

Details	
Product Status	Obsolete
Core Processor	PowerPC e300
Number of Cores/Bus Width	1 Core, 32-Bit
Speed	266MHz
Co-Processors/DSP	Communications; QUICC Engine
RAM Controllers	DDR, DDR2
Graphics Acceleration	No
Display & Interface Controllers	-
Ethernet	10/100/1000Mbps (1)
SATA	-
USB	USB 1.x (1)
Voltage - I/O	1.8V, 2.5V, 3.3V
Operating Temperature	0°C ~ 105°C (TA)
Security Features	-
Package / Case	740-LBGA
Supplier Device Package	740-TBGA (37.5x37.5)
Purchase URL	https://www.e-xfl.com/product-detail/nxp-semiconductors/mpc8360zuaddh

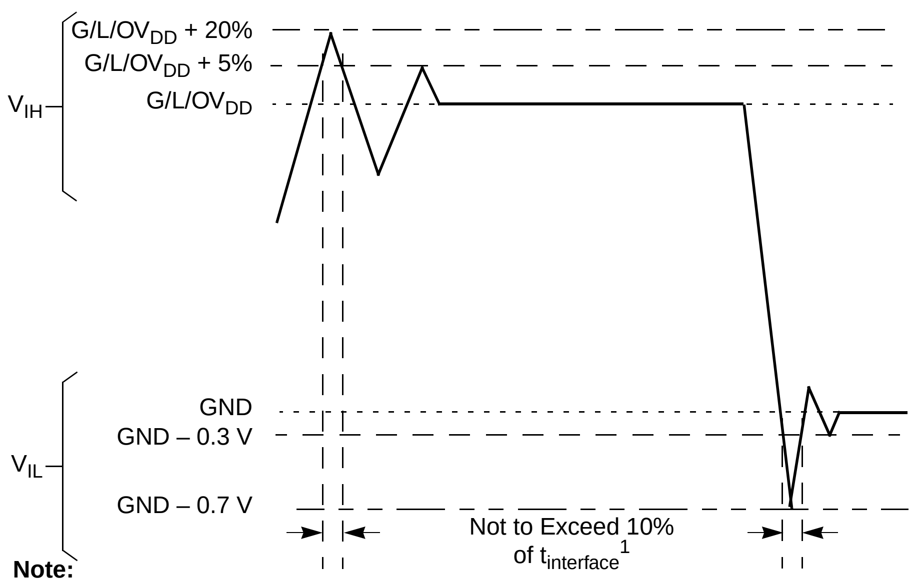
Table 2. Recommended Operating Conditions (continued)

Characteristic	Symbol	Recommended Value	Unit	Notes
PCI, local bus, DUART, system control and power management, I^2C, SPI, and JTAG I/O voltage	OV_{DD}	3.3 V ± 330 mV	V	—
Junction temperature	T_J	0 to 105 –40 to 105	°C	2

Notes:

1. GV_{DD}, LV_{DD}, OV_{DD}, AV_{DD}, and V_{DD} must track each other and must vary in the same direction—either in the positive or negative direction.
2. The operating conditions for junction temperature, T_J, on the 600/333/400 MHz and 500/333/500 MHz on rev. 2.0 silicon is 0° to 70 °C. Refer to Errata General9 in *Chip Errata for the MPC8360E, Rev. 1*.
3. For more information on Part Numbering, refer to Table 80.

This figure shows the undershoot and overshoot voltages at the interfaces of the device.



Note:

1. Note that $t_{interface}$ refers to the clock period associated with the bus clock interface.

Figure 3. Overshoot/Undershoot Voltage for $GV_{DD}/OV_{DD}/LV_{DD}$

5.2 RESET AC Electrical Characteristics

This section describes the AC electrical specifications for the reset initialization timing requirements of the device. This table provides the reset initialization AC timing specifications for the DDR SDRAM component(s).

Table 11. RESET Initialization Timing Specifications

Parameter/Condition	Min	Max	Unit	Notes
Required assertion time of HRESET or SRESET (input) to activate reset flow	32	—	$t_{PCI\_SYNC\_IN}$	1
Required assertion time of PORESET with stable clock applied to CLKIN when the device is in PCI host mode	32	—	t_{CLKIN}	2
Required assertion time of PORESET with stable clock applied to PCI_SYNC_IN when the device is in PCI agent mode	32	—	$t_{PCI\_SYNC\_IN}$	1
HRESET/SRESET assertion (output)	512	—	$t_{PCI\_SYNC\_IN}$	1
HRESET negation to SRESET negation (output)	16	—	$t_{PCI\_SYNC\_IN}$	1
Input setup time for POR config signals (CFG_RESET_SOURCE[0:2] and CFG_CLKIN_DIV) with respect to negation of PORESET when the device is in PCI host mode	4	—	t_{CLKIN}	2
Input setup time for POR config signals (CFG_RESET_SOURCE[0:2] and CFG_CLKIN_DIV) with respect to negation of PORESET when the device is in PCI agent mode	4	—	$t_{PCI\_SYNC\_IN}$	1
Input hold time for POR config signals with respect to negation of HRESET	0	—	ns	—
Time for the device to turn off POR config signals with respect to the assertion of HRESET	—	4	ns	3
Time for the device to turn on POR config signals with respect to the negation of HRESET	1	—	$t_{PCI\_SYNC\_IN}$	1, 3

Notes:
1. $t_{PCI\_SYNC\_IN}$ is the clock period of the input clock applied to PCI_SYNC_IN. When the device is In PCI host mode the primary clock is applied to the CLKIN input, and PCI_SYNC_IN period depends on the value of CFG_CLKIN_DIV. Refer *MPC8360E PowerQUICC II Pro Integrated Communications Processor Reference Manual* for more details.
2. t_{CLKIN} is the clock period of the input clock applied to CLKIN. It is only valid when the device is in PCI host mode. Refer *MPC8360E PowerQUICC II Pro Integrated Communications Processor Reference Manual* for more details.
3. POR config signals consists of CFG_RESET_SOURCE[0:2] and CFG_CLKIN_DIV.

This table provides the PLL and DLL lock times.

Table 12. PLL and DLL Lock Times

Parameter/Condition	Min	Max	Unit	Notes
PLL lock times	—	100	µs	—
DLL lock times	7680	122,880	csb_clk cycles	1, 2

Notes:
1. DLL lock times are a function of the ratio between the output clock and the coherency system bus clock (csb_clk). A 2:1 ratio results in the minimum and an 8:1 ratio results in the maximum.
2. The csb_clk is determined by the CLKIN and system PLL ratio. See Section 21, “Clocking,” for more information.

5.3 QUICC Engine Block Operating Frequency Limitations

This section specify the limits of the AC electrical characteristics for the operation of the QUICC Engine block's communication interfaces.

NOTE

The settings listed below are required for correct hardware interface operation. Each protocol by itself requires a minimal QUICC Engine block operating frequency setting for meeting the performance target. Because the performance is a complex function of all the QUICC Engine block settings, the user should make use of the QUICC Engine block performance utility tool provided by Freescale to validate their system.

This table lists the maximal QUICC Engine block I/O frequencies and the minimal QUICC Engine block core frequency for each interface.

