Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Active
Number of LABs/CLBs	96
Number of Logic Elements/Cells	432
Total RAM Bits	16384
Number of I/O	86
Number of Gates	15000
Voltage - Supply	2.375V ~ 2.625V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	144-LQFP
Supplier Device Package	144-TQFP (20x20)
Purchase URL	https://www.e-xfl.com/product-detail/xilinx/xc2s15-5tqg144i

General Overview

The Spartan-II family of FPGAs have a regular, flexible, programmable architecture of Configurable Logic Blocks (CLBs), surrounded by a perimeter of programmable Input/Output Blocks (IOBs). There are four Delay-Locked Loops (DLLs), one at each corner of the die. Two columns of block RAM lie on opposite sides of the die, between the CLBs and the IOB columns. These functional elements are interconnected by a powerful hierarchy of versatile routing channels (see Figure 1).

Spartan-II FPGAs are customized by loading configuration data into internal static memory cells. Unlimited reprogramming cycles are possible with this approach. Stored values in these cells determine logic functions and interconnections implemented in the FPGA. Configuration data can be read from an external serial PROM (master serial mode), or written into the FPGA in slave serial, slave parallel, or Boundary Scan modes.

Spartan-II FPGAs are typically used in high-volume applications where the versatility of a fast programmable solution adds benefits. Spartan-II FPGAs are ideal for shortening product development cycles while offering a cost-effective solution for high volume production.

Spartan-II FPGAs achieve high-performance, low-cost operation through advanced architecture and semiconductor technology. Spartan-II devices provide system clock rates up to 200 MHz. In addition to the conventional benefits of high-volume programmable logic solutions, Spartan-II FPGAs also offer on-chip synchronous single-port and dual-port RAM (block and distributed form), DLL clock drivers, programmable set and reset on all flip-flops, fast carry logic, and many other features.

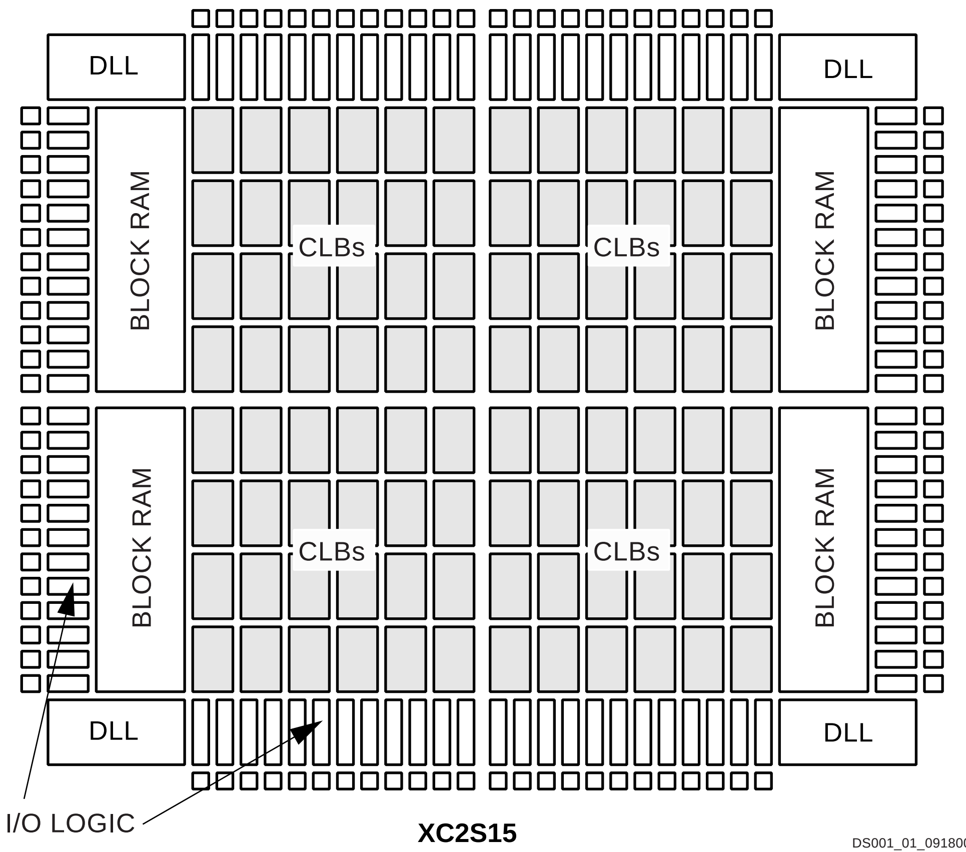

Figure 1: **Basic Spartan-II Family FPGA Block Diagram**

Boundary-scan operation is independent of individual IOB configurations, and unaffected by package type. All IOBs, including unbonded ones, are treated as independent 3-state bidirectional pins in a single scan chain. Retention of the bidirectional test capability after configuration facilitates the testing of external interconnections.

Table 7 lists the boundary-scan instructions supported in Spartan-II FPGAs. Internal signals can be captured during EXTEST by connecting them to unbonded or unused IOBs. They may also be connected to the unused outputs of IOBs defined as unidirectional input pins.

Table 7: **Boundary-Scan Instructions**

Boundary-Scan Command	Binary Code[4:0]	Description
EXTEST	00000	Enables boundary-scan EXTEST operation
SAMPLE	00001	Enables boundary-scan SAMPLE operation
USR1	00010	Access user-defined register 1
USR2	00011	Access user-defined register 2
CFG_OUT	00100	Access the configuration bus for Readback
CFG_IN	00101	Access the configuration bus for Configuration
INTEST	00111	Enables boundary-scan INTEST operation
USRCODE	01000	Enables shifting out USER code
IDCODE	01001	Enables shifting out of ID Code
HIZ	01010	Disables output pins while enabling the Bypass Register
JSTART	01100	Clock the start-up sequence when StartupClk is TCK
BYPASS	11111	Enables BYPASS
RESERVED	All other codes	Xilinx® reserved instructions

The public boundary-scan instructions are available prior to configuration. After configuration, the public instructions remain available together with any USERCODE instructions installed during the configuration. While the SAMPLE and BYPASS instructions are available during configuration, it is recommended that boundary-scan operations not be performed during this transitional period.

In addition to the test instructions outlined above, the boundary-scan circuitry can be used to configure the FPGA, and also to read back the configuration data.

To facilitate internal scan chains, the User Register provides three outputs (Reset, Update, and Shift) that represent the corresponding states in the boundary-scan internal state machine.

Configuration

Configuration is the process by which the bitstream of a design, as generated by the Xilinx software, is loaded into the internal configuration memory of the FPGA. Spartan-II devices support both serial configuration, using the master/slave serial and JTAG modes, as well as byte-wide configuration employing the Slave Parallel mode.

Configuration File

Spartan-II devices are configured by sequentially loading frames of data that have been concatenated into a configuration file. Table 8 shows how much nonvolatile storage space is needed for Spartan-II devices.

It is important to note that, while a PROM is commonly used to store configuration data before loading them into the FPGA, it is by no means required. Any of a number of different kinds of under populated nonvolatile storage already available either on or off the board (i.e., hard drives, FLASH cards, etc.) can be used. For more information on configuration without a PROM, refer to XAPP098, *The Low-Cost, Efficient Serial Configuration of Spartan FPGAs*.

Table 8: **Spartan-II Configuration File Size**

Device	Configuration File Size (Bits)
XC2S15	197,696
XC2S30	336,768
XC2S50	559,200
XC2S100	781,216
XC2S150	1,040,096
XC2S200	1,335,840

Modes

Spartan-II devices support the following four configuration modes:

- Slave Serial mode
- Master Serial mode
- Slave Parallel mode
- Boundary-scan mode

The Configuration mode pins (M2, M1, M0) select among these configuration modes with the option in each case of having the IOB pins either pulled up or left floating prior to the end of configuration. The selection codes are listed in Table 9.

