Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Active
Number of LABs/CLBs	96
Number of Logic Elements/Cells	432
Total RAM Bits	16384
Number of I/O	60
Number of Gates	15000
Voltage - Supply	2.375V ~ 2.625V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	100-TQFP
Supplier Device Package	100-VQFP (14x14)
Purchase URL	https://www.e-xfl.com/product-detail/xilinx/xc2s15-5vq100i

Spartan-II FPGA Family: Introduction and Ordering Information

DS001-1 (v2.8) June 13, 2008

Product Specification

Introduction

The Spartan®-II Field-Programmable Gate Array family gives users high performance, abundant logic resources, and a rich feature set, all at an exceptionally low price. The six-member family offers densities ranging from 15,000 to 200,000 system gates, as shown in Table 1. System performance is supported up to 200 MHz. Features include block RAM (to 56K bits), distributed RAM (to 75,264 bits), 16 selectable I/O standards, and four DLLs. Fast, predictable interconnect means that successive design iterations continue to meet timing requirements.

The Spartan-II family is a superior alternative to mask-programmed ASICs. The FPGA avoids the initial cost, lengthy development cycles, and inherent risk of conventional ASICs. Also, FPGA programmability permits design upgrades in the field with no hardware replacement necessary (impossible with ASICs).

Features

- Second generation ASIC replacement technology
  - Densities as high as 5,292 logic cells with up to 200,000 system gates
  - Streamlined features based on Virtex® FPGA architecture
  - Unlimited reprogrammability
  - Very low cost
  - Cost-effective 0.18 micron process
- System level features
  - SelectRAM™ hierarchical memory:
    - 16 bits/LUT distributed RAM
    - Configurable 4K bit block RAM
    - Fast interfaces to external RAM
  - Fully PCI compliant
  - Low-power segmented routing architecture
  - Full readback ability for verification/observability
  - Dedicated carry logic for high-speed arithmetic
  - Efficient multiplier support
  - Cascade chain for wide-input functions
  - Abundant registers/latches with enable, set, reset
  - Four dedicated DLLs for advanced clock control
  - Four primary low-skew global clock distribution nets
  - IEEE 1149.1 compatible boundary scan logic
- Versatile I/O and packaging
  - Pb-free package options
  - Low-cost packages available in all densities
  - Family footprint compatibility in common packages
  - 16 high-performance interface standards
  - Hot swap Compact PCI friendly
  - Zero hold time simplifies system timing
- Core logic powered at 2.5V and I/Os powered at 1.5V, 2.5V, or 3.3V
- Fully supported by powerful Xilinx® ISE® development system
  - Fully automatic mapping, placement, and routing

Table 1: **Spartan-II FPGA Family Members**

Device	Logic Cells	System Gates (Logic and RAM)	CLB Array (R x C)	Total CLBs	Maximum Available User I/O(1)	Total Distributed RAM Bits	Total Block RAM Bits
XC2S15	432	15,000	8 x 12	96	86	6,144	16K
XC2S30	972	30,000	12 x 18	216	92	13,824	24K
XC2S50	1,728	50,000	16 x 24	384	176	24,576	32K
XC2S100	2,700	100,000	20 x 30	600	176	38,400	40K
XC2S150	3,888	150,000	24 x 36	864	260	55,296	48K
XC2S200	5,292	200,000	28 x 42	1,176	284	75,264	56K

Notes:

1. All user I/O counts do not include the four global clock/user input pins. See details in Table 2, page 4.

General Overview

The Spartan-II family of FPGAs have a regular, flexible, programmable architecture of Configurable Logic Blocks (CLBs), surrounded by a perimeter of programmable Input/Output Blocks (IOBs). There are four Delay-Locked Loops (DLLs), one at each corner of the die. Two columns of block RAM lie on opposite sides of the die, between the CLBs and the IOB columns. These functional elements are interconnected by a powerful hierarchy of versatile routing channels (see Figure 1).

Spartan-II FPGAs are customized by loading configuration data into internal static memory cells. Unlimited reprogramming cycles are possible with this approach. Stored values in these cells determine logic functions and interconnections implemented in the FPGA. Configuration data can be read from an external serial PROM (master serial mode), or written into the FPGA in slave serial, slave parallel, or Boundary Scan modes.

Spartan-II FPGAs are typically used in high-volume applications where the versatility of a fast programmable solution adds benefits. Spartan-II FPGAs are ideal for shortening product development cycles while offering a cost-effective solution for high volume production.

Spartan-II FPGAs achieve high-performance, low-cost operation through advanced architecture and semiconductor technology. Spartan-II devices provide system clock rates up to 200 MHz. In addition to the conventional benefits of high-volume programmable logic solutions, Spartan-II FPGAs also offer on-chip synchronous single-port and dual-port RAM (block and distributed form), DLL clock drivers, programmable set and reset on all flip-flops, fast carry logic, and many other features.