Table 13. QUICC Engine Block Operating Frequency Limitations

Interface	Interface Operating Frequency (MHz)	Max Interface Bit Rate (Mbps)	Min QUICC Engine Operating Frequency[1] (MHz)	Notes
Ethernet Management: MDC/MDIO	10 (max)	10	20	—
MII	25 (typ)	100	50	—
RMII	50 (typ)	100	50	—
GMII/RGMII/TBI/RTBI	125 (typ)	1000	250	—
SPI (master/slave)	10 (max)	10	20	—
UCC through TDM	50 (max)	70	8 × F	2
MCC	25 (max)	16.67	16 × F	2, 4
UTOPIA L2	50 (max)	800	2 × F	2
POS-PHY L2	50 (max)	800	2 × F	2
HDLC bus	10 (max)	10	20	—
HDLC/transparent	50 (max)	50	8/3 × F	2, 3
UART/async HDLC	3.68 (max internal ref clock)	115 (Kbps)	20	—
BISYNC	2 (max)	2	20	—
USB	48 (ref clock)	12	96	—

Notes:

1. The QUICC Engine module needs to run at a frequency higher than or equal to what is listed in this table.
2. 'F' is the actual interface operating frequency.\
3. The bit rate limit is independent of the data bus width (that is, the same for serial, nibble, or octal interfaces).
4. TDM in high-speed mode for serial data interface.

6 DDR and DDR2 SDRAM

This section describes the DC and AC electrical specifications for the DDR and DDR2 SDRAM interface of the MPC8360E/58E.

8.2.1.2 GMII Receive AC Timing Specifications

This table provides the GMII receive AC timing specifications.

Table 28. GMII Receive AC Timing Specifications

At recommended operating conditions with LV_{DD}/OV_{DD} of 3.3 V ± 10%.

Parameter/Condition	Symbol[1]	Min	Typ	Max	Unit	Notes
RX_CLK clock period	t_{GRX}	—	8.0	—	ns	—
RX_CLK duty cycle	t_{GRXH}/t_{GRX}	40	—	60	%	—
RXD[7:0], RX_DV, RX_ER setup time to RX_CLK	t_{GRDVKH}	2.0	—	—	ns	—
RXD[7:0], RX_DV, RX_ER hold time to RX_CLK	t_{GRDXKH}	0.2	—	—	ns	2
RX_CLK clock rise time, (20% to 80%)	t_{GRXR}	—	—	1.0	ns	—
RX_CLK clock fall time, (80% to 20%)	t_{GRXF}	—	—	1.0	ns	—

Notes:
1. The symbols used for timing specifications follow the pattern of $t_{(\text{first two letters of functional block})(\text{signal})(\text{state})(\text{reference})(\text{state})}$ for inputs and $t_{(\text{first two letters of functional block})(\text{reference})(\text{state})(\text{signal})(\text{state})}$ for outputs. For example, t_{GRDVKH} symbolizes GMII receive timing (GR) with respect to the time data input signals (D) reaching the valid state (V) relative to the t_{RX} clock reference (K) going to the high state (H) or setup time. Also, t_{GRDXKL} symbolizes GMII receive timing (GR) with respect to the time data input signals (D) went invalid (X) relative to the t_{GRX} clock reference (K) going to the low (L) state or hold time. Note that, in general, the clock reference symbol representation is based on three letters representing the clock of a particular functional. For example, the subscript of t_{GRX} represents the GMII (G) receive (RX) clock. For rise and fall times, the latter convention is used with the appropriate letter: R (rise) or F (fall).
2. In rev. 2.0 silicon, due to errata, t_{GRDXKH} minimum is 0.5 which is not compliant with the standard. Refer to Errata *QE_ENET18* in *Chip Errata for the MPC8360E, Rev. 1*.

This figure shows the GMII receive AC timing diagram.

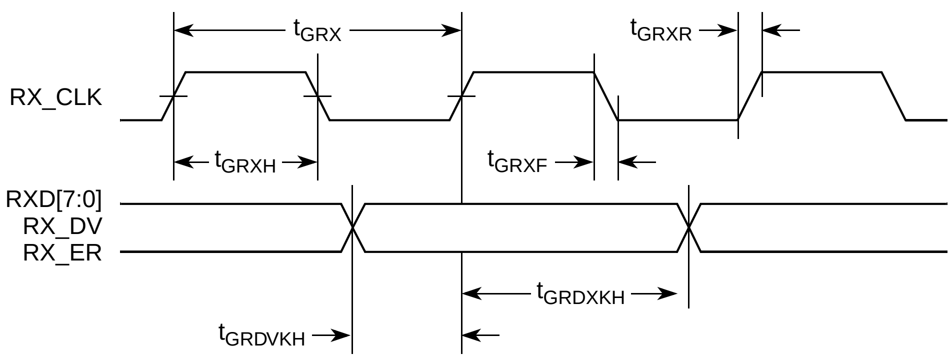


Figure 11. GMII Receive AC Timing Diagram

8.2.2 MII AC Timing Specifications

This section describes the MII transmit and receive AC timing specifications.

8.2.2.1 MII Transmit AC Timing Specifications

This table provides the MII transmit AC timing specifications.

Table 29. MII Transmit AC Timing Specifications

At recommended operating conditions with LV_{DD}/OV_{DD} of 3.3 V ± 10%.

Parameter/Condition	Symbol[1]	Min	Typ	Max	Unit
TX_CLK clock period 10 Mbps	t_{MTX}	—	400	—	ns
TX_CLK clock period 100 Mbps	t_{MTX}	—	40	—	ns
TX_CLK duty cycle	t_{MTXH}/t_{MTX}	35	—	65	%
TX_CLK to MII data TXD[3:0], TX_ER, TX_EN delay	t_{MTKHDX} t_{MTKHDV}	1 —	5	— 15	ns
TX_CLK data clock rise time, (20% to 80%)	t_{MTXR}	1.0	—	4.0	ns
TX_CLK data clock fall time, (80% to 20%)	t_{MTXF}	1.0	—	4.0	ns

Note:

1. The symbols used for timing specifications follow the pattern of $t_{\text{(first two letters of functional block)(signal)(state)(reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, t_{MTKHDX} symbolizes MII transmit timing (MT) for the time t_{MTX} clock reference (K) going high (H) until data outputs (D) are invalid (X). Note that, in general, the clock reference symbol representation is based on two to three letters representing the clock of a particular functional. For example, the subscript of t_{MTX} represents the MII(M) transmit (TX) clock. For rise and fall times, the latter convention is used with the appropriate letter: R (rise) or F (fall).

This figure shows the MII transmit AC timing diagram.

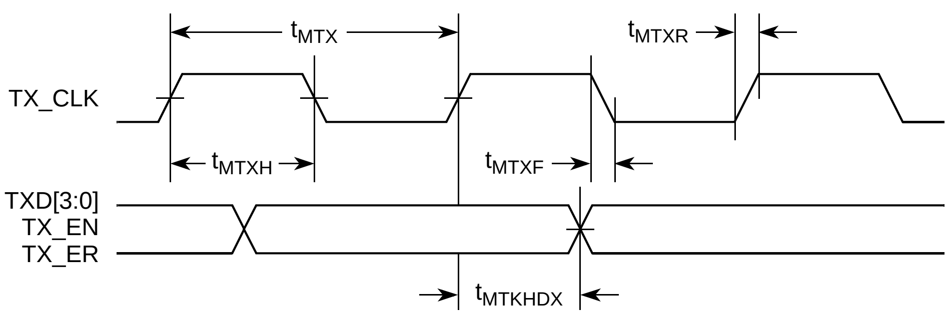

Figure 12. MII Transmit AC Timing Diagram

8.2.2.2 MII Receive AC Timing Specifications

This table provides the MII receive AC timing specifications.

