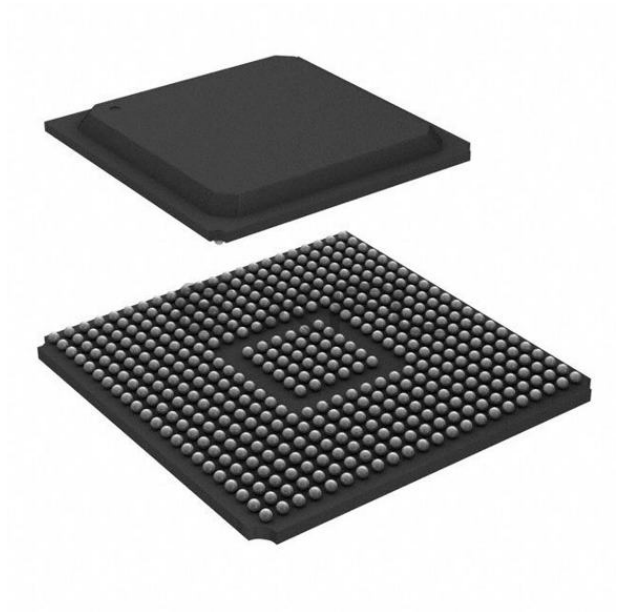
AMD Xilinx - XC2S150-5FG456C Datasheet



Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Active
Number of LABs/CLBs	864
Number of Logic Elements/Cells	3888
Total RAM Bits	49152
Number of I/O	260
Number of Gates	150000
Voltage - Supply	2.375V ~ 2.625V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	456-BBGA
Supplier Device Package	456-FBGA (23x23)
Purchase URL	https://www.e-xfl.com/product-detail/xilinx/xc2s150-5fg456c

Architectural Description

Spartan-II FPGA Array

The Spartan®-II field-programmable gate array, shown in Figure 2, is composed of five major configurable elements:

- IOBs provide the interface between the package pins and the internal logic
- CLBs provide the functional elements for constructing most logic
- Dedicated block RAM memories of 4096 bits each
- Clock DLLs for clock-distribution delay compensation and clock domain control
- Versatile multi-level interconnect structure

As can be seen in Figure 2, the CLBs form the central logic structure with easy access to all support and routing structures. The IOBs are located around all the logic and memory elements for easy and quick routing of signals on and off the chip.

Values stored in static memory cells control all the configurable logic elements and interconnect resources. These values load into the memory cells on power-up, and can reload if necessary to change the function of the device.

Each of these elements will be discussed in detail in the following sections.

Input/Output Block

The Spartan-II FPGA IOB, as seen in Figure 2, features inputs and outputs that support a wide variety of I/O signaling standards. These high-speed inputs and outputs are capable of supporting various state of the art memory and bus interfaces. Table 3 lists several of the standards which are supported along with the required reference, output and termination voltages needed to meet the standard.