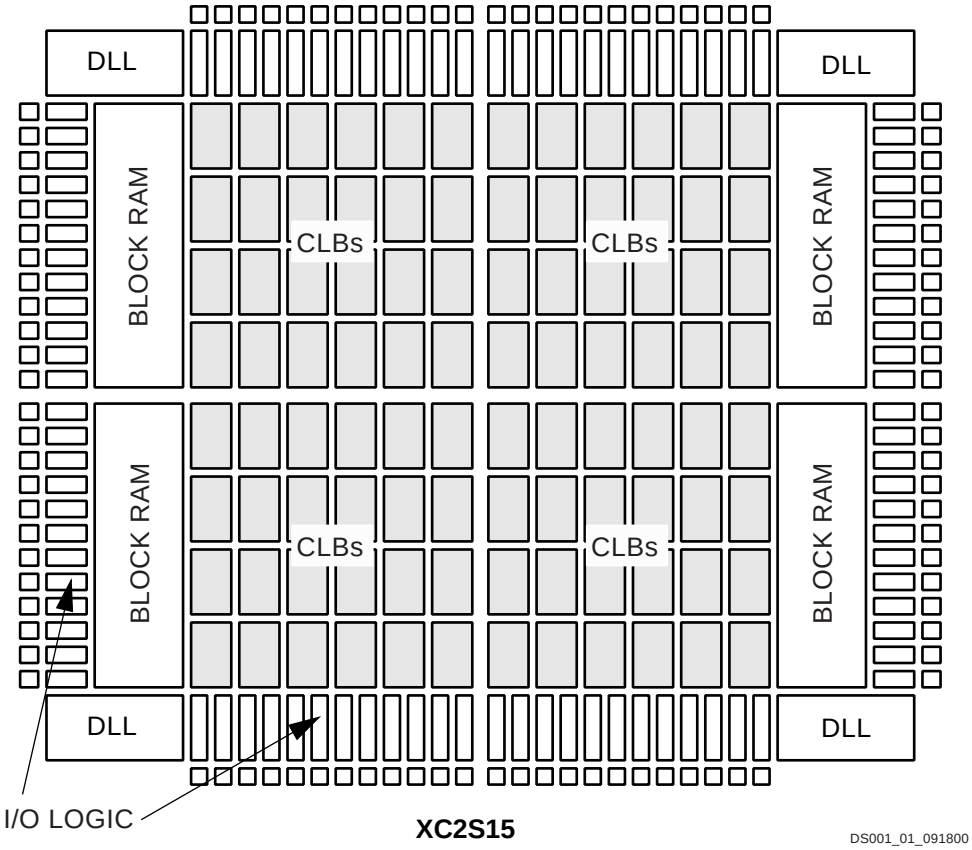

Figure 1: **Basic Spartan-II Family FPGA Block Diagram**

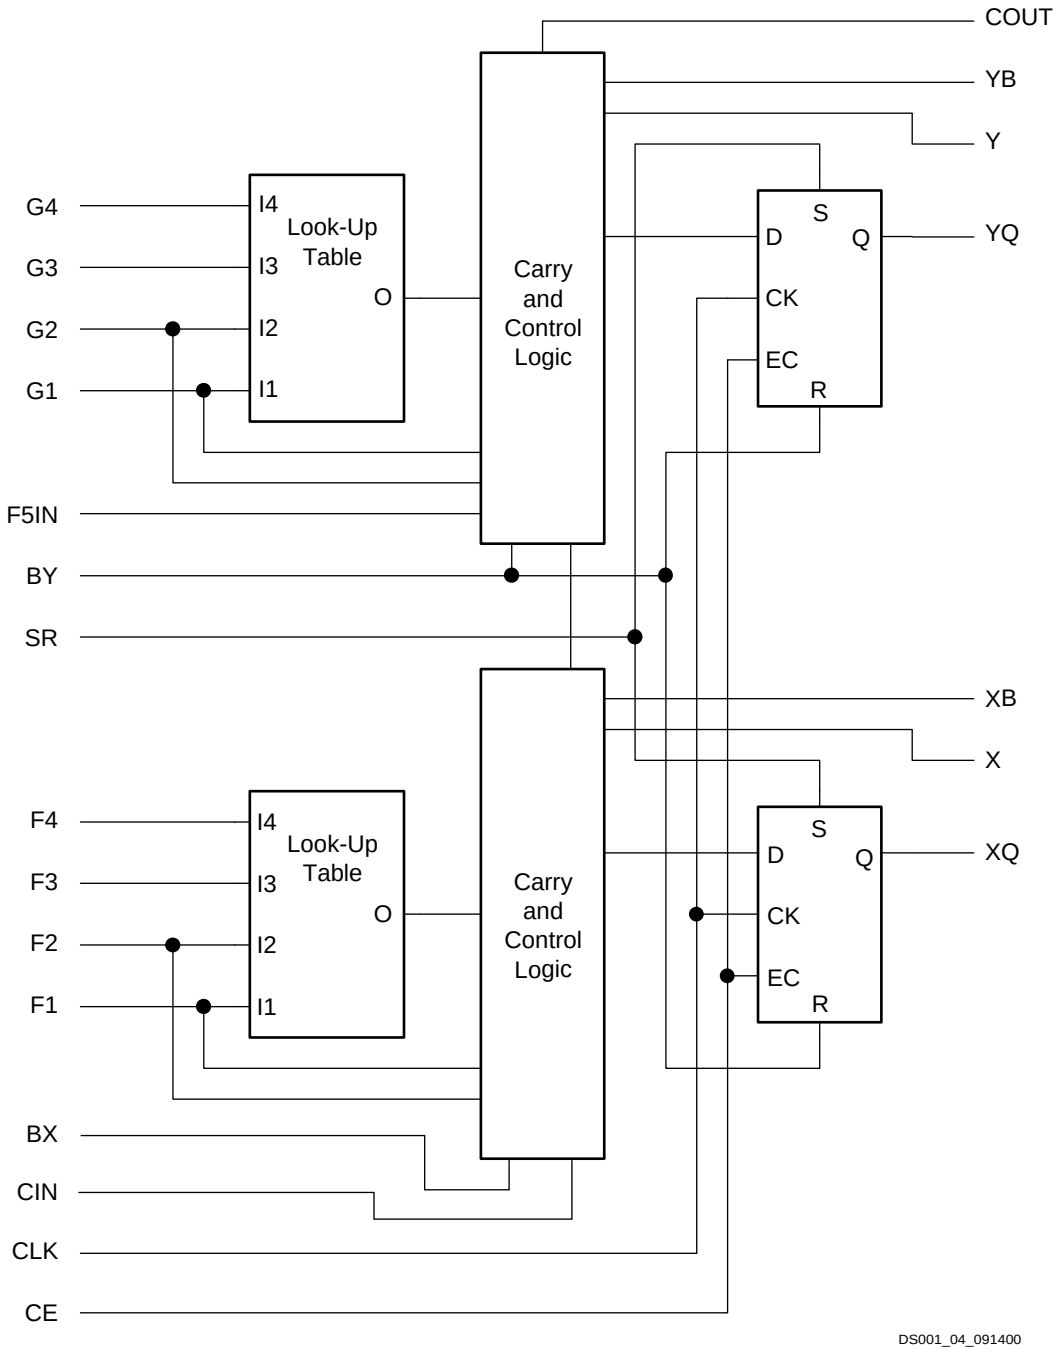

Figure 4: **Spartan-II CLB Slice** (two identical slices in each CLB)

Storage Elements

Storage elements in the Spartan-II FPGA slice can be configured either as edge-triggered D-type flip-flops or as level-sensitive latches. The D inputs can be driven either by function generators within the slice or directly from slice inputs, bypassing the function generators.

In addition to Clock and Clock Enable signals, each slice has synchronous set and reset signals (SR and BY). SR forces a storage element into the initialization state specified for it in the configuration. BY forces it into the opposite state. Alternatively, these signals may be configured to operate asynchronously.

All control signals are independently invertible, and are shared by the two flip-flops within the slice.

Additional Logic

The F5 multiplexer in each slice combines the function generator outputs. This combination provides either a function generator that can implement any 5-input function, a 4:1 multiplexer, or selected functions of up to nine inputs.

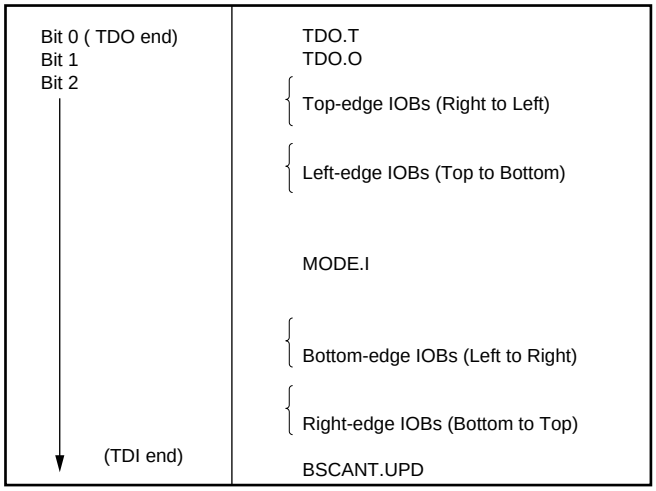

Figure 10: **Boundary Scan Bit Sequence**

Development System

Spartan-II FPGAs are supported by the Xilinx ISE® development tools. The basic methodology for Spartan-II FPGA design consists of three interrelated steps: design entry, implementation, and verification. Industry-standard tools are used for design entry and simulation, while Xilinx provides proprietary architecture-specific tools for implementation.

The Xilinx development system is integrated under a single graphical interface, providing designers with a common user interface regardless of their choice of entry and verification tools. The software simplifies the selection of implementation options with pull-down menus and on-line help.

For HDL design entry, the Xilinx FPGA development system provides interfaces to several synthesis design environments.

A standard interface-file specification, Electronic Design Interchange Format (EDIF), simplifies file transfers into and out of the development system.