Table 30. MII Receive AC Timing Specifications

At recommended operating conditions with LV_{DD}/OV_{DD} of 3.3 V ± 10%.

Parameter/Condition	Symbol[1]	Min	Typ	Max	Unit
RX_CLK clock period 10 Mbps	t_{MRX}	—	400	—	ns
RX_CLK clock period 100 Mbps	t_{MRX}	—	40	—	ns
RX_CLK duty cycle	t_{MRXH}/t_{MRX}	35	—	65	%
RXD[3:0], RX_DV, RX_ER setup time to RX_CLK	t_{MRDVKH}	10.0	—	—	ns
RXD[3:0], RX_DV, RX_ER hold time to RX_CLK	t_{MRDXKH}	10.0	—	—	ns
RX_CLK clock rise time, (20% to 80%)	t_{MRXR}	1.0	—	4.0	ns
RX_CLK clock fall time, (80% to 20%)	t_{MRXF}	1.0	—	4.0	ns

Note:

1. The symbols used for timing specifications follow the pattern of $t_{(first\ two\ letters\ of\ functional\ block)(signal)(state)(reference)(state)}$ for inputs and $t_{(first\ two\ letters\ of\ functional\ block)(reference)(state)(signal)(state)}$ for outputs. For example, t_{MRDVKH} symbolizes MII receive timing (MR) with respect to the time data input signals (D) reach the valid state (V) relative to the t_{MRX} clock reference (K) going to the high (H) state or setup time. Also, t_{MRDXKL} symbolizes MII receive timing (GR) with respect to the time data input signals (D) went invalid (X) relative to the t_{MRX} clock reference (K) going to the low (L) state or hold time. Note that, in general, the clock reference symbol representation is based on three letters representing the clock of a particular functional. For example, the subscript of t_{MRX} represents the MII (M) receive (RX) clock. For rise and fall times, the latter convention is used with the appropriate letter: R (rise) or F (fall).

This figure provides the AC test load.

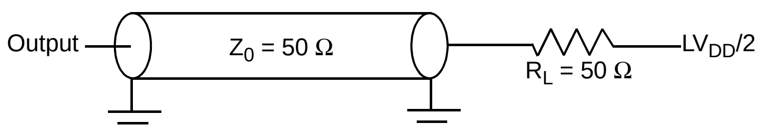

Figure 13. AC Test Load

This figure shows the MII receive AC timing diagram.

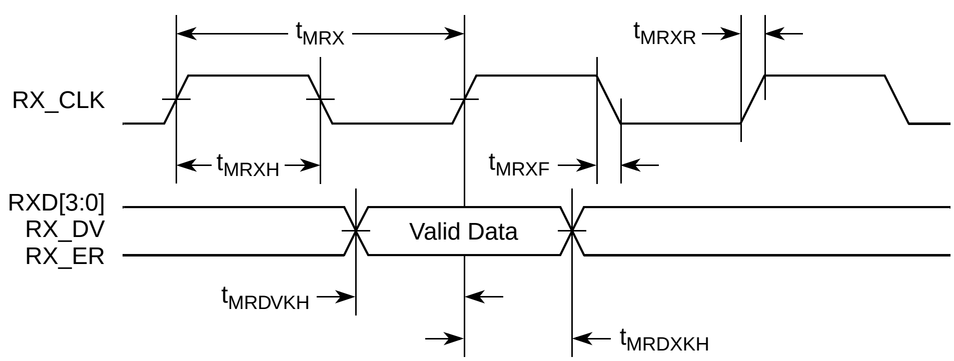

Figure 14. MII Receive AC Timing Diagram

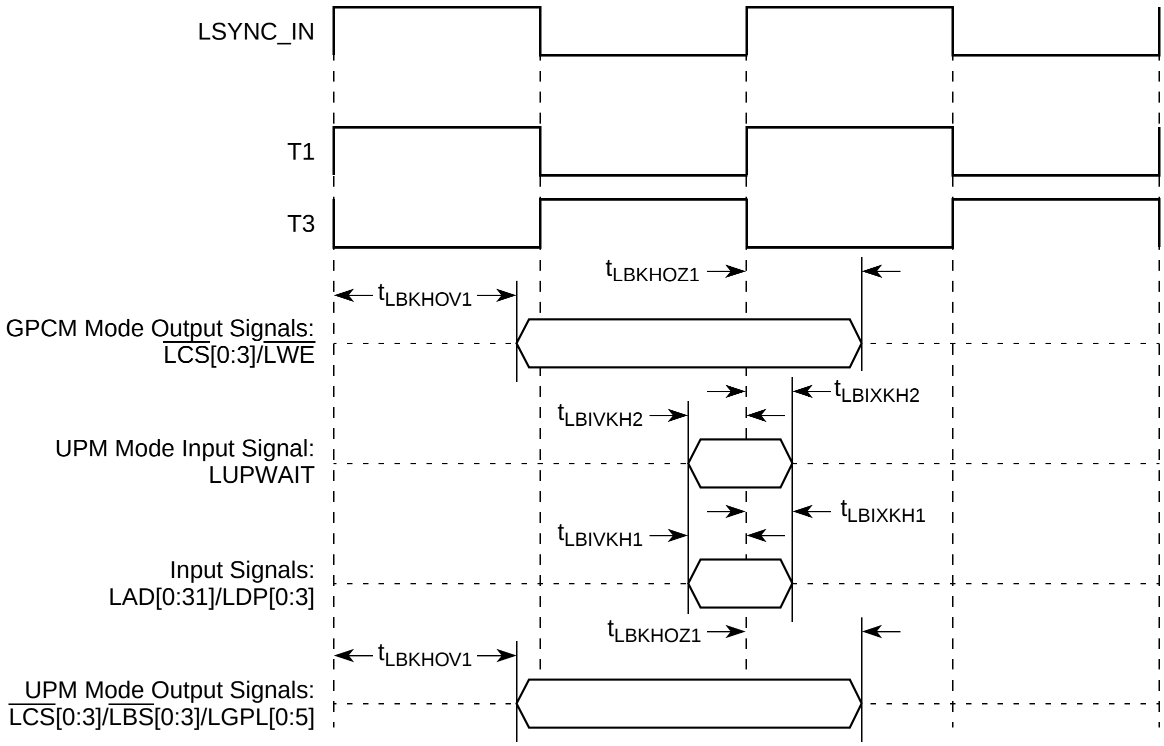

Figure 25. Local Bus Signals, GPCM/UPM Signals for LCRR[CLKDIV] = 2 (DLL Enabled)