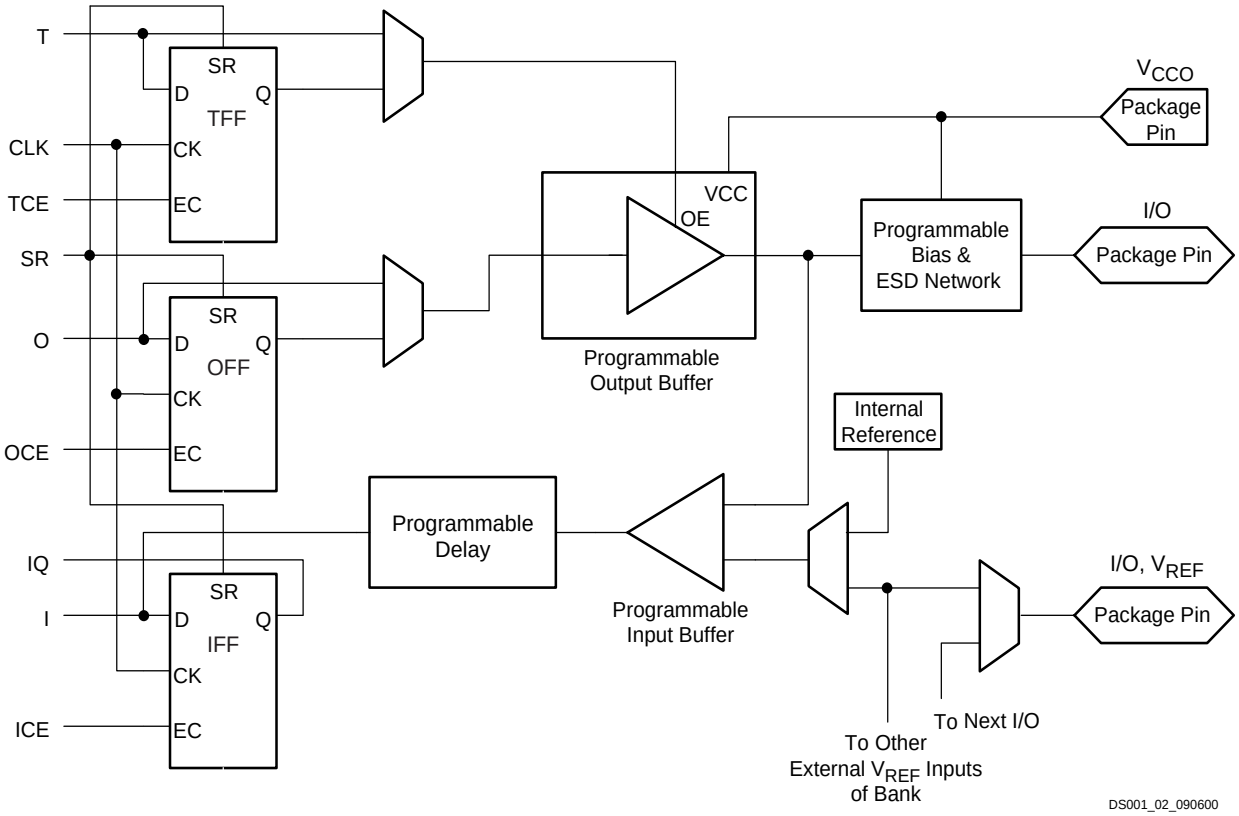


Figure 2: **Spartan-II FPGA Input/Output Block (IOB)**

By default, these operations are synchronized to CCLK. The entire start-up sequence lasts eight cycles, called C0-C7, after which the loaded design is fully functional. The default timing for start-up is shown in the top half of Figure 13. The four operations can be selected to switch on any CCLK cycle C1-C6 through settings in the Xilinx software. Heavy lines show default settings.

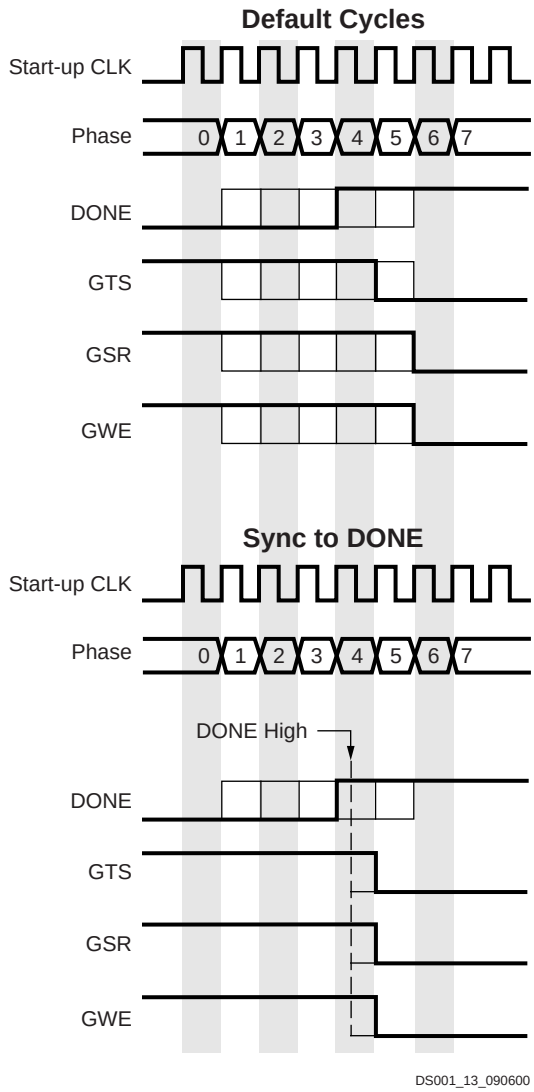

Figure 13: **Start-Up Waveforms**

The bottom half of Figure 13 shows another commonly used version of the start-up timing known as Sync-to-DONE. This version makes the GTS, GSR, and GWE events conditional upon the DONE pin going High. This timing is important for a daisy chain of multiple FPGAs in serial mode, since it ensures that all FPGAs go through start-up together, after all their DONE pins have gone High.