Spartan-II FPGAs supported by a unified library of standard functions. This library contains over 400 primitives and macros, ranging from 2-input AND gates to 16-bit accumulators, and includes arithmetic functions, comparators, counters, data registers, decoders, encoders, I/O functions, latches, Boolean functions, multiplexers, shift registers, and barrel shifters.

The design environment supports hierarchical design entry. These hierarchical design elements are automatically combined by the implementation tools. Different design entry tools can be combined within a hierarchical design, thus allowing the most convenient entry method to be used for each portion of the design.

Design Implementation

The place-and-route tools (PAR) automatically provide the implementation flow described in this section. The partitioner takes the EDIF netlist for the design and maps the logic into the architectural resources of the FPGA (CLBs and IOBs, for example). The placer then determines the best locations for these blocks based on their interconnections and the desired performance. Finally, the router interconnects the blocks.

The PAR algorithms support fully automatic implementation of most designs. For demanding applications, however, the user can exercise various degrees of control over the process. User partitioning, placement, and routing information is optionally specified during the design-entry process. The implementation of highly structured designs can benefit greatly from basic floorplanning.

The implementation software incorporates timing-driven placement and routing. Designers specify timing requirements along entire paths during design entry. The timing path analysis routines in PAR then recognize these user-specified requirements and accommodate them.

Timing requirements are entered in a form directly relating to the system requirements, such as the targeted clock frequency, or the maximum allowable delay between two registers. In this way, the overall performance of the system along entire signal paths is automatically tailored to user-generated specifications. Specific timing information for individual nets is unnecessary.

Design Verification

In addition to conventional software simulation, FPGA users can use in-circuit debugging techniques. Because Xilinx devices are infinitely reprogrammable, designs can be verified in real time without the need for extensive sets of software simulation vectors.

The development system supports both software simulation and in-circuit debugging techniques. For simulation, the system extracts the post-layout timing information from the design database, and back-annotates this information into the netlist for use by the simulator. Alternatively, the user can verify timing-critical portions of the design using the static timing analyzer.

For in-circuit debugging, the development system includes a download cable, which connects the FPGA in the target system to a PC or workstation. After downloading the design into the FPGA, the designer can read back the contents of the flip-flops, and so observe the internal logic state. Simple modifications can be downloaded into the system in a matter of minutes.

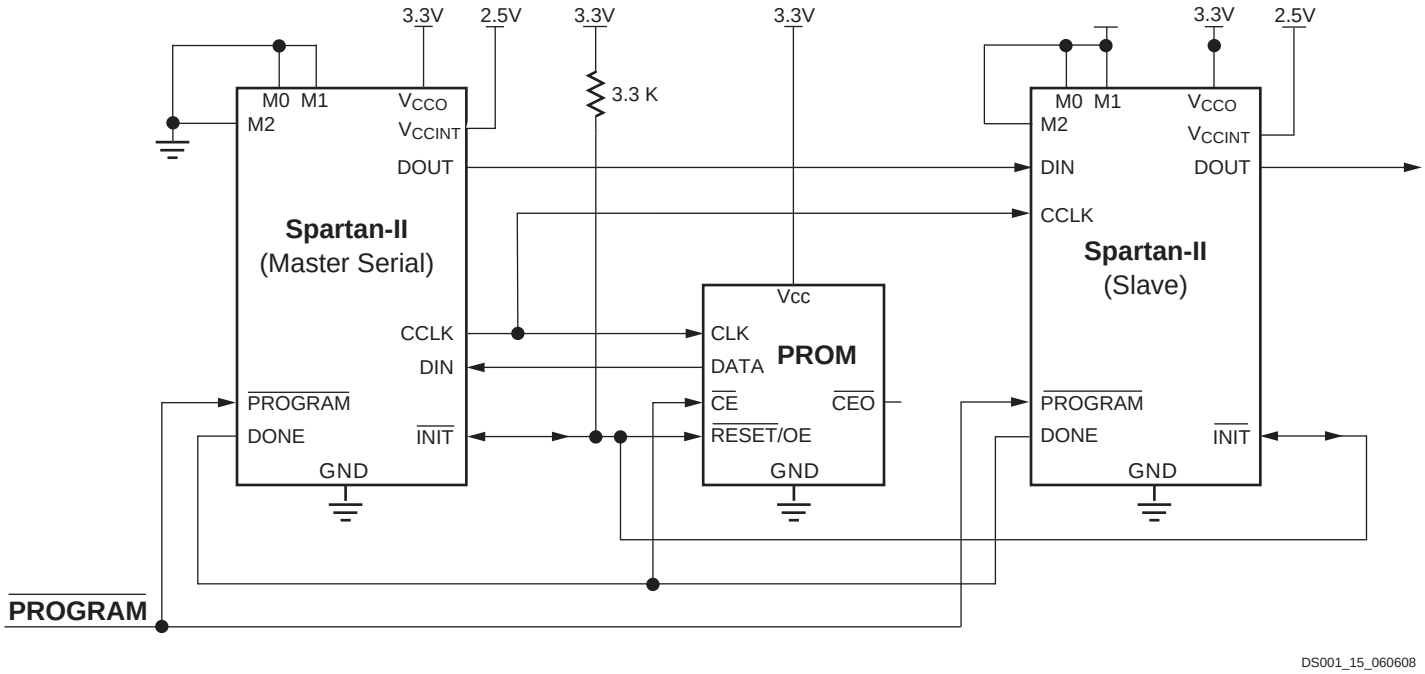
Slave Serial Mode

In Slave Serial mode, the FPGA's CCLK pin is driven by an external source, allowing FPGAs to be configured from other logic devices such as microprocessors or in a daisy-chain configuration. Figure 15 shows connections for a Master Serial FPGA configuring a Slave Serial FPGA from a PROM. A Spartan-II device in slave serial mode should be connected as shown for the third device from the left. Slave Serial mode is selected by a <11x> on the mode pins (M0, M1, M2).

Figure 16 shows the timing for Slave Serial configuration. The serial bitstream must be setup at the DIN input pin a short time before each rising edge of an externally generated CCLK.

Multiple FPGAs in Slave Serial mode can be daisy-chained for configuration from a single source. The maximum amount of data that can be sent to the DOUT pin for a serial daisy chain is 2^{20}-1 (1,048,575) 32-bit words, or 33,554,400 bits, which is approximately 25 XC2S200 bitstreams. The configuration bitstream of downstream devices is limited to this size.

After an FPGA is configured, data for the next device is routed to the DOUT pin. Data on the DOUT pin changes on the rising edge of CCLK. Configuration must be delayed until $\overline{\text{INIT}}$ pins of all daisy-chained FPGAs are High. For more information, see "Start-up," page 19.



Notes:
1. If the DriveDone configuration option is not active for any of the FPGAs, pull up DONE with a 330Ω resistor.