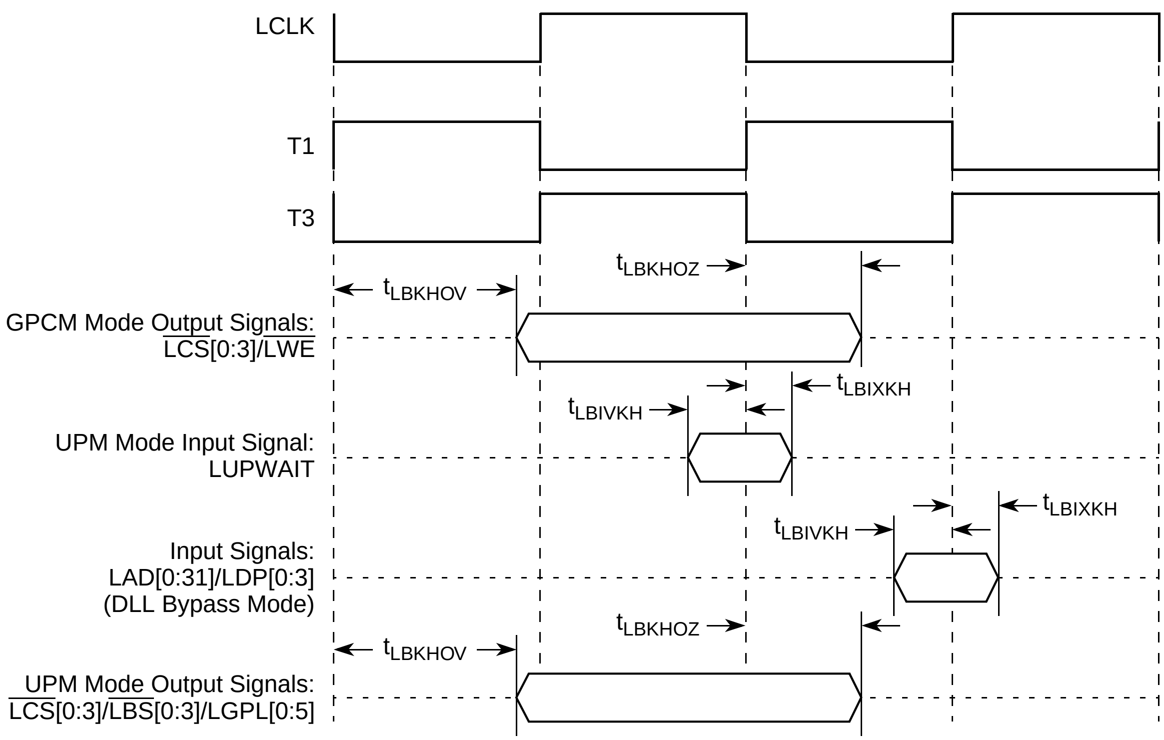

Figure 26. Local Bus Signals, GPCM/UPM Signals for LCRR[CLKDIV] = 2 (DLL Bypass Mode)

13.2 Timers AC Timing Specifications

This table provides the timer input and output AC timing specifications.

Table 50. Timers Input AC Timing Specifications[1]

Characteristic	Symbol[2]	Typ	Unit
Timers inputs—minimum pulse width	t_{TIWID}	20	ns

Notes:
1. Input specifications are measured from the 50% level of the signal to the 50% level of the rising edge of CLKIN. Timings are measured at the pin.
2. Timers inputs and outputs are asynchronous to any visible clock. Timers outputs should be synchronized before use by any external synchronous logic. Timers inputs are required to be valid for at least t_{TIWID} ns to ensure proper operation.

This figure provides the AC test load for the timers.

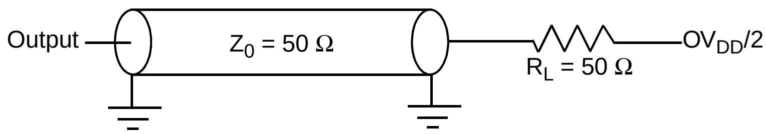

Figure 39. Timers AC Test Load

14 GPIO

This section describes the DC and AC electrical specifications for the GPIO of the MPC8360E/58E.

14.1 GPIO DC Electrical Characteristics

This table provides the DC electrical characteristics for the device GPIO.

Table 51. GPIO DC Electrical Characteristics

Characteristic	Symbol	Condition	Min	Max	Unit	Notes
Output high voltage	V_{OH}	I_{OH} = –6.0 mA	2.4	—	V	1
Output low voltage	V_{OL}	I_{OL} = 6.0 mA	—	0.5	V	1
Output low voltage	V_{OL}	I_{OL} = 3.2 mA	—	0.4	V	1
Input high voltage	V_{IH}	—	2.0	OV_{DD} + 0.3	V	1
Input low voltage	V_{IL}	—	–0.3	0.8	V	—
Input current	I_{IN}	0 V $\le V_{IN} \le OV_{DD}$	—	±10	μA	—

Note:
1. This specification applies when operating from 3.3-V supply.

Table 56. SPI AC Timing Specifications[1]

Characteristic	Symbol[2]	Min	Max	Unit
SPI inputs—Slave mode (external clock) input hold time	t_{NEIXKH}	2	—	ns

Notes:
1. Output specifications are measured from the 50% level of the rising edge of CLKIN to the 50% level of the signal. Timings are measured at the pin.
2. The symbols used for timing specifications follow the pattern of $t_{(first\ two\ letters\ of\ functional\ block)(signal)(state)(reference)(state)}$ for inputs and $t_{(first\ two\ letters\ of\ functional\ block)(reference)(state)(signal)(state)}$ for outputs. For example, t_{NIKHOV} symbolizes the NMSI outputs internal timing (NI) for the time t_{SPI} memory clock reference (K) goes from the high state (H) until outputs (O) are valid (V).

This figure provides the AC test load for the SPI.

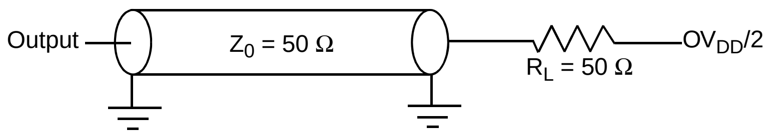

Figure 41. SPI AC Test Load

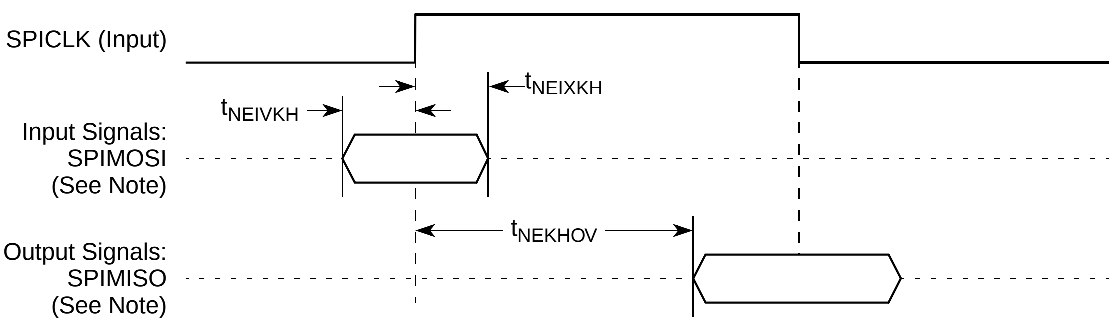
These figures represent the AC timing from Table 56. Note that although the specifications generally reference the rising edge of the clock, these AC timing diagrams also apply when the falling edge is the active edge.