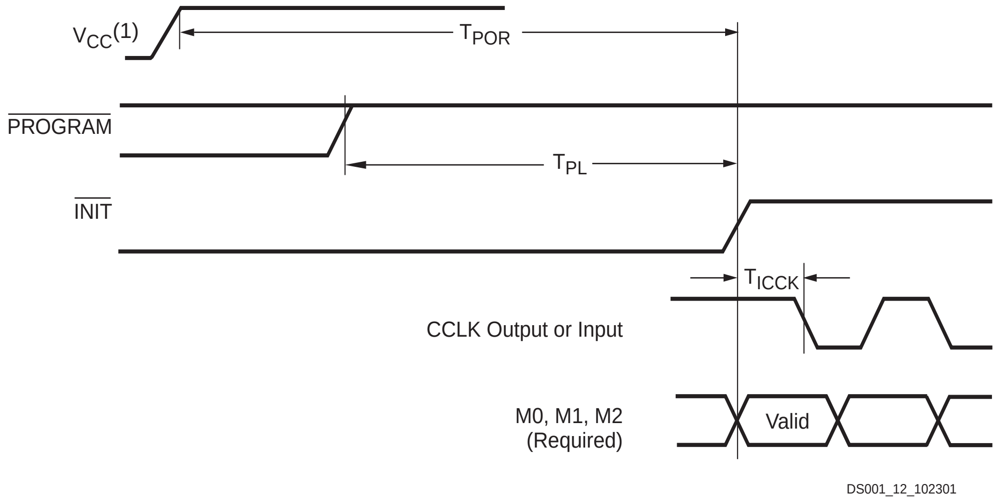
Configuration through the boundary-scan port is always available, independent of the mode selection. Selecting the boundary-scan mode simply turns off the other modes. The three mode pins have internal pull-up resistors, and default to a logic High if left unconnected.

Table 9: **Configuration Modes**

Configuration Mode	Preconfiguration Pull-ups	M0	M1	M2	CCLK Direction	Data Width	Serial D_{OUT}
Master Serial mode	No	0	0	0	Out	1	Yes
	Yes	0	0	1			
Slave Parallel mode	Yes	0	1	0	In	8	No
	No	0	1	1			
Boundary-Scan mode	Yes	1	0	0	N/A	1	No
	No	1	0	1			
Slave Serial mode	Yes	1	1	0	In	1	Yes
	No	1	1	1			

Notes:

1. During power-on and throughout configuration, the I/O drivers will be in a high-impedance state. After configuration, all unused I/Os (those not assigned signals) will remain in a high-impedance state. Pins used as outputs may pulse High at the end of configuration (see Answer 10504).
2. If the Mode pins are set for preconfiguration pull-ups, those resistors go into effect once the rising edge of INIT samples the Mode pins. They will stay in effect until GTS is released during startup, after which the UnusedPin bitstream generator option will determine whether the unused I/Os have a pull-up, pull-down, or no resistor.



Symbol	Description	Min	Max
T_{POR}	Power-on reset	-	2 ms
T_{PL}	Program latency	-	100 µs
T_{ICCK}	CCLK output delay (Master Serial mode only)	0.5 µs	4 µs
$T_{PROGRAM}$	Program pulse width	300 ns	-

Notes: (referring to waveform above:)
1. Before configuration can begin, V_{CCINT} must be greater than 1.6V and V_{CCO} Bank 2 must be greater than 1.0V.

Figure 12: **Configuration Timing on Power-Up**

Clearing Configuration Memory

The device indicates that clearing the configuration memory is in progress by driving $\overline{\text{INIT}}$ Low. At this time, the user can delay configuration by holding either $\overline{\text{PROGRAM}}$ or $\overline{\text{INIT}}$ Low, which causes the device to remain in the memory clearing phase. Note that the bidirectional $\overline{\text{INIT}}$ line is driving a Low logic level during memory clearing. To avoid contention, use an open-drain driver to keep $\overline{\text{INIT}}$ Low.

With no delay in force, the device indicates that the memory is completely clear by driving $\overline{\text{INIT}}$ High. The FPGA samples its mode pins on this Low-to-High transition.

Loading Configuration Data

Once $\overline{\text{INIT}}$ is High, the user can begin loading configuration data frames into the device. The details of loading the configuration data are discussed in the sections treating the configuration modes individually. The sequence of operations necessary to load configuration data using the serial modes is shown in Figure 14. Loading data using the Slave Parallel mode is shown in Figure 19, page 25.

CRC Error Checking

During the loading of configuration data, a CRC value embedded in the configuration file is checked against a CRC value calculated within the FPGA. If the CRC values do not match, the FPGA drives $\overline{\text{INIT}}$ Low to indicate that a frame error has occurred and configuration is aborted.

To reconfigure the device, the $\overline{\text{PROGRAM}}$ pin should be asserted to reset the configuration logic. Recycling power also resets the FPGA for configuration. See "Clearing Configuration Memory".

Start-up

The start-up sequence oversees the transition of the FPGA from the configuration state to full user operation. A match of CRC values, indicating a successful loading of the configuration data, initiates the sequence.

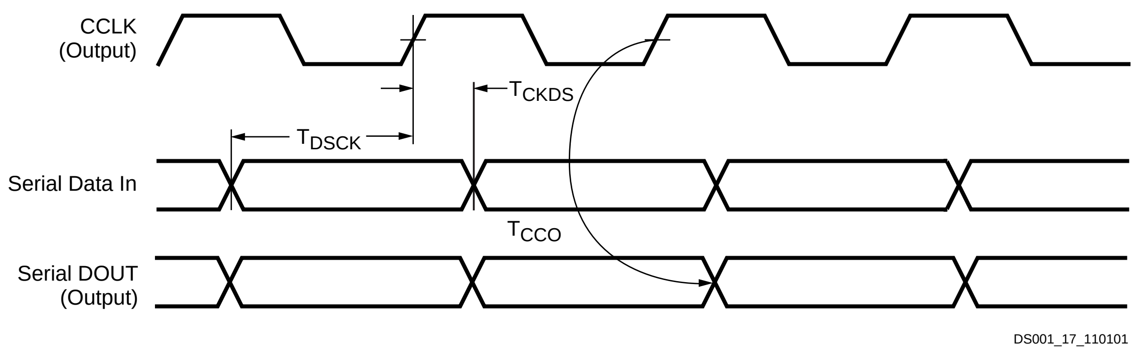
During start-up, the device performs four operations:

1. The assertion of DONE. The failure of DONE to go High may indicate the unsuccessful loading of configuration data.
2. The release of the Global Three State net. This activates I/Os to which signals are assigned. The remaining I/Os stay in a high-impedance state with internal weak pull-down resistors present.
3. Negates Global Set Reset (GSR). This allows all flip-flops to change state.
4. The assertion of Global Write Enable (GWE). This allows all RAMs and flip-flops to change state.

Master Serial Mode

In Master Serial mode, the CCLK output of the FPGA drives a Xilinx PROM which feeds a serial stream of configuration data to the FPGA's DIN input. Figure 15 shows a Master Serial FPGA configuring a Slave Serial FPGA from a PROM. A Spartan-II device in Master Serial mode should be connected as shown for the device on the left side. Master Serial mode is selected by a <00x> on the mode pins (M0, M1, M2). The PROM RESET pin is driven by $\overline{\text{INIT}}$, and CE input is driven by DONE. The interface is identical to the slave serial mode except that an oscillator internal to the FPGA is used to generate the configuration clock (CCLK). Any of a number of different frequencies ranging from 4 to 60 MHz can be set using the ConfigRate option in the Xilinx software. On power-up, while the first 60 bytes of the configuration data are being loaded, the CCLK frequency is always 2.5 MHz. This frequency is used until the ConfigRate bits, part of the configuration file, have been loaded into the FPGA, at which point, the frequency changes to the selected ConfigRate. Unless a different frequency is specified in the design, the default ConfigRate is 4 MHz. The frequency of the CCLK signal created by the internal oscillator has a variance of +45%, –30% from the specified value.