Figure 15: **Master/Slave Serial Configuration Circuit Diagram**

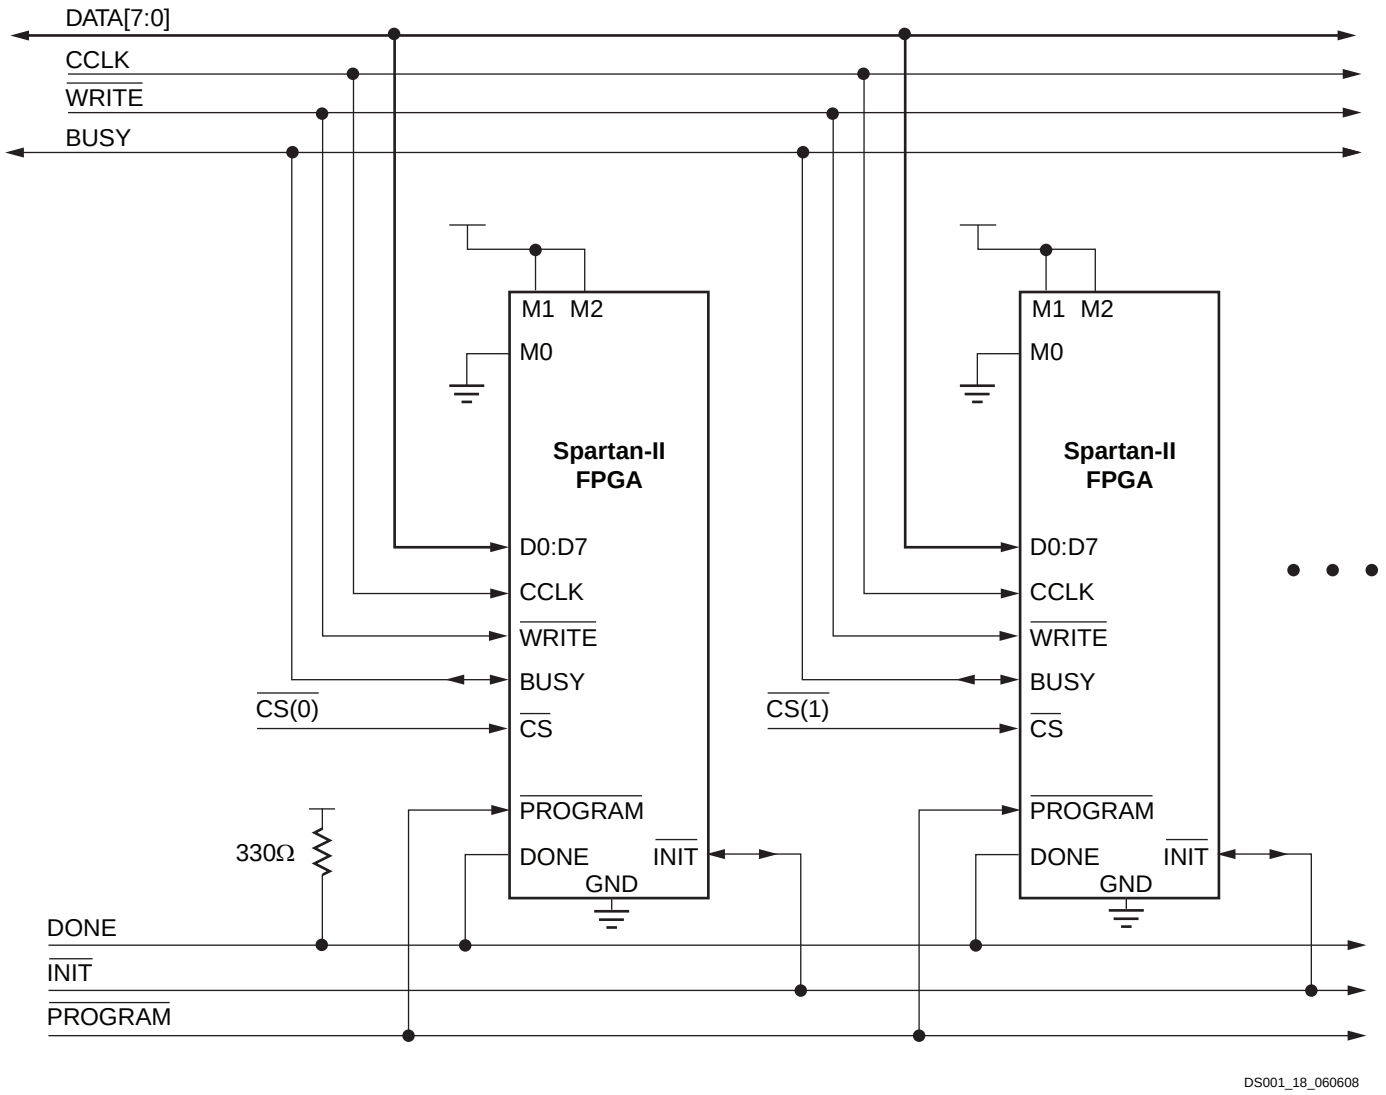


Figure 18: **Slave Parallel Configuration Circuit Diagram**

Multiple Spartan-II FPGAs can be configured using the Slave Parallel mode, and be made to start-up simultaneously. To configure multiple devices in this way, wire the individual CCLK, Data, $\overline{\text{WRITE}}$, and BUSY pins of all the devices in parallel. The individual devices are loaded separately by asserting the $\overline{\text{CS}}$ pin of each device in turn and writing the appropriate data. Sync-to-DONE start-up timing is used to ensure that the start-up sequence does not begin until all the FPGAs have been loaded. See "Start-up," page 19.

Write

When using the Slave Parallel Mode, write operations send packets of byte-wide configuration data into the FPGA. Figure 19, page 25 shows a flowchart of the write sequence used to load data into the Spartan-II FPGA. This is an expansion of the "Load Configuration Data Frames" block in Figure 11, page 18. The timing for write operations is shown in Figure 20, page 26.

For the present example, the user holds $\overline{\text{WRITE}}$ and $\overline{\text{CS}}$ Low throughout the sequence of write operations. Note that when $\overline{\text{CS}}$ is asserted on successive CCLKs, $\overline{\text{WRITE}}$ must remain either asserted or de-asserted. Otherwise an abort will be initiated, as in the next section.

1. Drive data onto D0-D7. Note that to avoid contention, the data source should not be enabled while $\overline{\text{CS}}$ is Low and $\overline{\text{WRITE}}$ is High. Similarly, while $\overline{\text{WRITE}}$ is High, no more than one device's $\overline{\text{CS}}$ should be asserted.
2. On the rising edge of CCLK: If BUSY is Low, the data is accepted on this clock. If BUSY is High (from a previous write), the data is not accepted. Acceptance will instead occur on the first clock after BUSY goes Low, and the data must be held until this happens.
3. Repeat steps 1 and 2 until all the data has been sent.
4. De-assert $\overline{\text{CS}}$ and $\overline{\text{WRITE}}$.

division factor N except for non-integer division in High Frequency (HF) mode. For division factor 1.5 the duty cycle in the HF mode is 33.3% High and 66.7% Low. For division factor 2.5, the duty cycle in the HF mode is 40.0% High and 60.0% Low.

1x Clock Outputs — CLK[0|90|180|270]

The 1x clock output pin CLK0 represents a delay-compensated version of the source clock (CLKIN) signal. The CLKDLL primitive provides three phase-shifted versions of the CLK0 signal while CLKDLLHF provides only the 180 degree phase-shifted version. The relationship between phase shift and the corresponding period shift appears in Table 10.

The timing diagrams in Figure 26 illustrate the DLL clock output characteristics.