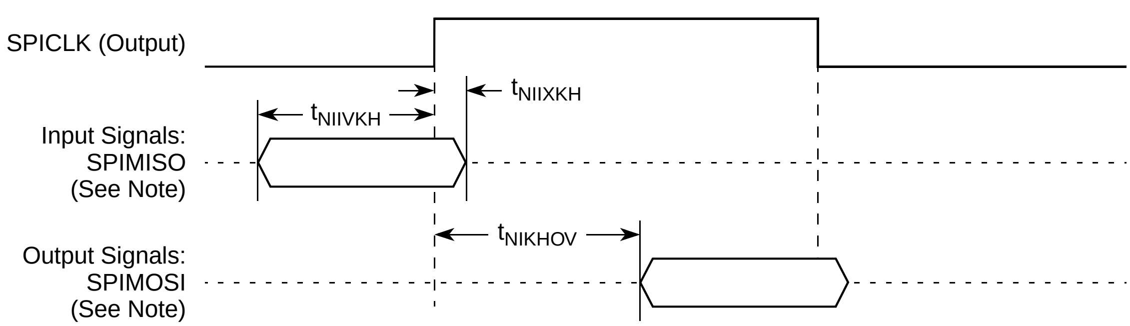
This figure shows the SPI timing in slave mode (external clock).



Note: The clock edge is selectable on SPI.

Figure 42. SPI AC Timing in Slave Mode (External Clock) Diagram

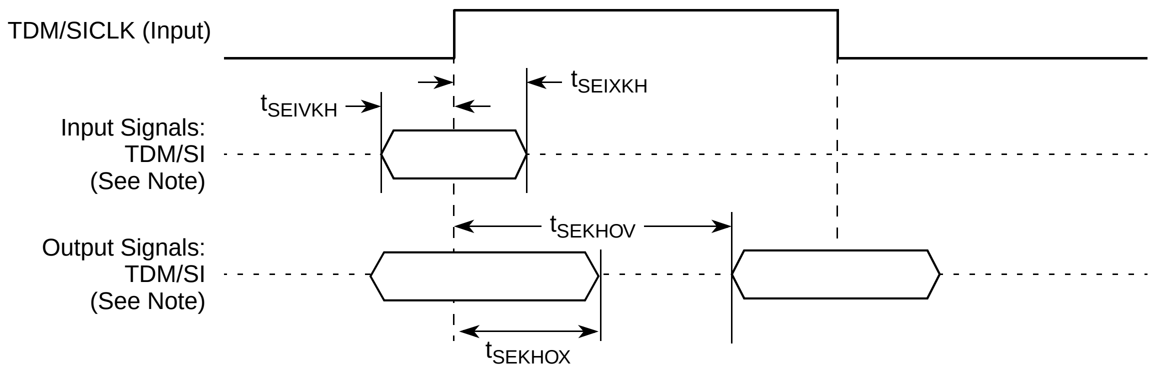
This figure shows the SPI timing in Master mode (internal clock).



Note: The clock edge is selectable on SPI.

Figure 43. SPI AC Timing in Master Mode (Internal Clock) Diagram

This figure shows the TDM/SI timing with external clock.



Note: The clock edge is selectable on TDM/SI

Figure 45. TDM/SI AC Timing (External Clock) Diagram

17.3 UTOPIA/POS

This section describes the DC and AC electrical specifications for the UTOPIA/POS of the MPC8360E/58E.

17.4 UTOPIA/POS DC Electrical Characteristics

This table provides the DC electrical characteristics for the device UTOPIA.

Table 59. UTOPIA DC Electrical Characteristics

Characteristic	Symbol	Condition	Min	Max	Unit
Output high voltage	V_{OH}	I_{OH} = –8.0 mA	2.4	—	V
Output low voltage	V_{OL}	I_{OL} = 8.0 mA	—	0.5	V
Input high voltage	V_{IH}	—	2.0	OV_{DD} + 0.3	V
Input low voltage	V_{IL}	—	–0.3	0.8	V
Input current	I_{IN}	0 V ≤V_{IN} ≤OV_{DD}	—	±10	μA

17.5 UTOPIA/POS AC Timing Specifications

This table provides the UTOPIA input and output AC timing specifications.

Table 60. UTOPIA AC Timing Specifications[1]

Characteristic	Symbol[2]	Min	Max	Unit	Notes
UTOPIA outputs—Internal clock delay	t_{UIKHOV}	0	11.5	ns	—
UTOPIA outputs—External clock delay	t_{UEKHOV}	1	11.6	ns	—
UTOPIA outputs—Internal clock high impedance	t_{UIKHOX}	0	8.0	ns	—
UTOPIA outputs—External clock high impedance	t_{UEKHOX}	1	10.0	ns	—
UTOPIA inputs—Internal clock input setup time	t_{UIIVKH}	6	—	ns	—
UTOPIA inputs—External clock input setup time	t_{UEIVKH}	4	—	ns	3

Table 62. HDLC, BISYNC, and Transparent AC Timing Specifications[1] (continued)

Characteristic	Symbol[2]	Min	Max	Unit
Outputs—Internal clock high impedance	t_{HIKHOX}	-0.5	5.5	ns
Outputs—External clock high impedance	t_{HEKHOX}	1	8	ns
Inputs—Internal clock input setup time	t_{HIIVKH}	8.5	—	ns
Inputs—External clock input setup time	t_{HEIVKH}	4	—	ns
Inputs—Internal clock input hold time	t_{HIIXKH}	1.4	—	ns
Inputs—External clock input hold time	t_{HEIXKH}	1	—	ns

Notes:
1. Output specifications are measured from the 50% level of the rising edge of CLKIN to the 50% level of the signal. Timings are measured at the pin.
2. The symbols used for timing specifications follow the pattern of $t_{\text{(first two letters of functional block)(signal)(state)(reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, t_{HIKHOX} symbolizes the outputs internal timing (HI) for the time t_{serial} memory clock reference (K) goes from the high state (H) until outputs (O) are invalid (X).

Table 63. Synchronous UART AC Timing Specifications[1]

Characteristic	Symbol[2]	Min	Max	Unit
Outputs—Internal clock delay	$t_{UAIKHOV}$	0	11.3	ns
Outputs—External clock delay	$t_{UAEKHOV}$	1	14	ns
Outputs—Internal clock high impedance	$t_{UAIKHOX}$	0	11	ns
Outputs—External clock high impedance	$t_{UAEKHOX}$	1	14	ns
Inputs—Internal clock input setup time	$t_{UAIIVKH}$	6	—	ns
Inputs—External clock input setup time	$t_{UAEIVKH}$	8	—	ns
Inputs—Internal clock input hold time	$t_{UAIIXKH}$	1	—	ns
Inputs—External clock input hold time	$t_{UAEIXKH}$	1	—	ns

Notes:
1. Output specifications are measured from the 50% level of the rising edge of CLKIN to the 50% level of the signal. Timings are measured at the pin.
2. The symbols used for timing specifications follow the pattern of $t_{\text{(first two letters of functional block)(signal)(state)(reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, t_{HIKHOX} symbolizes the outputs internal timing (HI) for the time t_{serial} memory clock reference (K) goes from the high state (H) until outputs (O) are invalid (X).

This figure provides the AC test load.