Sync-to-DONE timing is selected by setting the GTS, GSR, and GWE cycles to a value of DONE in the configuration options. This causes these signals to transition one clock cycle after DONE externally transitions High.

Serial Modes

There are two serial configuration modes: In Master Serial mode, the FPGA controls the configuration process by driving CCLK as an output. In Slave Serial mode, the FPGA passively receives CCLK as an input from an external agent (e.g., a microprocessor, CPLD, or second FPGA in master mode) that is controlling the configuration process. In both modes, the FPGA is configured by loading one bit per CCLK cycle. The MSB of each configuration data byte is always written to the DIN pin first.

See Figure 14 for the sequence for loading data into the Spartan-II FPGA serially. This is an expansion of the "Load Configuration Data Frames" block in Figure 11. Note that $\overline{CS}$ and $\overline{WRITE}$ normally are not used during serial configuration. To ensure successful loading of the FPGA, do not toggle $\overline{WRITE}$ with $\overline{CS}$ Low during serial configuration.

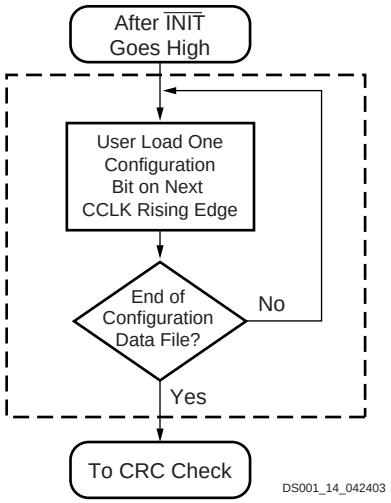

Figure 14: **Loading Serial Mode Configuration Data**

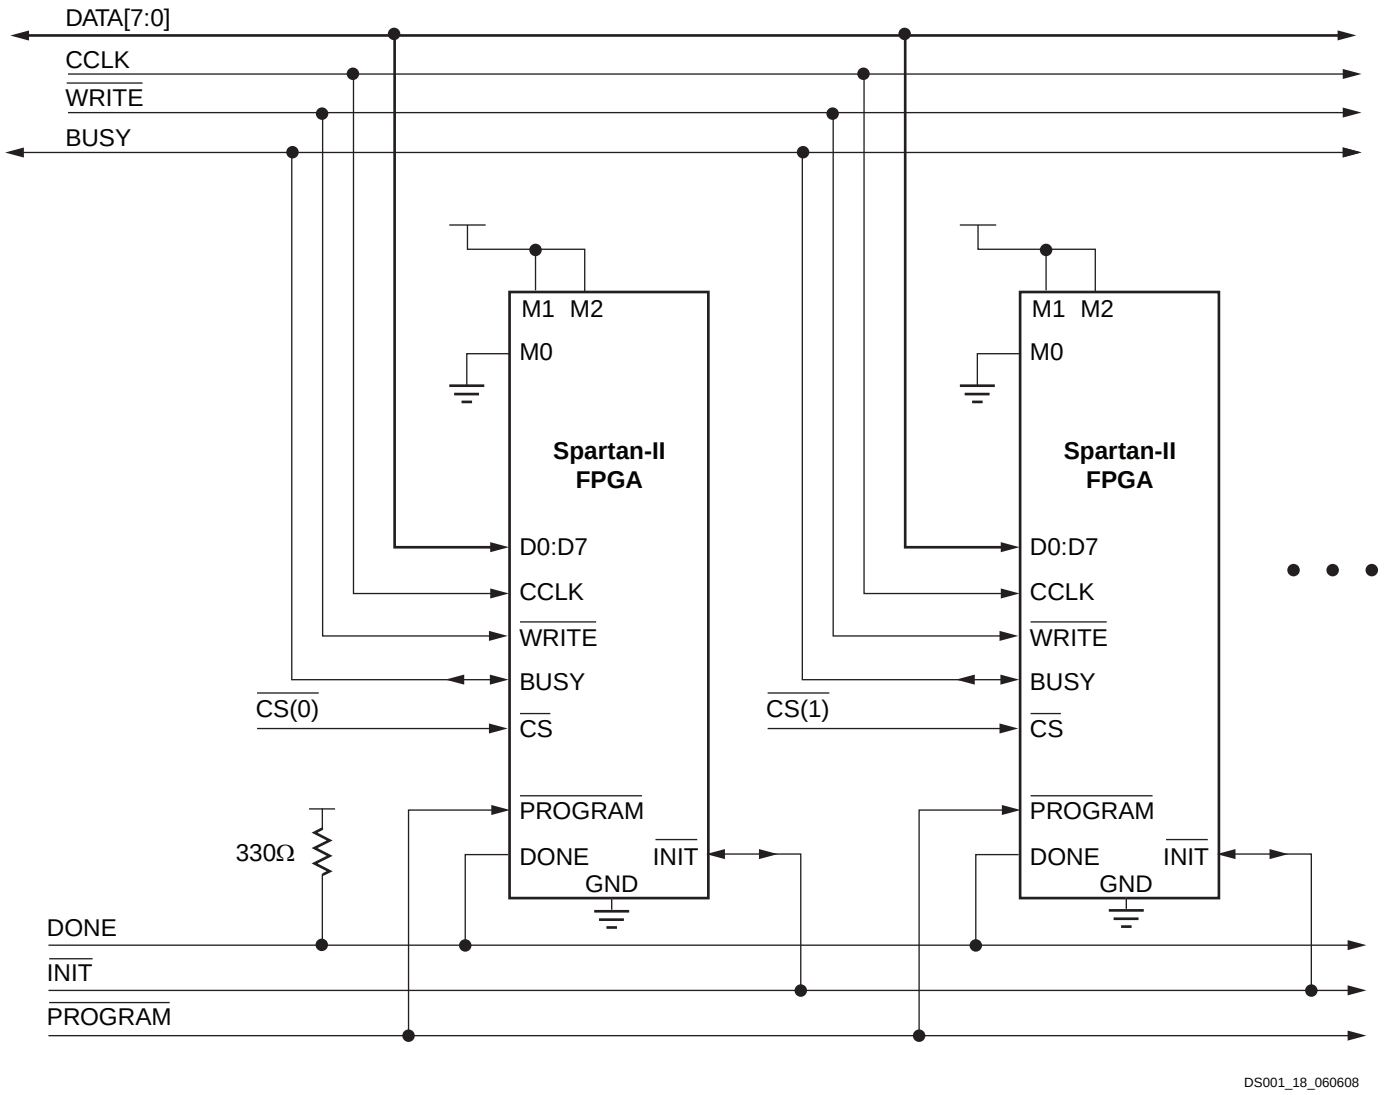

Figure 18: **Slave Parallel Configuration Circuit Diagram**

Multiple Spartan-II FPGAs can be configured using the Slave Parallel mode, and be made to start-up simultaneously. To configure multiple devices in this way, wire the individual CCLK, Data, $\overline{\text{WRITE}}$, and BUSY pins of all the devices in parallel. The individual devices are loaded separately by asserting the $\overline{\text{CS}}$ pin of each device in turn and writing the appropriate data. Sync-to-DONE start-up timing is used to ensure that the start-up sequence does not begin until all the FPGAs have been loaded. See "Start-up," page 19.

Write

When using the Slave Parallel Mode, write operations send packets of byte-wide configuration data into the FPGA. Figure 19, page 25 shows a flowchart of the write sequence used to load data into the Spartan-II FPGA. This is an expansion of the "Load Configuration Data Frames" block in Figure 11, page 18. The timing for write operations is shown in Figure 20, page 26.

For the present example, the user holds $\overline{\text{WRITE}}$ and $\overline{\text{CS}}$ Low throughout the sequence of write operations. Note that when $\overline{\text{CS}}$ is asserted on successive CCLKs, $\overline{\text{WRITE}}$ must remain either asserted or de-asserted. Otherwise an abort will be initiated, as in the next section.