Figure 17 shows the timing for Master Serial configuration. The FPGA accepts one bit of configuration data on each rising CCLK edge. After the FPGA has been loaded, the data for the next device in a daisy-chain is presented on the DOUT pin after the rising CCLK edge.



Symbol		Description		Units
T_{DSCK}	CCLK	DIN setup	5.0	ns, min
T_{CKDS}		DIN hold	0.0	ns, min
		Frequency tolerance with respect to nominal	+45%, –30%	-

Figure 17: **Master Serial Mode Timing**

Slave Parallel Mode

The Slave Parallel mode is the fastest configuration option. Byte-wide data is written into the FPGA. A BUSY flag is provided for controlling the flow of data at a clock frequency F_{CCNH} above 50 MHz.

Figure 18, page 24 shows the connections for two Spartan-II devices using the Slave Parallel mode. Slave Parallel mode is selected by a <011> on the mode pins (M0, M1, M2).

If a configuration file of the format .bit, .rbt, or non-swapped HEX is used for parallel programming, then the most significant bit (i.e. the left-most bit of each configuration byte, as displayed in a text editor) must be routed to the D0 input on the FPGA.

The agent controlling configuration is not shown. Typically, a processor, a microcontroller, or CPLD controls the Slave Parallel interface. The controlling agent provides byte-wide configuration data, CCLK, a Chip Select ($\overline{\text{CS}}$) signal and a Write signal ($\overline{\text{WRITE}}$). If BUSY is asserted (High) by the FPGA, the data must be held until BUSY goes Low.

After configuration, the pins of the Slave Parallel port (D0-D7) can be used as additional user I/O. Alternatively, the port may be retained to permit high-speed 8-bit readback. Then data can be read by de-asserting $\overline{\text{WRITE}}$. See "Readback," page 25.

If CCLK is slower than F_{CCNH}, the FPGA will never assert BUSY. In this case, the above handshake is unnecessary, and data can simply be entered into the FPGA every CCLK cycle.

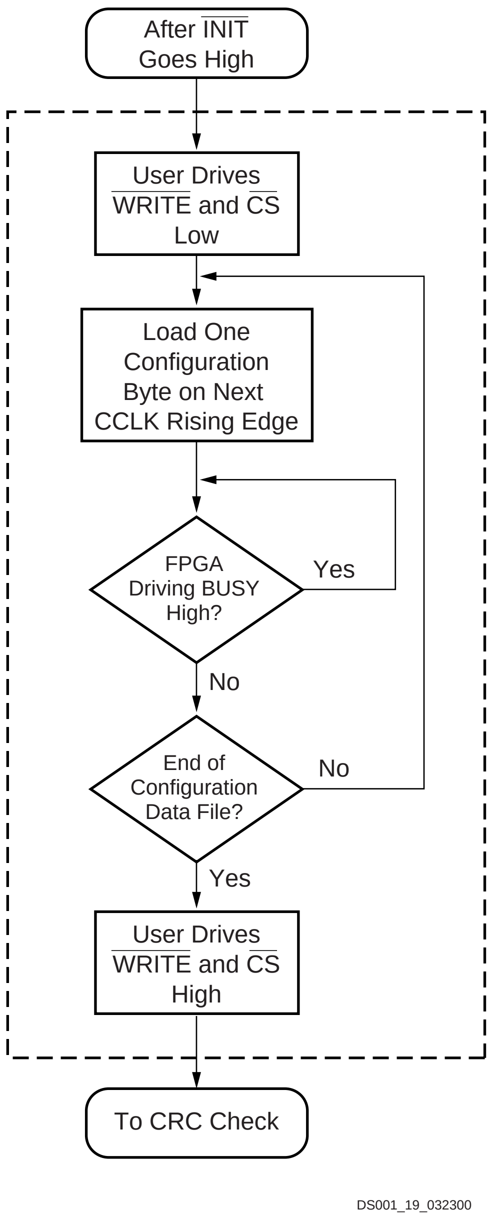


Figure 19: **Loading Configuration Data for the Slave Parallel Mode**

A configuration packet does not have to be written in one continuous stretch, rather it can be split into many write sequences. Each sequence would involve assertion of CS.

In applications where multiple clock cycles may be required to access the configuration data before each byte can be loaded into the Slave Parallel interface, a new byte of data may not be ready for each consecutive CCLK edge. In such a case the CS signal may be de-asserted until the next byte is valid on D0-D7. While CS is High, the Slave Parallel interface does not expect any data and ignores all CCLK transitions. However, to avoid aborting configuration, WRITE must continue to be asserted while CS is asserted.

Abort

To abort configuration during a write sequence, de-assert WRITE while holding CS Low. The abort operation is initiated at the rising edge of CCLK, as shown in Figure 21, page 26. The device will remain BUSY until the aborted operation is complete. After aborting configuration, data is assumed to be unaligned to word boundaries and the FPGA requires a new synchronization word prior to accepting any new packets.

Boundary-Scan Mode

In the boundary-scan mode, no nondedicated pins are required, configuration being done entirely through the IEEE 1149.1 Test Access Port.

Configuration through the TAP uses the special CFG_IN instruction. This instruction allows data input on TDI to be converted into data packets for the internal configuration bus.

The following steps are required to configure the FPGA through the boundary-scan port.

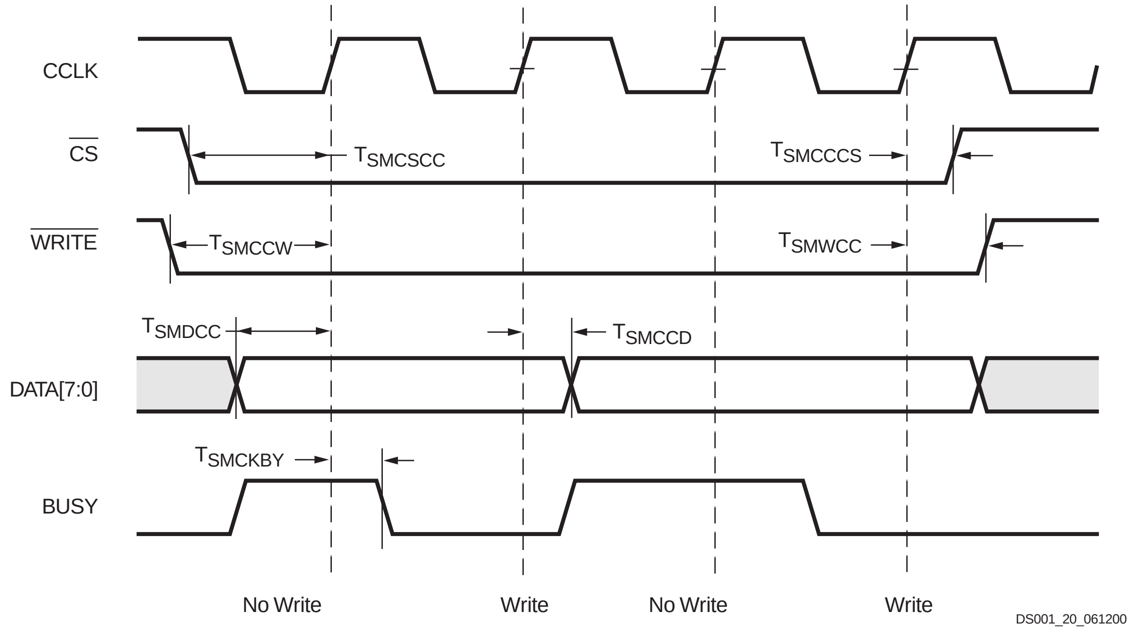
1. Load the CFG_IN instruction into the boundary-scan instruction register (IR)
2. Enter the Shift-DR (SDR) state
3. Shift a standard configuration bitstream into TDI
4. Return to Run-Test-Idle (RTI)
5. Load the JSTART instruction into IR
6. Enter the SDR state
7. Clock TCK through the sequence (the length is programmable)
8. Return to RTI

Configuration and readback via the TAP is always available. The boundary-scan mode simply locks out the other modes. The boundary-scan mode is selected by a <10x> on the mode pins (M0, M1, M2).