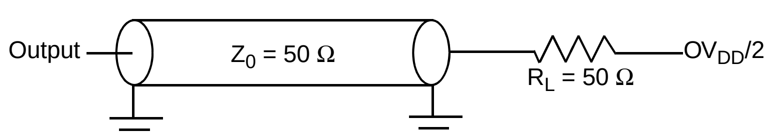


Figure 49. AC Test Load

18.3 AC Test Load

These figures represent the AC timing from Table 62 and Table 63. Note that although the specifications generally reference the rising edge of the clock, these AC timing diagrams also apply when the falling edge is the active edge.

This figure shows the timing with external clock.

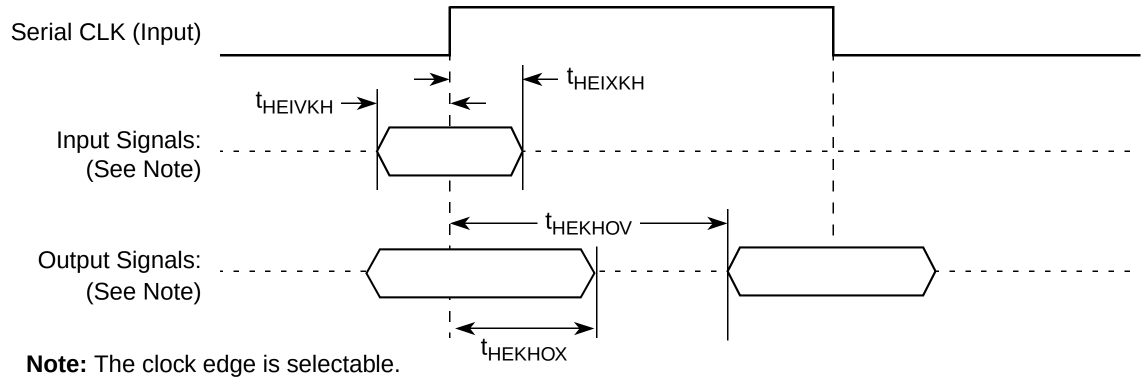

Figure 50. AC Timing (External Clock) Diagram

This figure shows the timing with internal clock.

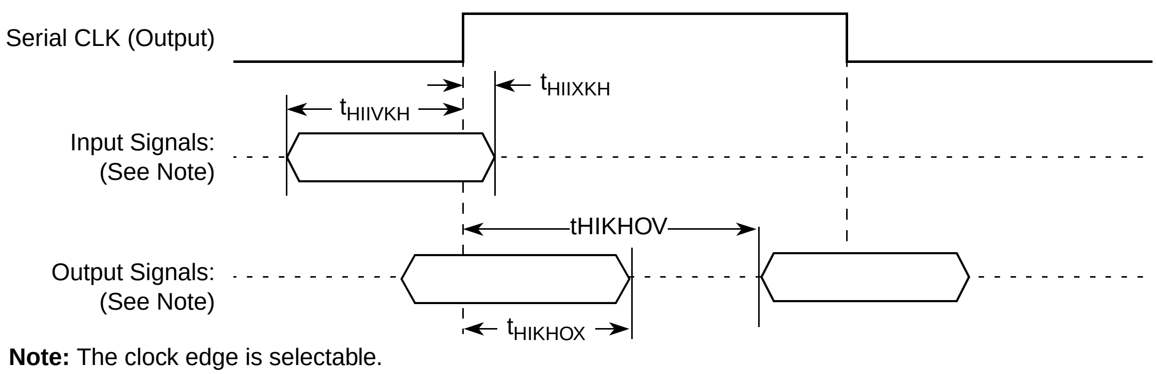

Figure 51. AC Timing (Internal Clock) Diagram

19 USB

This section provides the AC and DC electrical specifications for the USB interface of the MPC8360E/58E.

19.1 USB DC Electrical Characteristics

This table provides the DC electrical characteristics for the USB interface.

Table 64. USB DC Electrical Characteristics

Parameter	Symbol	Min	Max	Unit
High-level input voltage	V_{IH}	2	OV_{DD} + 0.3	V
Low-level input voltage	V_{IL}	–0.3	0.8	V
High-level output voltage, I_{OH} = –100 µA	V_{OH}	OV_{DD} – 0.4	—	V
Low-level output voltage, I_{OL} = 100 µA	V_{OL}	—	0.2	V
Input current	I_{IN}	—	±10	µA

19.2 USB AC Electrical Specifications

This table describes the general timing parameters of the USB interface of the device.

Table 65. USB General Timing Parameters

Parameter	Symbol[1]	Min	Max	Unit	Notes	Note
USB clock cycle time	t_{USCK}	20.83	—	ns	Full speed 48 MHz	—
USB clock cycle time	t_{USCK}	166.67	—	ns	Low speed 6 MHz	—
Skew between TXP and TXN	t_{USTSPN}	—	5	ns	—	2
Skew among RXP, RXN, and RXD	$t_{USRSPND}$	—	10	ns	Full speed transitions	2
Skew among RXP, RXN, and RXD	t_{USRPND}	—	100	ns	Low speed transitions	2

Notes:
1. The symbols used for timing specifications follow the pattern of $t_{\text{(first two letters of functional block)(state)(signal)}}$ for receive signals and $t_{\text{(first two letters of functional block)(state)(signal)}}$ for transmit signals. For example, $t_{USRSPND}$ symbolizes USB timing (US) for the USB receive signals skew (RS) among RXP, RXN, and RXD (PND). Also, t_{USTSPN} symbolizes USB timing (US) for the USB transmit signals skew (TS) between TXP and TXN (PN).
2. Skew measurements are done at OV_{DD}/2 of the rising or falling edge of the signals.

This figure provide the AC test load for the USB.

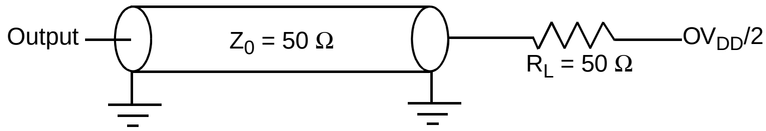

Figure 52. USB AC Test Load

Table 66. MPC8360E TBGA Pinout Listing (continued)

Signal	Package Pin Number	Pin Type	Power Supply	Notes
No Connect				
NC	AM20, AU19	—	—	—

Notes:

1. This pin is an open drain signal. A weak pull-up resistor (1 kΩ) should be placed on this pin to OV_{DD}
2. This pin is an open drain signal. A weak pull-up resistor (2–10 kΩ) should be placed on this pin to OV_{DD}.
3. This output is actively driven during reset rather than being three-stated during reset.
4. These JTAG pins have weak internal pull-up P-FETs that are always enabled.
5. This pin should have a weak pull up if the chip is in PCI host mode. Follow PCI specifications recommendation.
6. These are On Die Termination pins, used to control DDR2 memories internal termination resistance.
7. This pin must always be tied to GND.
8. This pin must always be left not connected.
9. Refer to *MPC8360E PowerQUICC II Pro Integrated Communications Processor Reference Manual* section on “RGMII Pins,” for information about the two UCC2 Ethernet interface options.
10. It is recommended that MDIC0 be tied to GND using an 18.2 Ω resistor and MDIC1 be tied to DDR power using an 18.2 Ω resistor for DDR2.

This table shows the pin list of the MPC8358E TBGA package.