Table 10: **Relationship of Phase-Shifted Output Clock to Period Shift**

Phase (degrees)	Period Shift (percent)
0	0%
90	25%
180	50%
270	75%

The DLL provides duty cycle correction on all 1x clock outputs such that all 1x clock outputs by default have a 50/50 duty cycle. The DUTY_CYCLE_CORRECTION property (TRUE by default), controls this feature. In order to deactivate the DLL duty cycle correction, attach the DUTY_CYCLE_CORRECTION=FALSE property to the DLL primitive. When duty cycle correction deactivates, the output clock has the same duty cycle as the source clock.

The DLL clock outputs can drive an OBUF, a BUFG, or they can route directly to destination clock pins. The DLL clock outputs can only drive the BUFGs that reside on the same edge (top or bottom).

Locked Output — LOCKED

In order to achieve lock, the DLL may need to sample several thousand clock cycles. After the DLL achieves lock the LOCKED signal activates. The "DLL Timing Parameters" section of Module 3 provides estimates for locking times.

In order to guarantee that the system clock is established prior to the device "waking up," the DLL can delay the completion of the device configuration process until after the DLL locks. The STARTUP_WAIT property activates this feature.

Until the LOCKED signal activates, the DLL output clocks are not valid and can exhibit glitches, spikes, or other spurious movement. In particular the CLK2X output will appear as a 1x clock with a 25/75 duty cycle.

DLL Properties

Properties provide access to some of the Spartan-II family DLL features, (for example, clock division and duty cycle correction).

Duty Cycle Correction Property

The 1x clock outputs, CLK0, CLK90, CLK180, and CLK270, use the duty-cycle corrected default, such that they exhibit a 50/50 duty cycle. The DUTY_CYCLE_CORRECTION property (by default TRUE) controls this feature. To deactivate the DLL duty-cycle correction for the 1x clock outputs, attach the DUTY_CYCLE_CORRECTION=FALSE property to the DLL primitive.

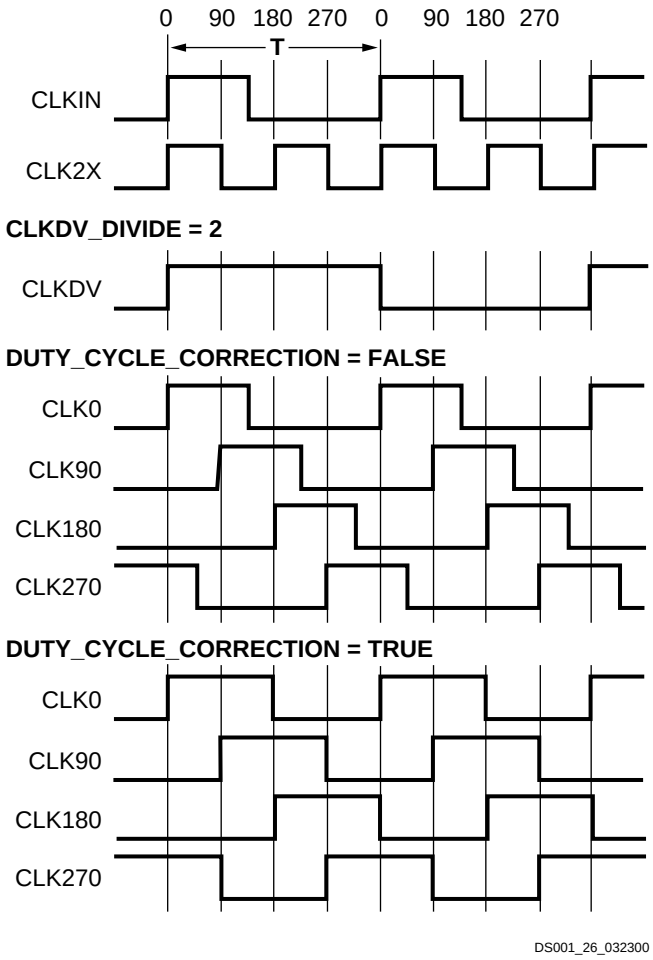

Figure 26: **DLL Output Characteristics**

Clock Divide Property

The CLKDV_DIVIDE property specifies how the signal on the CLKDV pin is frequency divided with respect to the CLK0 pin. The values allowed for this property are 1.5, 2, 2.5, 3, 4, 5, 8, or 16; the default value is 2.

Using Block RAM Features

The Spartan-II FPGA family provides dedicated blocks of on-chip, true dual-read/write port synchronous RAM, with 4096 memory cells. Each port of the block RAM memory can be independently configured as a read/write port, a read port, a write port, and can be configured to a specific data width. The block RAM memory offers new capabilities allowing the FPGA designer to simplify designs.

Operating Modes

Block RAM memory supports two operating modes.

- Read Through
- Write Back

Read Through (One Clock Edge)

The read address is registered on the read port clock edge and data appears on the output after the RAM access time. Some memories may place the latch/register at the outputs depending on the desire to have a faster clock-to-out versus setup time. This is generally considered to be an inferior solution since it changes the read operation to an asynchronous function with the possibility of missing an address/control line transition during the generation of the read pulse clock.

Write Back (One Clock Edge)

The write address is registered on the write port clock edge and the data input is written to the memory and mirrored on the write port input.

Block RAM Characteristics

1. All inputs are registered with the port clock and have a setup to clock timing specification.
2. All outputs have a read through or write back function depending on the state of the port WE pin. The outputs relative to the port clock are available after the clock-to-out timing specification.
3. The block RAM are true SRAM memories and do not have a combinatorial path from the address to the output. The LUT cells in the CLBs are still available with this function.
4. The ports are completely independent from each other (*i.e.,* clocking, control, address, read/write function, and data width) without arbitration.
5. A write operation requires only one clock edge.
6. A read operation requires only one clock edge.

The output ports are latched with a self timed circuit to guarantee a glitch free read. The state of the output port will not change until the port executes another read or write operation.

Library Primitives

Figure 31 and Figure 32 show the two generic library block RAM primitives. Table 11 describes all of the available primitives for synthesis and simulation.

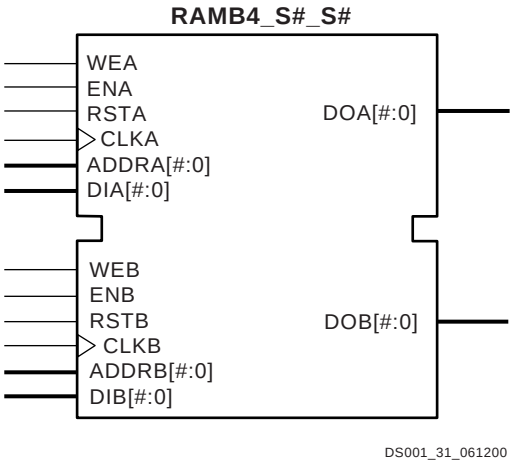

Figure 31: **Dual-Port Block RAM Memory**

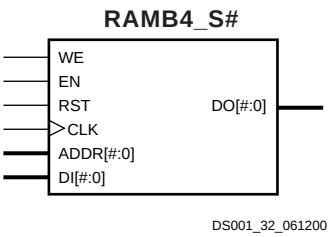

Figure 32: **Single-Port Block RAM Memory**

Table 11: **Available Library Primitives**

Primitive	Port A Width	Port B Width
RAMB4_S1	1	N/A
RAMB4_S1_S1		1
RAMB4_S1_S2		2
RAMB4_S1_S4		4
RAMB4_S1_S8		8
RAMB4_S1_S16		16
RAMB4_S2	2	N/A
RAMB4_S2_S2		2
RAMB4_S2_S4		4
RAMB4_S2_S8		8
RAMB4_S2_S16		16

LVTTL output buffers have selectable drive strengths.