Readback

The configuration data stored in the Spartan-II FPGA configuration memory can be readback for verification. Along with the configuration data it is possible to readback the contents of all flip-flops/latches, LUT RAMs, and block RAMs. This capability is used for real-time debugging.

For more detailed information see XAPP176, *Spartan-II FPGA Family Configuration and Readback.*



Symbol		Description		Units
T_{SMDCC}	CCLK	D0-D7 setup/hold	5	ns, min
T_{SMCCD}		D0-D7 hold	0	ns, min
T_{SMCSCC}		$\overline{CS}$ setup	7	ns, min
T_{SMCCCS}		$\overline{CS}$ hold	0	ns, min
T_{SMCCW}		$\overline{WRITE}$ setup	7	ns, min
T_{SMWCC}		$\overline{WRITE}$ hold	0	ns, min
T_{SMCKBY}		BUSY propagation delay	12	ns, max
F_{CC}		Maximum frequency	66	MHz, max
F_{CCNH}		Maximum frequency with no handshake	50	MHz, max

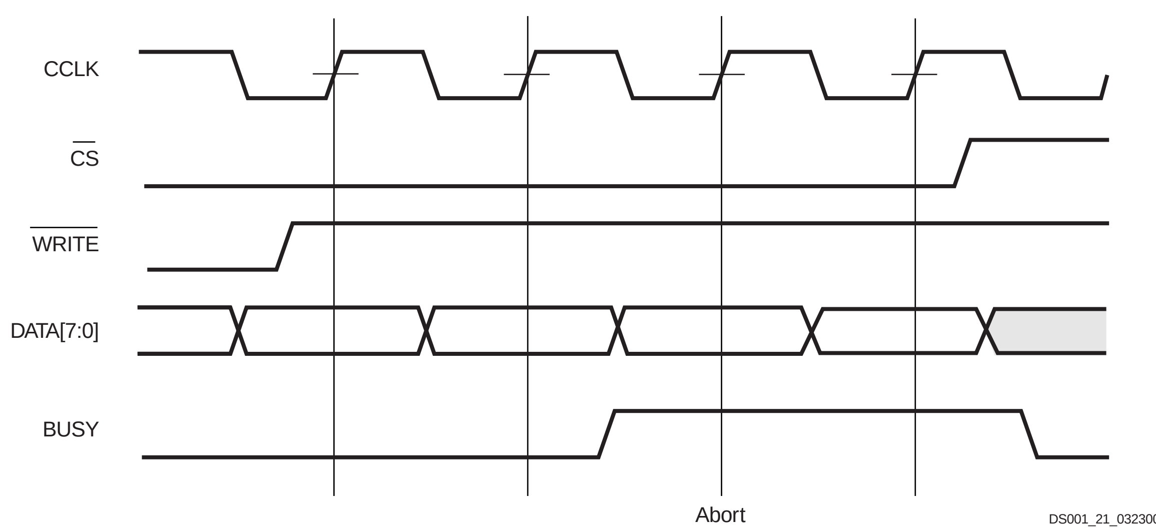

Figure 21: **Slave Parallel Write Abort Waveforms**

Using Block RAM Features

The Spartan-II FPGA family provides dedicated blocks of on-chip, true dual-read/write port synchronous RAM, with 4096 memory cells. Each port of the block RAM memory can be independently configured as a read/write port, a read port, a write port, and can be configured to a specific data width. The block RAM memory offers new capabilities allowing the FPGA designer to simplify designs.

Operating Modes

Block RAM memory supports two operating modes.

- Read Through
- Write Back

Read Through (One Clock Edge)

The read address is registered on the read port clock edge and data appears on the output after the RAM access time. Some memories may place the latch/register at the outputs depending on the desire to have a faster clock-to-out versus setup time. This is generally considered to be an inferior solution since it changes the read operation to an asynchronous function with the possibility of missing an address/control line transition during the generation of the read pulse clock.

Write Back (One Clock Edge)

The write address is registered on the write port clock edge and the data input is written to the memory and mirrored on the write port input.

Block RAM Characteristics

1. All inputs are registered with the port clock and have a setup to clock timing specification.
2. All outputs have a read through or write back function depending on the state of the port WE pin. The outputs relative to the port clock are available after the clock-to-out timing specification.
3. The block RAM are true SRAM memories and do not have a combinatorial path from the address to the output. The LUT cells in the CLBs are still available with this function.
4. The ports are completely independent from each other (*i.e.,* clocking, control, address, read/write function, and data width) without arbitration.
5. A write operation requires only one clock edge.
6. A read operation requires only one clock edge.

The output ports are latched with a self timed circuit to guarantee a glitch free read. The state of the output port will not change until the port executes another read or write operation.

Library Primitives

Figure 31 and Figure 32 show the two generic library block RAM primitives. Table 11 describes all of the available primitives for synthesis and simulation.

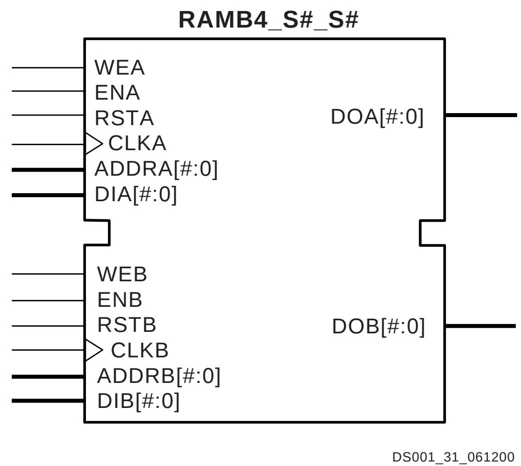

Figure 31: **Dual-Port Block RAM Memory**

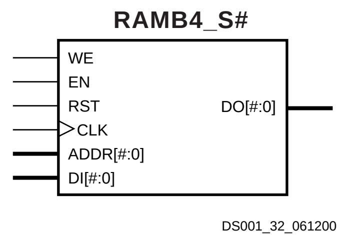

Figure 32: **Single-Port Block RAM Memory**

Table 11: **Available Library Primitives**

Primitive	Port A Width	Port B Width
RAMB4_S1 RAMB4_S1_S1 RAMB4_S1_S2 RAMB4_S1_S4 RAMB4_S1_S8 RAMB4_S1_S16	1	N/A 1 2 4 8 16
RAMB4_S2 RAMB4_S2_S2 RAMB4_S2_S4 RAMB4_S2_S8 RAMB4_S2_S16	2	N/A 2 4 8 16

property. This property could have one of the following seven values.

DRIVE=2

DRIVE=4

DRIVE=6

DRIVE=8

DRIVE=12 (Default)

DRIVE=16

DRIVE=24

Design Considerations

Reference Voltage (V_{REF}) Pins

Low-voltage I/O standards with a differential amplifier input buffer require an input reference voltage (V_{REF}). Provide the V_{REF} as an external signal to the device.

The voltage reference signal is "banked" within the device on a half-edge basis such that for all packages there are eight independent V_{REF} banks internally. See Figure 36, page 39 for a representation of the I/O banks. Within each bank approximately one of every six I/O pins is automatically configured as a V_{REF} input.

Within each V_{REF} bank, any input buffers that require a V_{REF} signal must be of the same type. Output buffers of any type and input buffers can be placed without requiring a reference voltage within the same V_{REF} bank.