Table 67. MPC8358E TBGA Pinout Listing

Signal	Package Pin Number	Pin Type	Power Supply	Notes

This figure shows the internal distribution of clocks within the MPC8358E.

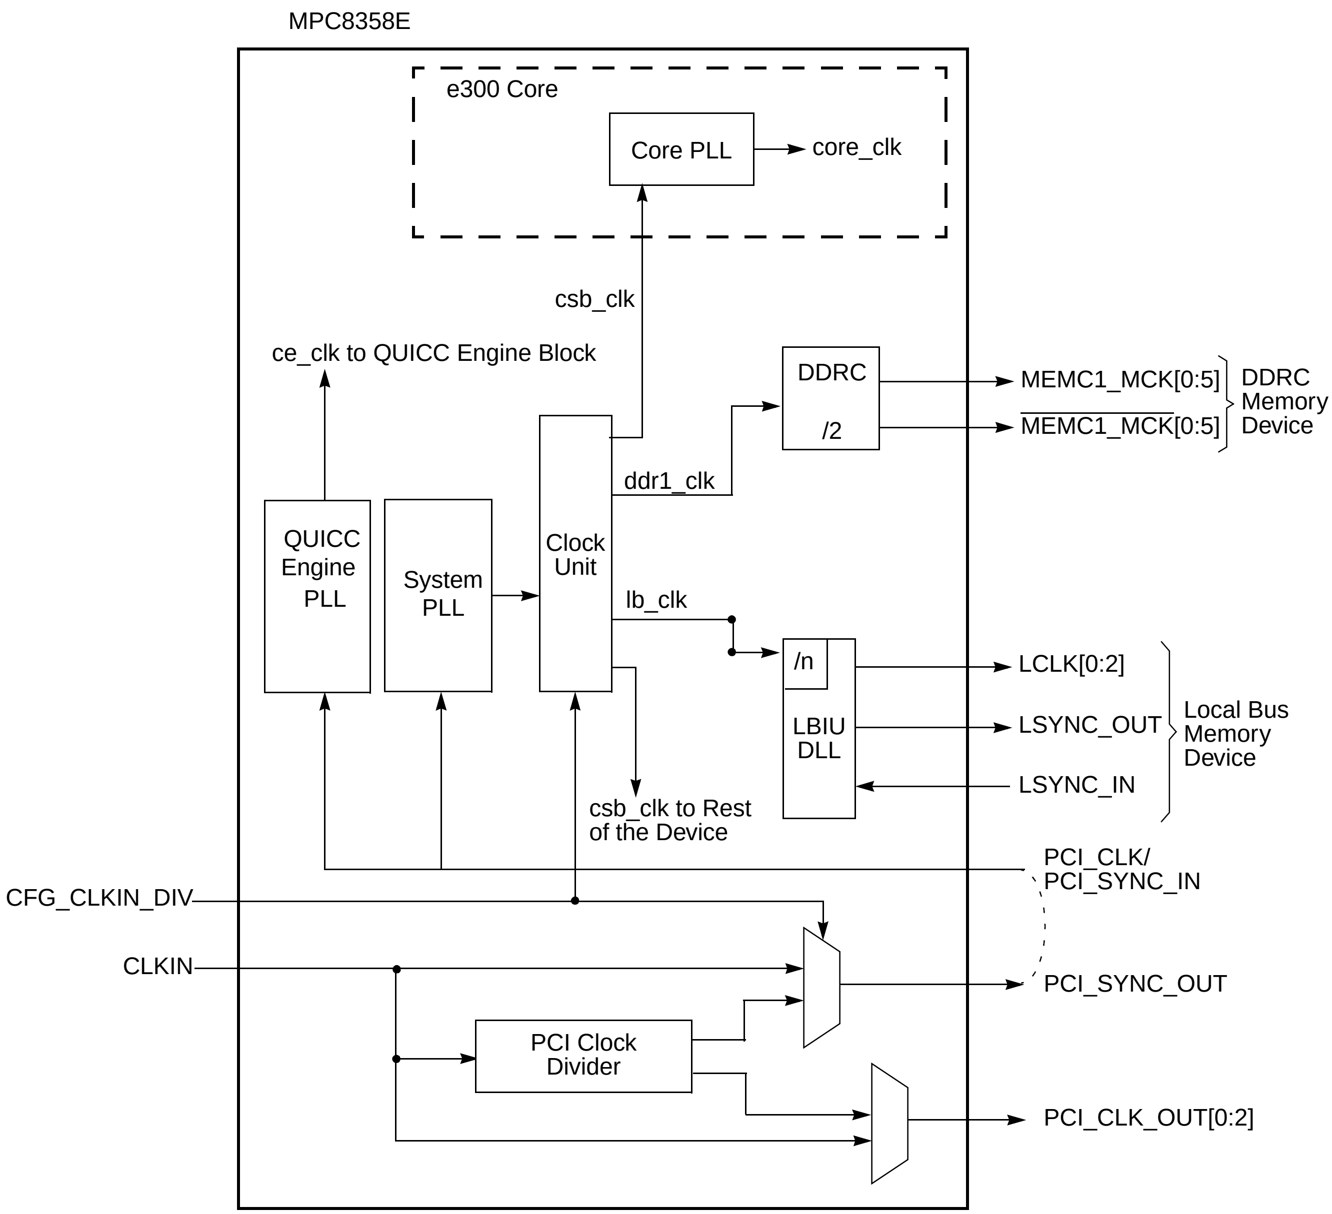

Figure 55. MPC8358E Clock Subsystem

The primary clock source for the device can be one of two inputs, CLKIN or PCI_CLK, depending on whether the device is configured in PCI host or PCI agent mode. Note that in PCI host mode, the primary clock input also depends on whether PCI clock outputs are selected with RCWH[PCICKDRV]. When the device is configured as a PCI host device (RCWH[PCIHOST] = 1) and PCI clock output is selected (RCWH[PCICKDRV] = 1), CLKIN is its primary input clock. CLKIN feeds the PCI clock divider (÷2) and the multiplexors for PCI_SYNC_OUT and PCI_CLK_OUT. The CFG_CLKIN_DIV configuration input selects whether CLKIN or CLKIN/2 is driven out on the PCI_SYNC_OUT signal. The OCCR[PCIOEN*n*] parameters enable the PCI_CLK_OUT*n*, respectively.

PCI_SYNC_OUT is connected externally to PCI_SYNC_IN to allow the internal clock subystem to synchronize to the system PCI clocks. PCI_SYNC_OUT must be connected properly to PCI_SYNC_IN, with equal delay to all PCI agent devices in the system, to allow the device to function. When the device is configured as a PCI agent device, PCI_CLK is the primary input

Table 74. QUICC Engine Block PLL Multiplication Factors (continued)

RCWL[CEPMF]	RCWL[CEPDF]	QUICC Engine PLL Multiplication Factor = RCWL[CEPMF]/ (1 + RCWL[CEPDF])
11101	0	× 29
11110	0	× 30
11111	0	× 31
00011	1	× 1.5
00101	1	× 2.5
00111	1	× 3.5
01001	1	× 4.5
01011	1	× 5.5
01101	1	× 6.5
01111	1	× 7.5
10001	1	× 8.5
10011	1	× 9.5
10101	1	× 10.5
10111	1	× 11.5
11001	1	× 12.5
11011	1	× 13.5
11101	1	× 14.5

Note:

1. Reserved modes are not listed.

The RCWL[CEVCOD] denotes the QUICC Engine Block PLL VCO internal frequency as shown in this table.