The format for LVTTL OBUF primitive names is as follows.

OBUF_<slew_rate>_<drive_strength>

<slew_rate> is either F (Fast), or S (Slow) and <drive_strength> is specified in milliamps (2, 4, 6, 8, 12, 16, or 24). The default is slew rate limited with 12 mA drive.

OBUF placement restrictions require that within a given V_{CCO} bank each OBUF share the same output source drive voltage. Input buffers of any type and output buffers that do not require V_{CCO} can be placed within any V_{CCO} bank. Table 17 summarizes the output compatibility requirements. The LOC property can specify a location for the OBUF.

Table 17: **Output Standards Compatibility Requirements**

Rule 1	Only outputs with standards which share compatible V_{CCO} may be used within the same bank.
Rule 2	There are no placement restrictions for outputs with standards that do not require a V_{CCO}.
V_{CCO}	Compatible Standards
3.3	LVTTL, SSTL3_I, SSTL3_II, CTT, AGP, GTL, GTL+, PCI33_3, PCI66_3
2.5	SSTL2_I, SSTL2_II, LVCMOS2, GTL, GTL+
1.5	HSTL_I, HSTL_III, HSTL_IV, GTL, GTL+

OBUFT

The generic 3-state output buffer OBUFT, shown in Figure 39, typically implements 3-state outputs or bidirectional I/O.

With no extension or property specified for the generic OBUFT primitive, the assumed standard is slew rate limited LVTTL with 12 mA drive strength.

The LVTTL OBUFT can support one of two slew rate modes to minimize bus transients. By default, the slew rate for each output buffer is reduced to minimize power bus transients when switching non-critical signals.

LVTTL 3-state output buffers have selectable drive strengths.

The format for LVTTL OBUFT primitive names is as follows.

OBUFT_<slew_rate>_<drive_strength>

<slew_rate> can be either F (Fast), or S (Slow) and <drive_strength> is specified in milliamps (2, 4, 6, 8, 12, 16, or 24).

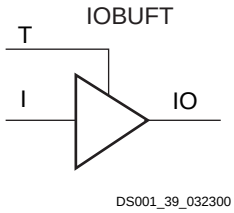

Figure 39: **3-State Output Buffer Primitive (OBUFT**

The Versatile I/O OBUFT placement restrictions require that within a given V_{CCO} bank each OBUFT share the same output source drive voltage. Input buffers of any type and output buffers that do not require V_{CCO} can be placed within the same V_{CCO} bank.

The LOC property can specify a location for the OBUFT.

3-state output buffers and bidirectional buffers can have either a weak pull-up resistor, a weak pull-down resistor, or a weak "keeper" circuit. Control this feature by adding the appropriate primitive to the output net of the OBUFT (PULLUP, PULLDOWN, or KEEPER).

The weak "keeper" circuit requires the input buffer within the IOB to sample the I/O signal. So, OBUFTs programmed for an I/O standard that requires a V_{REF} have automatic placement of a V_{REF} in the bank with an OBUFT configured with a weak "keeper" circuit. This restriction does not affect most circuit design as applications using an OBUFT configured with a weak "keeper" typically implement a bidirectional I/O. In this case the IBUF (and the corresponding V_{REF}) are explicitly placed.

The LOC property can specify a location for the OBUFT.

IOBUF

Use the IOBUF primitive for bidirectional signals that require both an input buffer and a 3-state output buffer with an active high 3-state pin. The generic input/output buffer IOBUF appears in Figure 40.

With no extension or property specified for the generic IOBUF primitive, the assumed standard is LVTTL input buffer and slew rate limited LVTTL with 12 mA drive strength for the output buffer.

The LVTTL IOBUF can support one of two slew rate modes to minimize bus transients. By default, the slew rate for each output buffer is reduced to minimize power bus transients when switching non-critical signals.

LVTTL bidirectional buffers have selectable output drive strengths.

The format for LVTTL IOBUF primitive names is as follows:

IOBUF_<slew_rate>_<drive_strength>

<slew_rate> can be either F (Fast), or S (Slow) and <drive_strength> is specified in milliamps (2, 4, 6, 8, 12, 16, or 24).

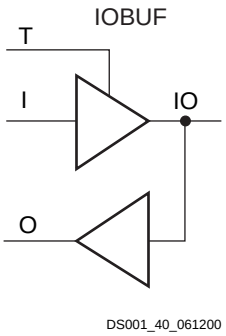

Figure 40: **Input/Output Buffer Primitiveprimitive (IOBUF)**

When the IOBUF primitive supports an I/O standard such as LVTTL, LVCMOS, or PCI33_5, the IBUF automatically configures as a 5V tolerant input buffer unless the V_{CCO} for the bank is less than 2V. If the single-ended IBUF is placed in a bank with an HSTL standard (V_{CCO} < 2V), the input buffer is not 5V tolerant.

The voltage reference signal is "banked" within the Spartan-II device on a half-edge basis such that for all packages there are eight independent V_{REF} banks internally. See Figure 36, page 39 for a representation of the Spartan-II FPGA I/O banks. Within each bank approximately one of every six I/O pins is automatically configured as a V_{REF} input.

Additional restrictions on the Versatile I/O IOBUF placement require that within a given V_{CCO} bank each IOBUF must share the same output source drive voltage. Input buffers of any type and output buffers that do not require V_{CCO} can be placed within the same V_{CCO} bank. The LOC property can specify a location for the IOBUF.

An optional delay element is associated with the input path in each IOBUF. When the IOBUF drives an input flip-flop within the IOB, the delay element activates by default to ensure a zero hold-time requirement. Override this default with the NODELAY=TRUE property.

In the case when the IOBUF does not drive an input flip-flop within the IOB, the delay element de-activates by default to provide higher performance. To delay the input signal, activate the delay element with the DELAY=TRUE property.

3-state output buffers and bidirectional buffers can have either a weak pull-up resistor, a weak pull-down resistor, or a weak "keeper" circuit. Control this feature by adding the appropriate primitive to the output net of the IOBUF (PULLUP, PULLDOWN, or KEEPER).

Versatile I/O Properties

Access to some of the Versatile I/O features (for example, location constraints, input delay, output drive strength, and slew rate) is available through properties associated with these features.

Input Delay Properties

An optional delay element is associated with each IBUF. When the IBUF drives a flip-flop within the IOB, the delay element activates by default to ensure a zero hold-time requirement. Use the NODELAY=TRUE property to override this default.

In the case when the IBUF does not drive a flip-flop within the IOB, the delay element by default de-activates to provide higher performance. To delay the input signal, activate the delay element with the DELAY=TRUE property.

IOB Flip-Flop/Latch Property

The I/O Block (IOB) includes an optional register on the input path, an optional register on the output path, and an optional register on the 3-state control pin. The design implementation software automatically takes advantage of these registers when the following option for the Map program is specified:

map -pr b <filename>

Alternatively, the IOB = TRUE property can be placed on a register to force the mapper to place the register in an IOB.

Location Constraints

Specify the location of each Versatile I/O primitive with the location constraint LOC attached to the Versatile I/O primitive. The external port identifier indicates the value of the location constrain. The format of the port identifier depends on the package chosen for the specific design.

The LOC properties use the following form:

LOC=A42

LOC=P37

Output Slew Rate Property

In the case of the LVTTL output buffers (OBUF, OBUFT, and IOBUF), slew rate control can be programmed with the SLEW= property. By default, the slew rate for each output buffer is reduced to minimize power bus transients when switching non-critical signals. The SLEW= property has one of the two following values.