Output Drive Source Voltage (V_{CCO}) Pins

Many of the low voltage I/O standards supported by Versatile I/Os require a different output drive source voltage (V_{CCO}). As a result each device can often have to support multiple output drive source voltages.

The V_{CCO} supplies are internally tied together for some packages. The VQ100 and the PQ208 provide one combined V_{CCO} supply. The TQ144 and the CS144 packages provide four independent V_{CCO} supplies. The FG256 and the FG456 provide eight independent V_{CCO} supplies.

Output buffers within a given V_{CCO} bank must share the same output drive source voltage. Input buffers for LVTTL, LVCMOS2, PCI33_3, and PCI 66_3 use the V_{CCO} voltage for Input V_{CCO} voltage.

Transmission Line Effects

The delay of an electrical signal along a wire is dominated by the rise and fall times when the signal travels a short distance. Transmission line delays vary with inductance and capacitance, but a well-designed board can experience delays of approximately 180 ps per inch.

Transmission line effects, or reflections, typically start at 1.5" for fast (1.5 ns) rise and fall times. Poor (or non-existent) termination or changes in the transmission line impedance cause these reflections and can cause additional delay in longer traces. As system speeds continue to increase, the effect of I/O delays can become a limiting factor and therefore transmission line termination becomes increasingly more important.

Termination Techniques

A variety of termination techniques reduce the impact of transmission line effects.

The following lists output termination techniques:

None
Series
Parallel (Shunt)
Series and Parallel (Series-Shunt)

Input termination techniques include the following:

None
Parallel (Shunt)

These termination techniques can be applied in any combination. A generic example of each combination of termination methods appears in Figure 41.

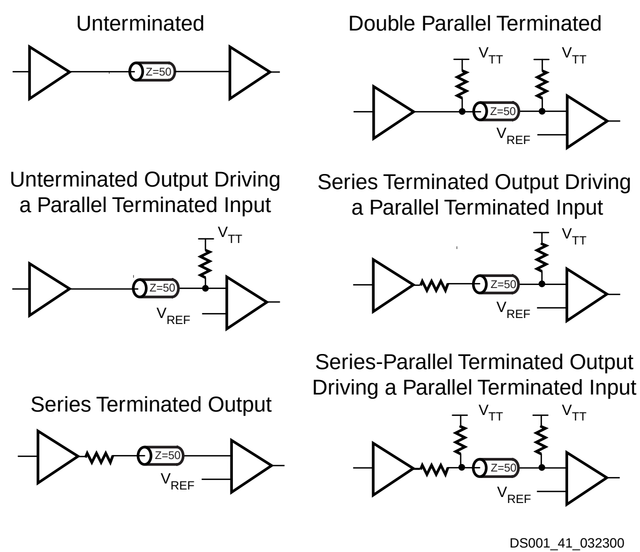

Figure 41: **Overview of Standard Input and Output Termination Methods**

Simultaneous Switching Guidelines

Ground bounce can occur with high-speed digital ICs when multiple outputs change states simultaneously, causing undesired transient behavior on an output, or in the internal logic. This problem is also referred to as the Simultaneous Switching Output (SSO) problem.

Ground bounce is primarily due to current changes in the combined inductance of ground pins, bond wires, and

GTL

A sample circuit illustrating a valid termination technique for GTL is shown in Figure 42. Table 20 lists DC voltage specifications for the GTL standard. See "DC Specifications" in Module 3 for the actual FPGA characteristics.

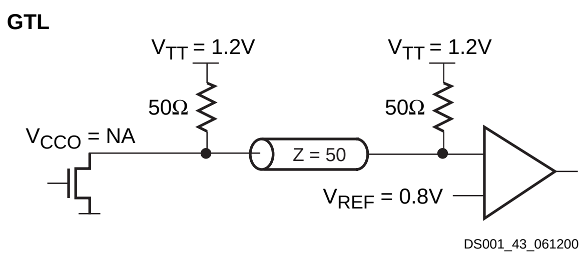

Figure 42: **Terminated GTL**

Table 20: **GTL Voltage Specifications**

Parameter	Min	Typ	Max
V_{CCO}	-	N/A	-
$V_{REF} = N \times V_{TT}^{(1)}$	0.74	0.8	0.86
V_{TT}	1.14	1.2	1.26
$V_{IH} \geq V_{REF} + 0.05$	0.79	0.85	-
$V_{IL} \leq V_{REF} - 0.05$	-	0.75	0.81
V_{OH}	-	-	-
V_{OL}	-	0.2	0.4
I_{OH} at V_{OH} (mA)	-	-	-
I_{OL} at V_{OL} (mA) at 0.4V	32	-	-
I_{OL} at V_{OL} (mA) at 0.2V	-	-	40

Notes:
1. N must be greater than or equal to 0.653 and less than or equal to 0.68.

GTL+

A sample circuit illustrating a valid termination technique for GTL+ appears in Figure 43. DC voltage specifications appear in Table 21 for the GTL+ standard. See "DC Specifications" in Module 3 for the actual FPGA characteristics.

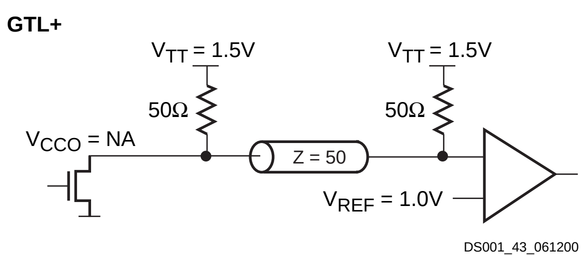

Figure 43: **Terminated GTL+**

Table 21: **GTL+ Voltage Specifications**

Parameter	Min	Typ	Max
V_{CCO}	-	-	-
$V_{REF} = N \times V_{TT}^{(1)}$	0.88	1.0	1.12
V_{TT}	1.35	1.5	1.65
$V_{IH} \geq V_{REF} + 0.1$	0.98	1.1	-
$V_{IL} \leq V_{REF} - 0.1$	-	0.9	1.02
V_{OH}	-	-	-
V_{OL}	0.3	0.45	0.6
I_{OH} at V_{OH} (mA)	-	-	-
I_{OL} at V_{OL} (mA) at 0.6V	36	-	-
I_{OL} at V_{OL} (mA) at 0.3V	-	-	48

Notes:
1. N must be greater than or equal to 0.653 and less than or equal to 0.68.

HSTL Class I

A sample circuit illustrating a valid termination technique for HSTL_I appears in Figure 44. DC voltage specifications appear in Table 22 for the HSTL_1 standard. See "DC Specifications" in Module 3 for the actual FPGA characteristics.

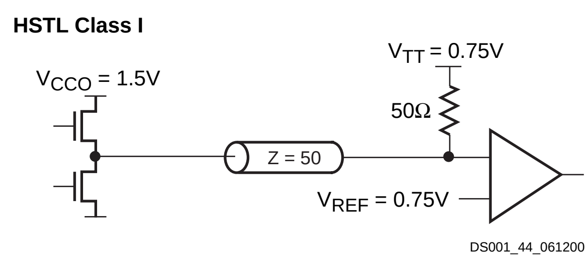

Figure 44: **Terminated HSTL Class I**

Table 22: **HSTL Class I Voltage Specification**

Parameter	Min	Typ	Max
V_{CCO}	1.40	1.50	1.60
V_{REF}	0.68	0.75	0.90
V_{TT}	-	$V_{CCO} \times 0.5$	-
V_{IH}	$V_{REF} + 0.1$	-	-
V_{IL}	-	-	$V_{REF} - 0.1$
V_{OH}	$V_{CCO} - 0.4$	-	-
V_{OL}			0.4
I_{OH} at V_{OH} (mA)	–8	-	-
I_{OL} at V_{OL} (mA)	8	-	-

SSTL3 Class I

A sample circuit illustrating a valid termination technique for SSTL3_I appears in Figure 47. DC voltage specifications appear in Table 25 for the SSTL3_I standard. See "DC Specifications" in Module 3 for the actual FPGA characteristics.