Table 75. QUICC Engine Block PLL VCO Divider

RCWL[CEVCOD]	VCO Divider
00	4
01	8
10	2
11	Reserved

NOTE

The VCO divider (RCWL[CEVCOD]) must be set properly so that the QUICC Engine block VCO frequency is in the range of 600–1400 MHz. The QUICC Engine block frequency is not restricted by the CSB and core frequencies. The CSB, core, and QUICC Engine block frequencies should be selected according to the performance requirements.

The QUICC Engine block VCO frequency is derived from the following equations:

ce_clk = (primary clock input × CEPMF) ÷ (1 + CEPDF)

QE VCO Frequency = *ce_clk* × VCO divider × (1 + CEPDF)

21.4 Suggested PLL Configurations

To simplify the PLL configurations, the device might be separated into two clock domains. The first domain contains the CSB PLL and the core PLL. The core PLL is connected serially to the CSB PLL, and has the csb_clk as its input clock. The second clock domain has the QUICC Engine block PLL. The clock domains are independent, and each of their PLLs are configured separately. Both of the domains has one common input clock. This table shows suggested PLL configurations for 33 and 66 MHz input clocks and illustrates each of the clock domains separately. Any combination of clock domains setting with same input clock are valid. Refer to Section 21, "Clocking," for the appropriate operating frequencies for your device.

Table 76. Suggested PLL Configurations

Conf No.[1]	SPMF	CORE PLL	CEPMF	CEPDF	Input Clock Freq (MHz)	CSB Freq (MHz)	Core Freq (MHz)	QUICC Engine Freq (MHz)	400 (MHz)	533 (MHz)	667 (MHz)

Table 77. Package Thermal Characteristics for the TBGA Package (continued)

Characteristic	Symbol	Value	Unit	Notes
Junction-to-package natural convection on top	ψ_{JT}	1	°C/W	6

Notes

1. Junction temperature is a function of die size, on-chip power dissipation, package thermal resistance, mounting site (board) temperature, ambient temperature, airflow, power dissipation of other components on the board, and board thermal resistance.
2. Per JEDEC JESD51-2 and SEMI G38-87 with the single layer board horizontal.
3. Per JEDEC JESD51-6 with the board horizontal. 1 m/sec is approximately equal to 200 linear feet per minute (LFM).
4. Thermal resistance between the die and the printed-circuit board per JEDEC JESD51-8. Board temperature is measured on the top surface of the board near the package.
5. Thermal resistance between the die and the case top surface as measured by the cold plate method (MIL SPEC-883 Method 1012.1).
6. Thermal characterization parameter indicating the temperature difference between package top and the junction temperature per JEDEC JESD51-2. When Greek letters are not available, the thermal characterization parameter is written as Psi-JT.

22.2 Thermal Management Information

For the following sections, $P_D = (V_{DD} \times I_{DD}) + P_{I/O}$ where $P_{I/O}$ is the power dissipation of the I/O drivers. See Table 6 for typical power dissipations values.

22.2.1 Estimation of Junction Temperature with Junction-to-Ambient Thermal Resistance

An estimation of the chip junction temperature, T_J, can be obtained from the equation:

$$T_J = T_A + (R_{\theta JA} \times P_D)$$

where:

T_J = junction temperature (°C)

T_A = ambient temperature for the package (°C)

$R_{\theta JA}$ = junction-to-ambient thermal resistance (°C/W)

P_D = power dissipation in the package (W)

The junction-to-ambient thermal resistance is an industry standard value that provides a quick and easy estimation of thermal performance. As a general statement, the value obtained on a single-layer board is appropriate for a tightly packed printed-circuit board. The value obtained on the board with the internal planes is usually appropriate if the board has low power dissipation and the components are well separated. Test cases have demonstrated that errors of a factor of two (in the quantity $T_J - T_A$) are possible.

22.2.2 Estimation of Junction Temperature with Junction-to-Board Thermal Resistance

The thermal performance of a device cannot be adequately predicted from the junction-to-ambient thermal resistance. The thermal performance of any component is strongly dependent on the power dissipation of surrounding components. Additionally, the ambient temperature varies widely within the application. For many natural convection and especially closed box applications, the board temperature at the perimeter (edge) of the package is approximately the same as the local air temperature near the device. Specifying the local ambient conditions explicitly as the board temperature provides a more precise description of the local ambient conditions that determine the temperature of the device. At a known board temperature, the junction temperature is estimated using the following equation:

23.7 Pull-Up Resistor Requirements

The device requires high resistance pull-up resistors (10 kΩ is recommended) on open drain type pins including I^2C pins, Ethernet Management MDIO pin, and EPIC interrupt pins.

For more information on required pull-up resistors and the connections required for the JTAG interface, see *MPC8360E/MPC8358E PowerQUICC Design Checklist* (AN3097).

24 Ordering Information

24.1 Part Numbers Fully Addressed by this Document

This table provides the Freescale part numbering nomenclature for the MPC8360E/58E. Note that the individual part numbers correspond to a maximum processor core frequency. For available frequencies, contact your local Freescale sales office. Additionally to the processor frequency, the part numbering scheme also includes an application modifier, which may specify special application conditions. Each part number also contains a revision code that refers to the die mask revision number.

Table 80. Part Numbering Nomenclature[1]

MPC	***nnnn***	***e***	***t***	***pp***	***aa***	***a***	***a***	***A***
Product Code	**Part Identifier**	**Encryption Acceleration**	**Temperature Range**	**Package[2]**	**Processor Frequency[3]**	**Platform Frequency**	**QUICC Engine Frequency**	**Die Revision**
MPC	8358	Blank = not included E = included	Blank = 0° C T_A to 105° C T_J C= –40° C T_A to 105° C T_J	ZU = TBGA VV = TBGA (no lead)	e300 core speed AD = 266 MHz AG = 400 MHz	D = 266 MHz	E = 300 MHz G = 400 MHz	A = rev. 2.1 silicon
	8360				e300 core speed AG = 400 MHz AJ = 533 MHz AL = 667 MHz	D = 266 MHz F = 333 MHz	G = 400 MHz H = 500 MHz	A = rev. 2.1 silicon
MPC (rev. 2.0 silicon only)	8360	Blank = not included E = included	0° C T_A to 70° C T_J	ZU = TBGA VV = TBGA (no lead)	e300 core speed AH = 500 MHz AL = 667 MHz	F = 333 MHz	G = 400 MHz H = 500 MHz	—

Notes:
1. Not all processor, platform, and QUICC Engine block frequency combinations are supported. For available frequency combinations, contact your local Freescale sales office or authorized distributor.
2. See Section 20, “Package and Pin Listings,” for more information on available package types.
3. Processor core frequencies supported by parts addressed by this specification only. Not all parts described in this specification support all core frequencies. Additionally, parts addressed by part number specifications may support other maximum core frequencies.

This table shows the SVR settings by device and package type.

Table 81. SVR Settings

Device	Package	SVR (Rev. 2.0)	SVR (Rev. 2.1)
MPC8360E	TBGA	0x8048_0020	0x8048_0021
MPC8360	TBGA	0x8049_0020	0x8049_0021