SLEW=SLOW

SLEW=FAST

Output Drive Strength Property

For the LVTTL output buffers (OBUF, OBUFT, and IOBUF, the desired drive strength can be specified with the DRIVE=

SSTL3 Class I

A sample circuit illustrating a valid termination technique for SSTL3_I appears in Figure 47. DC voltage specifications appear in Table 25 for the SSTL3_I standard. See "DC Specifications" in Module 3 for the actual FPGA characteristics.

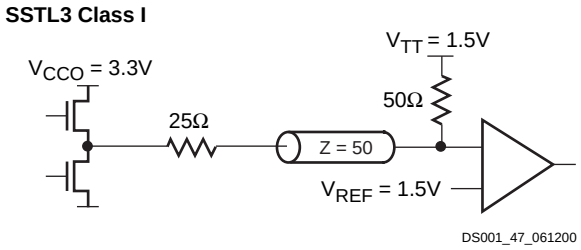

Figure 47: **Terminated SSTL3 Class I**

Table 25: **SSTL3_I Voltage Specifications**

Parameter	Min	Typ	Max
V_{CCO}	3.0	3.3	3.6
$V_{REF} = 0.45 \times V_{CCO}$	1.3	1.5	1.7
$V_{TT} = V_{REF}$	1.3	1.5	1.7
$V_{IH} \geq V_{REF} + 0.2$	1.5	1.7	3.9(1)
$V_{IL} \leq V_{REF} - 0.2$	–0.3(2)	1.3	1.5
$V_{OH} \geq V_{REF} + 0.6$	1.9	-	-
$V_{OL} \leq V_{REF} - 0.6$	-	-	1.1
I_{OH} at V_{OH} (mA)	–8	-	-
I_{OL} at V_{OL} (mA)	8	-	-

Notes:
1. V_{IH} maximum is V_{CCO} + 0.3.
2. V_{IL} minimum does not conform to the formula.

SSTL3 Class II

A sample circuit illustrating a valid termination technique for SSTL3_II appears in Figure 48. DC voltage specifications appear in Table 26 for the SSTL3_II standard. See "DC Specifications" in Module 3 for the actual FPGA characteristics.

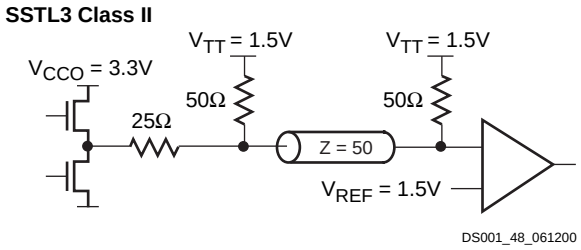

Figure 48: **Terminated SSTL3 Class II**

Table 26: **SSTL3_II Voltage Specifications**

Parameter	Min	Typ	Max
V_{CCO}	3.0	3.3	3.6
$V_{REF} = 0.45 \times V_{CCO}$	1.3	1.5	1.7
$V_{TT} = V_{REF}$	1.3	1.5	1.7
$V_{IH} \geq V_{REF} + 0.2$	1.5	1.7	3.9(1)
$V_{IL} \leq V_{REF} - 0.2$	–0.3(2)	1.3	1.5
$V_{OH} \geq V_{REF} + 0.8$	2.1	-	-
$V_{OL} \leq V_{REF} - 0.8$	-	-	0.9
I_{OH} at V_{OH} (mA)	–16	-	-
I_{OL} at V_{OL} (mA)	16	-	-

Notes:
1. V_{IH} maximum is V_{CCO} + 0.3
2. V_{IL} minimum does not conform to the formula

SSTL2_I

A sample circuit illustrating a valid termination technique for SSTL2_I appears in Figure 49. DC voltage specifications appear in Table 27 for the SSTL2_I standard. See "DC Specifications" in Module 3 for the actual FPGA characteristics

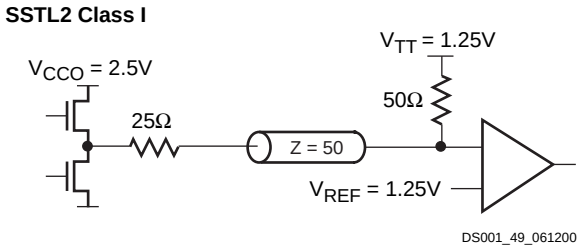

Figure 49: **Terminated SSTL2 Class I**

Table 27: **SSTL2_I Voltage Specifications**

Parameter	Min	Typ	Max
V_{CCO}	2.3	2.5	2.7
$V_{REF} = 0.5 \times V_{CCO}$	1.15	1.25	1.35
$V_{TT} = V_{REF} + N^{(1)}$	1.11	1.25	1.39
$V_{IH} \geq V_{REF} + 0.18$	1.33	1.43	$3.0^{(2)}$
$V_{IL} \leq V_{REF} - 0.18$	$-0.3^{(3)}$	1.07	1.17
$V_{OH} \geq V_{REF} + 0.61$	1.76	-	-
$V_{OL} \leq V_{REF} - 0.61$	-	-	0.74
I_{OH} at V_{OH} (mA)	–7.6	-	-
I_{OL} at V_{OL} (mA)	7.6	-	-

Notes:
1. N must be greater than or equal to –0.04 and less than or equal to 0.04.
2. V_{IH} maximum is V_{CCO} + 0.3.
3. V_{IL} minimum does not conform to the formula.

SSTL2 Class II

A sample circuit illustrating a valid termination technique for SSTL2_II appears in Figure 50. DC voltage specifications appear in Table 28 for the SSTL2_II standard. See "DC Specifications" in Module 3 for the actual FPGA characteristics.

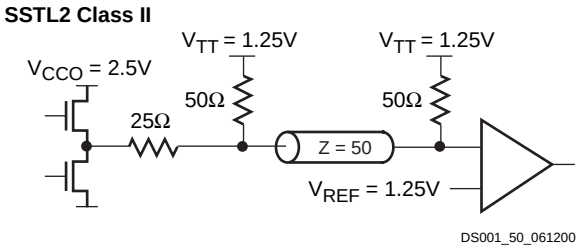

Figure 50: **Terminated SSTL2 Class II**

Table 28: **SSTL2_II Voltage Specifications**

Parameter	Min	Typ	Max
V_{CCO}	2.3	2.5	2.7
$V_{REF} = 0.5 \times V_{CCO}$	1.15	1.25	1.35
$V_{TT} = V_{REF} + N^{(1)}$	1.11	1.25	1.39
$V_{IH} \geq V_{REF} + 0.18$	1.33	1.43	$3.0^{(2)}$
$V_{IL} \leq V_{REF} - 0.18$	$-0.3^{(3)}$	1.07	1.17
$V_{OH} \geq V_{REF} + 0.8$	1.95	-	-
$V_{OL} \leq V_{REF} - 0.8$	-	-	0.55
I_{OH} at V_{OH} (mA)	–15.2	-	-
I_{OL} at V_{OL} (mA)	15.2	-	-

Notes:
1. N must be greater than or equal to –0.04 and less than or equal to 0.04.
2. V_{IH} maximum is V_{CCO} + 0.3.
3. V_{IL} minimum does not conform to the formula.

LVTTL

LVTTL requires no termination. DC voltage specifications appears in Table 32 for the LVTTL standard. See "DC Specifications" in Module 3 for the actual FPGA characteristics.