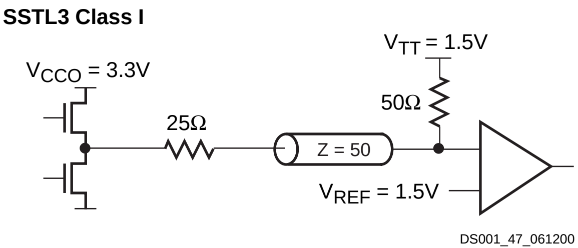

Figure 47: **Terminated SSTL3 Class I**

Table 25: **SSTL3_I Voltage Specifications**

Parameter	Min	Typ	Max
V_{CCO}	3.0	3.3	3.6
$V_{REF} = 0.45 \times V_{CCO}$	1.3	1.5	1.7
$V_{TT} = V_{REF}$	1.3	1.5	1.7
$V_{IH} \geq V_{REF} + 0.2$	1.5	1.7	3.9(1)
$V_{IL} \leq V_{REF} - 0.2$	–0.3(2)	1.3	1.5
$V_{OH} \geq V_{REF} + 0.6$	1.9	-	-
$V_{OL} \leq V_{REF} - 0.6$	-	-	1.1
I_{OH} at V_{OH} (mA)	–8	-	-
I_{OL} at V_{OL} (mA)	8	-	-

Notes:
1. V_{IH} maximum is V_{CCO} + 0.3.
2. V_{IL} minimum does not conform to the formula.

SSTL3 Class II

A sample circuit illustrating a valid termination technique for SSTL3_II appears in Figure 48. DC voltage specifications appear in Table 26 for the SSTL3_II standard. See "DC Specifications" in Module 3 for the actual FPGA characteristics.

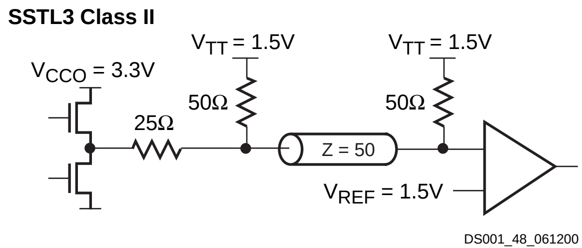

Figure 48: **Terminated SSTL3 Class II**

Table 26: **SSTL3_II Voltage Specifications**

Parameter	Min	Typ	Max
V_{CCO}	3.0	3.3	3.6
$V_{REF} = 0.45 \times V_{CCO}$	1.3	1.5	1.7
$V_{TT} = V_{REF}$	1.3	1.5	1.7
$V_{IH} \geq V_{REF} + 0.2$	1.5	1.7	3.9(1)
$V_{IL} \leq V_{REF} - 0.2$	–0.3(2)	1.3	1.5
$V_{OH} \geq V_{REF} + 0.8$	2.1	-	-
$V_{OL} \leq V_{REF} - 0.8$	-	-	0.9
I_{OH} at V_{OH} (mA)	–16	-	-
I_{OL} at V_{OL} (mA)	16	-	-

Notes:
1. V_{IH} maximum is V_{CCO} + 0.3
2. V_{IL} minimum does not conform to the formula

Revision History

Date	Version	Description
09/18/00	2.0	Sectioned the Spartan-II Family data sheet into four modules. Corrected banking description.
03/05/01	2.1	Clarified guidelines for applying power to V_{CCINT} and V_{CCO}
09/03/03	2.2	The following changes were made: • "Serial Modes," page 20 cautions about toggling $\overline{\text{WRITE}}$ during serial configuration. • Maximum V_{IH} values in Table 32 and Table 33 changed to 5.5V. • In "Boundary Scan," page 13, removed sentence about lack of INTEST support. • In Table 9, page 17, added note about the state of I/Os after power-on. • In "Slave Parallel Mode," page 23, explained configuration bit alignment to SelectMap port.
06/13/08	2.8	Added note that TDI, TMS, and TCK have a default pull-up resistor. Added note on maximum daisy chain limit. Updated Figure 15 and Figure 18 since Mode pins can be pulled up to either 2.5V or 3.3V. Updated DLL section. Recommended using property or attribute instead of primitive to define I/O properties. Updated description and links. Updated all modules for continuous page, figure, and table numbering. Synchronized all modules to v2.8.

Global Clock Setup and Hold for LVTTL Standard, *with* DLL (Pin-to-Pin)

Symbol	Description	Device	Speed Grade -6 Min	Speed Grade -5 Min	Units
T_{PSDLL} / T_{PHDLL}	Input setup and hold time relative to global clock input signal for LVTTL standard, no delay, IFF,(1) with DLL	All	1.7 / 0	1.9 / 0	ns

Notes:
1. IFF = Input Flip-Flop or Latch
2. Setup time is measured relative to the Global Clock input signal with the fastest route and the lightest load. Hold time is measured relative to the Global Clock input signal with the slowest route and heaviest load.
3. DLL output jitter is already included in the timing calculation.
4. A zero hold time listing indicates no hold time or a negative hold time.
5. For data input with different standards, adjust the setup time delay by the values shown in "IOB Input Delay Adjustments for Different Standards," page 57. For a global clock input with standards other than LVTTL, adjust delays with values from the "I/O Standard Global Clock Input Adjustments," page 61.

Global Clock Setup and Hold for LVTTL Standard, *without* DLL (Pin-to-Pin)

Symbol	Description	Device	Speed Grade -6 Min	Speed Grade -5 Min	Units
T_{PSFD} / T_{PHFD}	Input setup and hold time relative to global clock input signal for LVTTL standard, no delay, IFF,(1) without DLL	XC2S15	2.2 / 0	2.7 / 0	ns
		XC2S30	2.2 / 0	2.7 / 0	ns
		XC2S50	2.2 / 0	2.7 / 0	ns
		XC2S100	2.3 / 0	2.8 / 0	ns
		XC2S150	2.4 / 0	2.9 / 0	ns
		XC2S200	2.4 / 0	3.0 / 0	ns

Notes:
1. IFF = Input Flip-Flop or Latch
2. Setup time is measured relative to the Global Clock input signal with the fastest route and the lightest load. Hold time is measured relative to the Global Clock input signal with the slowest route and heaviest load.
3. A zero hold time listing indicates no hold time or a negative hold time.
4. For data input with different standards, adjust the setup time delay by the values shown in "IOB Input Delay Adjustments for Different Standards," page 57. For a global clock input with standards other than LVTTL, adjust delays with values from the "I/O Standard Global Clock Input Adjustments," page 61.

IOB Input Switching Characteristics(1)

Input delays associated with the pad are specified for LVTTL levels. For other standards, adjust the delays with the values shown in "IOB Input Delay Adjustments for Different Standards," page 57.