Table 32: **LVTTL Voltage Specifications**

Parameter	Min	Typ	Max
V_{CCO}	3.0	3.3	3.6
V_{REF}	-	-	-
V_{TT}	-	-	-
V_{IH}	2.0	-	5.5
V_{IL}	–0.5	-	0.8
V_{OH}	2.4	-	-
V_{OL}	-	-	0.4
I_{OH} at V_{OH} (mA)	–24	-	-
I_{OL} at V_{OL} (mA)	24	-	-

Notes:
1. V_{OL} and V_{OH} for lower drive currents sample tested.

LVCMOS2

LVCMOS2 requires no termination. DC voltage specifications appear in Table 33 for the LVCMOS2 standard. See "DC Specifications" in Module 3 for the actual FPGA characteristics.

Table 33: **LVCMOS2 Voltage Specifications**

Parameter	Min	Typ	Max
V_{CCO}	2.3	2.5	2.7
V_{REF}	-	-	-
V_{TT}	-	-	-
V_{IH}	1.7	-	5.5
V_{IL}	–0.5	-	0.7
V_{OH}	1.9	-	-
V_{OL}	-	-	0.4
I_{OH} at V_{OH} (mA)	–12	-	-
I_{OL} at V_{OL} (mA)	12	-	-

AGP-2X

The specification for the AGP-2X standard does not document a recommended termination technique. DC voltage specifications appear in Table 34 for the AGP-2X standard. See "DC Specifications" in Module 3 for the actual FPGA characteristics.

Table 34: **AGP-2X Voltage Specifications**

Parameter	Min	Typ	Max
V_{CCO}	3.0	3.3	3.6
$V_{REF} = N \times V_{CCO}$ (1)	1.17	1.32	1.48
V_{TT}	-	-	-
$V_{IH} \geq V_{REF} + 0.2$	1.37	1.52	-
$V_{IL} \leq V_{REF} - 0.2$	-	1.12	1.28
$V_{OH} \geq 0.9 \times V_{CCO}$	2.7	3.0	-
$V_{OL} \leq 0.1 \times V_{CCO}$	-	0.33	0.36
I_{OH} at V_{OH} (mA)	Note 2	-	-
I_{OL} at V_{OL} (mA)	Note 2	-	-

Notes:
1. N must be greater than or equal to 0.39 and less than or equal to 0.41.
2. Tested according to the relevant specification.

For design examples and more information on using the I/O, see XAPP179, *Using SelectIO Interfaces in Spartan-II and Spartan-IIE FPGAs*.

Power-On Requirements

Spartan-II FPGAs require that a minimum supply current I_{CCPO} be provided to the V_{CCINT} lines for a successful power-on. If more current is available, the FPGA can consume more than I_{CCPO} minimum, though this cannot adversely affect reliability.

A maximum limit for I_{CCPO} is not specified. Therefore the use of foldback/crowbar supplies and fuses deserves special attention. In these cases, limit the I_{CCPO} current to a level below the trip point for over-current protection in order to avoid inadvertently shutting down the supply.

Symbol	Description	Conditions		New Requirements(1) For Devices with Date Code 0321 or Later		Old Requirements(1) For Devices with Date Code before 0321		Units
		Junction Temperature(2)	Device Temperature Grade	Min	Max	Min	Max	
I_{CCPO}(3)	Total V_{CCINT} supply current required during power-on	–40°C ≤ T_J <–20°C	Industrial	1.50	-	2.00	-	A
		–20°C ≤ T_J < 0°C	Industrial	1.00	-	2.00	-	A
		0°C ≤ T_J ≤ 85°C	Commercial	0.25	-	0.50	-	A
		85°C < T_J ≤ 100°C	Industrial	0.50	-	0.50	-	A
T_{CCPO}(4,5)	V_{CCINT} ramp time	–40°C≤ T_J≤ 100°C	All	-	50	-	50	ms

Notes:

1. The date code is printed on the top of the device's package. See the "Device Part Marking" section in Module 1.
2. The expected T_J range for the design determines the I_{CCPO} minimum requirement. Use the applicable ranges in the junction temperature column to find the associated current values in the appropriate new or old requirements column according to the date code. Then choose the highest of these current values to serve as the minimum I_{CCPO} requirement that must be met. For example, if the junction temperature for a given design is -25°C ≤ T_J ≤ 75°C, then the new minimum I_{CCPO} requirement is 1.5A. If 5°C ≤ T_J ≤ 90°C, then the new minimum I_{CCPO} requirement is 0.5A.
3. The I_{CCPO} requirement applies for a brief time (commonly only a few milliseconds) when V_{CCINT} ramps from 0 to 2.5V.
4. The ramp time is measured from GND to V_{CCINT} max on a fully loaded board.
5. During power-on, the V_{CCINT} ramp must increase steadily in voltage with no dips.
6. For more information on designing to meet the power-on specifications, refer to the application note **XAPP450 "Power-On Current Requirements for the Spartan-II and Spartan-IIE Families"**

DC Input and Output Levels

Values for V_{IL} and V_{IH} are recommended input voltages. Values for V_{OL} and V_{OH} are guaranteed output voltages over the recommended operating conditions. Only selected standards are tested. These are chosen to ensure that all standards meet their specifications. The selected standards are tested at minimum V_{CCO} with the respective I_{OL} and I_{OH} currents shown. Other standards are sample tested.

Input/Output Standard	V_{IL}		V_{IH}		V_{OL}	V_{OH}	I_{OL}	I_{OH}
	V, Min	V, Max	V, Min	V, Max	V, Max	V, Min	mA	mA
LVTTL(1)	–0.5	0.8	2.0	5.5	0.4	2.4	24	–24
LVCMOS2	–0.5	0.7	1.7	5.5	0.4	1.9	12	–12
PCI, 3.3V	–0.5	44% V_{CCINT}	60% V_{CCINT}	V_{CCO} + 0.5	10% V_{CCO}	90% V_{CCO}	Note (2)	Note (2)
PCI, 5.0V	–0.5	0.8	2.0	5.5	0.55	2.4	Note (2)	Note (2)
GTL	–0.5	V_{REF} – 0.05	V_{REF} + 0.05	3.6	0.4	N/A	40	N/A
GTL+	–0.5	V_{REF} – 0.1	V_{REF} + 0.1	3.6	0.6	N/A	36	N/A
HSTL I	–0.5	V_{REF} – 0.1	V_{REF} + 0.1	3.6	0.4	V_{CCO} – 0.4	8	–8

11/02/00

Revision History

Version No.	Date	Description
2.0	09/18/00	Sectioned the Spartan-II Family data sheet into four modules. Corrected all known errors in the pinout tables.
2.1	10/04/00	Added notes requiring $\overline{PWDN}$ to be tied to V_{CCINT} when unused.
2.2	11/02/00	Removed the Power Down feature.
2.3	03/05/01	Added notes on pinout tables for IRDY and TRDY.
2.4	04/30/01	Reinstated XC2S50 V_{CCO} Bank 7, GND, and "not connected" pins missing in version 2.3.
2.5	09/03/03	Added caution about Not Connected Pins to XC2S30 pinout tables on page 76.
2.8	06/13/08	Added "Package Overview" section. Added notes to clarify shared V_{CCO} banks. Updated description and links. Updated all modules for continuous page, figure, and table numbering. Synchronized all modules to v2.8.