Symbol	Description	Device	Speed Grade -6 Min	Speed Grade -6 Max	Speed Grade -5 Min	Speed Grade -5 Max	Units
Propagation Delays							
T_{IOPI}	Pad to I output, no delay	All	-	0.8	-	1.0	ns
T_{IOPID}	Pad to I output, with delay	All	-	1.5	-	1.8	ns
T_{IOPLI}	Pad to output IQ via transparent latch, no delay	All	-	1.7	-	2.0	ns
T_{IOPLID}	Pad to output IQ via transparent latch, with delay	XC2S15	-	3.8	-	4.5	ns
		XC2S30	-	3.8	-	4.5	ns
		XC2S50	-	3.8	-	4.5	ns
		XC2S100	-	3.8	-	4.5	ns
		XC2S150	-	4.0	-	4.7	ns
		XC2S200	-	4.0	-	4.7	ns
Sequential Delays							
T_{IOCKIQ}	Clock CLK to output IQ	All	-	0.7	-	0.8	ns
Setup/Hold Times with Respect to Clock CLK(2)							
T_{IOPICK} / T_{IOICKP}	Pad, no delay	All	1.7 / 0	-	1.9 / 0	-	ns
$T_{IOPICKD}$ / $T_{IOICKPD}$	Pad, with delay(1)	XC2S15	3.8 / 0	-	4.4 / 0	-	ns
		XC2S30	3.8 / 0	-	4.4 / 0	-	ns
		XC2S50	3.8 / 0	-	4.4 / 0	-	ns
		XC2S100	3.8 / 0	-	4.4 / 0	-	ns
		XC2S150	3.9 / 0	-	4.6 / 0	-	ns
		XC2S200	3.9 / 0	-	4.6 / 0	-	ns
$T_{IOICECK}$ / $T_{IOCKICE}$	ICE input	All	0.9 / 0.01	-	0.9 / 0.01	-	ns
Set/Reset Delays							
$T_{IOSRCKI}$	SR input (IFF, synchronous)	All	-	1.1	-	1.2	ns
T_{IOSRIQ}	SR input to IQ (asynchronous)	All	-	1.5	-	1.7	ns
T_{GSRQ}	GSR to output IQ	All	-	9.9	-	11.7	ns

Notes:

1. Input timing for LVTTL is measured at 1.4V. For other I/O standards, see the table "Delay Measurement Methodology," page 60.
2. A zero hold time listing indicates no hold time or a negative hold time.

Calculation of T_{IOOP} as a Function of Capacitance

T_{IOOP} is the propagation delay from the O Input of the IOB to the pad. The values for T_{IOOP} are based on the standard capacitive load (C_{SL}) for each I/O standard as listed in the table "Constants for Calculating TIOOP", below.

For other capacitive loads, use the formulas below to calculate an adjusted propagation delay, T_{IOOP1}.

$$T_{IOOP1} = T_{IOOP} + Adj + (C_{LOAD} - C_{SL}) * F_L$$

Where:

Adj is selected from "IOB Output Delay Adjustments for Different Standards", page 59, according to the I/O standard used

C_{LOAD} is the capacitive load for the design

F_L is the capacitance scaling factor

Delay Measurement Methodology

Standard	V_L (1)	V_H (1)	Meas. Point	V_{REF} Typ (2)
LVTTL	0	3	1.4	-
LVCMOS2	0	2.5	1.125	-
PCI33_5	Per PCI Spec			-
PCI33_3	Per PCI Spec			-
PCI66_3	Per PCI Spec			-
GTL	$V_{REF} - 0.2$	$V_{REF} + 0.2$	V_{REF}	0.80
GTL+	$V_{REF} - 0.2$	$V_{REF} + 0.2$	V_{REF}	1.0
HSTL Class I	$V_{REF} - 0.5$	$V_{REF} + 0.5$	V_{REF}	0.75
HSTL Class III	$V_{REF} - 0.5$	$V_{REF} + 0.5$	V_{REF}	0.90
HSTL Class IV	$V_{REF} - 0.5$	$V_{REF} + 0.5$	V_{REF}	0.90
SSTL3 I and II	$V_{REF} - 1.0$	$V_{REF} + 1.0$	V_{REF}	1.5
SSTL2 I and II	$V_{REF} - 0.75$	$V_{REF} + 0.75$	V_{REF}	1.25
CTT	$V_{REF} - 0.2$	$V_{REF} + 0.2$	V_{REF}	1.5
AGP	$V_{REF} - (0.2xV_{CCO})$	$V_{REF} + (0.2xV_{CCO})$	V_{REF}	Per AGP Spec

Notes:
1. Input waveform switches between V_L and V_H.
2. Measurements are made at V_{REF} Typ, Maximum, and Minimum. Worst-case values are reported.
3. I/O parameter measurements are made with the capacitance values shown in the table, "Constants for Calculating TIOOP". See Xilinx application note XAPP179 for the appropriate terminations.
4. I/O standard measurements are reflected in the IBIS model information except where the IBIS format precludes it.

Constants for Calculating T_{IOOP}

Standard	C_{SL} (1) (pF)	F_L (ns/pF)
LVTTL Fast Slew Rate, 2 mA drive	35	0.41
LVTTL Fast Slew Rate, 4 mA drive	35	0.20
LVTTL Fast Slew Rate, 6 mA drive	35	0.13
LVTTL Fast Slew Rate, 8 mA drive	35	0.079
LVTTL Fast Slew Rate, 12 mA drive	35	0.044
LVTTL Fast Slew Rate, 16 mA drive	35	0.043
LVTTL Fast Slew Rate, 24 mA drive	35	0.033
LVTTL Slow Slew Rate, 2 mA drive	35	0.41
LVTTL Slow Slew Rate, 4 mA drive	35	0.20
LVTTL Slow Slew Rate, 6 mA drive	35	0.100
LVTTL Slow Slew Rate, 8 mA drive	35	0.086
LVTTL Slow Slew Rate, 12 mA drive	35	0.058
LVTTL Slow Slew Rate, 16 mA drive	35	0.050
LVTTL Slow Slew Rate, 24 mA drive	35	0.048
LVCMOS2	35	0.041
PCI 33 MHz 5V	50	0.050
PCI 33 MHZ 3.3V	10	0.050
PCI 66 MHz 3.3V	10	0.033
GTL	0	0.014
GTL+	0	0.017
HSTL Class I	20	0.022
HSTL Class III	20	0.016
HSTL Class IV	20	0.014
SSTL2 Class I	30	0.028
SSTL2 Class II	30	0.016
SSTL3 Class I	30	0.029
SSTL3 Class II	30	0.016
CTT	20	0.035
AGP	10	0.037

Notes:
1. I/O parameter measurements are made with the capacitance values shown above. See Xilinx application note XAPP179 for the appropriate terminations.
2. I/O standard measurements are reflected in the IBIS model information except where the IBIS format precludes it.

DLL Timing Parameters

All devices are 100 percent functionally tested. Because of the difficulty in directly measuring many internal timing parameters, those parameters are derived from benchmark timing patterns. The following guidelines reflect worst-case values across the recommended operating conditions.

Symbol	Description	Speed Grade				Units
		-6		-5		
		Min	Max	Min	Max	
$F_{CLKINHF}$	Input clock frequency (CLKDLLHF)	60	200	60	180	MHz
$F_{CLKINLF}$	Input clock frequency (CLKDLL)	25	100	25	90	MHz
$T_{DLLPWHF}$	Input clock pulse width (CLKDLLHF)	2.0	-	2.4	-	ns
$T_{DLLPWLF}$	Input clock pulse width (CLKDLL)	2.5	-	3.0	-	ns

DLL Clock Tolerance, Jitter, and Phase Information

All DLL output jitter and phase specifications were determined through statistical measurement at the package pins using a clock mirror configuration and matched drivers.

Figure 52, page 63, provides definitions for various parameters in the table below.

Symbol	Description	F_{CLKIN}	CLKDLLHF		CLKDLL		Units
			Min	Max	Min	Max	
T_{IPTOL}	Input clock period tolerance		-	1.0	-	1.0	ns
T_{IJITCC}	Input clock jitter tolerance (cycle-to-cycle)		-	±150	-	±300	ps
T_{LOCK}	Time required for DLL to acquire lock	> 60 MHz	-	20	-	20	µs
		50-60 MHz	-	-	-	25	µs
		40-50 MHz	-	-	-	50	µs
		30-40 MHz	-	-	-	90	µs
		25-30 MHz	-	-	-	120	µs
T_{OJITCC}	Output jitter (cycle-to-cycle) for any DLL clock output(1)		-	±60	-	±60	ps
T_{PHIO}	Phase offset between CLKIN and CLKO(2)		-	±100	-	±100	ps
T_{PHOO}	Phase offset between clock outputs on the DLL(3)		-	±140	-	±140	ps
T_{PHIOM}	Maximum phase difference between CLKIN and CLKO(4)		-	±160	-	±160	ps
T_{PHOOM}	Maximum phase difference between clock outputs on the DLL(5)		-	±200	-	±200	ps

Notes:
1. **Output Jitter** is cycle-to-cycle jitter measured on the DLL output clock, *excluding* input clock jitter.
2. **Phase Offset between CLKIN and CLKO** is the worst-case fixed time difference between rising edges of CLKIN and CLKO, *excluding* output jitter and input clock jitter.
3. **Phase Offset between Clock Outputs on the DLL** is the worst-case fixed time difference between rising edges of any two DLL outputs, *excluding* Output Jitter and input clock jitter.
4. **Maximum Phase Difference between CLKIN an CLKO** is the sum of Output Jitter and Phase Offset between CLKIN and CLKO, or the greatest difference between CLKIN and CLKO rising edges due to DLL alone (*excluding* input clock jitter).
5. **Maximum Phase Difference between Clock Outputs on the DLL** is the sum of Output JItter and Phase Offset between any DLL clock outputs, or the greatest difference between any two DLL output rising edges due to DLL alone (*excluding* input clock jitter).

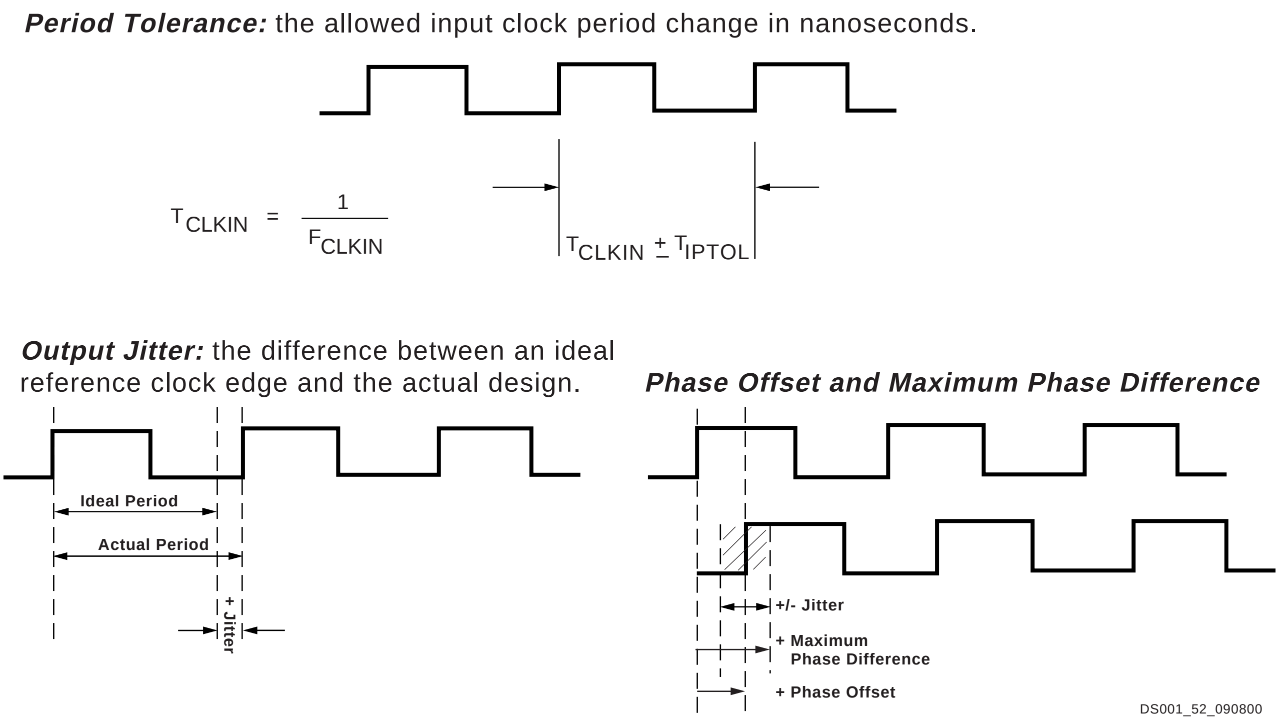

Figure 52: **Period Tolerance and Clock Jitter**

Table 36: **Spartan-II Family Package Options**

Package	Leads	Type	Maximum I/O	Lead Pitch (mm)	Footprint Area (mm)	Height (mm)	Mass[(1)] (g)
VQ100 / VQG100	100	Very Thin Quad Flat Pack (VQFP)	60	0.5	16 x 16	1.20	0.6
TQ144 / TQG144	144	Thin Quad Flat Pack (TQFP)	92	0.5	22 x 22	1.60	1.4
CS144 / CSG144	144	Chip Scale Ball Grid Array (CSBGA)	92	0.8	12 x 12	1.20	0.3
PQ208 / PQG208	208	Plastic Quad Flat Pack (PQFP)	140	0.5	30.6 x 30.6	3.70	5.3
FG256 / FGG256	256	Fine-pitch Ball Grid Array (FBGA)	176	1.0	17 x 17	2.00	0.9
FG456 / FGG456	456	Fine-pitch Ball Grid Array (FBGA)	284	1.0	23 x 23	2.60	2.2

Notes:
1. Package mass is ±10%.

Note: Some early versions of Spartan-II devices, including the XC2S15 and XC2S30 ES devices and the XC2S150 with date code 0045 or earlier, included a power-down pin. For more information, see Answer Record 10500.

VCCO Banks

Some of the I/O standards require specific V_{CCO} voltages. These voltages are externally connected to device pins that serve groups of IOBs, called banks. Eight I/O banks result from separating each edge of the FPGA into two banks (see Figure 3 in Module 2). Each bank has multiple V_{CCO} pins which must be connected to the same voltage. In the smaller packages, the V_{CCO} pins are connected between banks, effectively reducing the number of independent banks available (see Table 37). These interconnected banks are shown in the Pinout Tables with V_{CCO} pads for multiple banks connected to the same pin.

Table 37: **Independent VCCO Banks Available**

Package	VQ100 PQ208	CS144 TQ144	FG256 FG456
Independent Banks	1	4	8

Package Overview

Table 36 shows the six low-cost, space-saving production package styles for the Spartan-II family.

Each package style is available in an environmentally friendly lead-free (Pb-free) option. The Pb-free packages include an extra 'G' in the package style name. For example, the standard "CS144" package becomes "CSG144" when ordered as the Pb-free option. Leaded (non-Pb-free) packages may be available for selected devices, with the same pin-out and without the "G" in the ordering code; contact Xilinx sales for more information. The mechanical dimensions of the standard and Pb-free packages are similar, as shown in the mechanical drawings provided in Table 38.

For additional package information, see UG112: *Device Package User Guide*.

Mechanical Drawings

Detailed mechanical drawings for each package type are available from the Xilinx web site at the specified location in Table 38.

Material Declaration Data Sheets (MDDS) are also available on the Xilinx web site for each package.

Table 38: **Xilinx Package Documentation**

11/02/00

Revision History

Version No.	Date	Description
2.0	09/18/00	Sectioned the Spartan-II Family data sheet into four modules. Corrected all known errors in the pinout tables.
2.1	10/04/00	Added notes requiring $\overline{PWDN}$ to be tied to V_{CCINT} when unused.
2.2	11/02/00	Removed the Power Down feature.
2.3	03/05/01	Added notes on pinout tables for IRDY and TRDY.
2.4	04/30/01	Reinstated XC2S50 V_{CCO} Bank 7, GND, and "not connected" pins missing in version 2.3.
2.5	09/03/03	Added caution about Not Connected Pins to XC2S30 pinout tables on page 76.
2.8	06/13/08	Added "Package Overview" section. Added notes to clarify shared V_{CCO} banks. Updated description and links. Updated all modules for continuous page, figure, and table numbering. Synchronized all modules to v2.8.