1. Drive data onto D0-D7. Note that to avoid contention, the data source should not be enabled while $\overline{\text{CS}}$ is Low and $\overline{\text{WRITE}}$ is High. Similarly, while $\overline{\text{WRITE}}$ is High, no more than one device's $\overline{\text{CS}}$ should be asserted.
2. On the rising edge of CCLK: If BUSY is Low, the data is accepted on this clock. If BUSY is High (from a previous write), the data is not accepted. Acceptance will instead occur on the first clock after BUSY goes Low, and the data must be held until this happens.
3. Repeat steps 1 and 2 until all the data has been sent.
4. De-assert $\overline{\text{CS}}$ and $\overline{\text{WRITE}}$.

Design Considerations

This section contains more detailed design information on the following features:

Using Delay-Locked Loops

The Spartan-II FPGA family provides up to four fully digital dedicated on-chip Delay-Locked Loop (DLL) circuits which provide zero propagation delay, low clock skew between output clock signals distributed throughout the device, and advanced clock domain control. These dedicated DLLs can be used to implement several circuits that improve and simplify system level design.

Introduction

Quality on-chip clock distribution is important. Clock skew and clock delay impact device performance and the task of managing clock skew and clock delay with conventional clock trees becomes more difficult in large devices. The Spartan-II family of devices resolve this potential problem by providing up to four fully digital dedicated on-chip Delay-Locked Loop (DLL) circuits which provide zero propagation delay and low clock skew between output clock signals distributed throughout the device.

Each DLL can drive up to two global clock routing networks within the device. The global clock distribution network minimizes clock skews due to loading differences. By monitoring a sample of the DLL output clock, the DLL can compensate for the delay on the routing network, effectively eliminating the delay from the external input port to the individual clock loads within the device.

In addition to providing zero delay with respect to a user source clock, the DLL can provide multiple phases of the source clock. The DLL can also act as a clock doubler or it can divide the user source clock by up to 16.

Clock multiplication gives the designer a number of design alternatives. For instance, a 50 MHz source clock doubled by the DLL can drive an FPGA design operating at 100 MHz. This technique can simplify board design because the clock path on the board no longer distributes such a high-speed signal. A multiplied clock also provides designers the option of time-domain-multiplexing, using one circuit twice per clock cycle, consuming less area than two copies of the same circuit.

The DLL can also act as a clock mirror. By driving the DLL output off-chip and then back in again, the DLL can be used to de-skew a board level clock between multiple devices.

In order to guarantee the system clock establishes prior to the device "waking up," the DLL can delay the completion of the device configuration process until after the DLL achieves lock.

By taking advantage of the DLL to remove on-chip clock delay, the designer can greatly simplify and improve system level design involving high-fanout, high-performance clocks.

Library DLL Primitives

Figure 22 shows the simplified Xilinx library DLL macro, BUFGDLL. This macro delivers a quick and efficient way to provide a system clock with zero propagation delay throughout the device. Figure 23 and Figure 24 show the two library DLL primitives. These primitives provide access to the complete set of DLL features when implementing more complex applications.

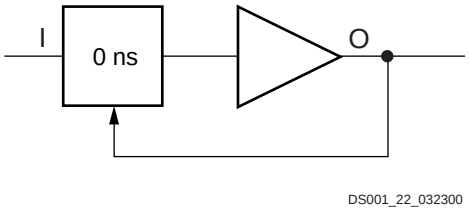

Figure 22: **Simplified DLL Macro BUFGDLL**

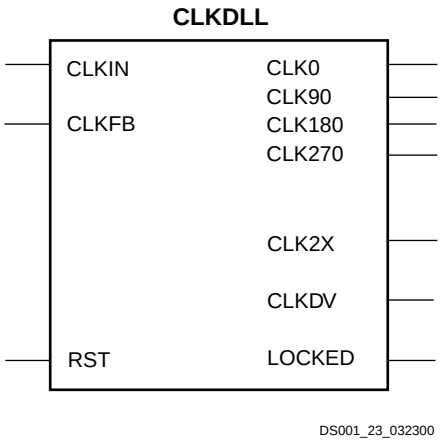

Figure 23: **Standard DLL Primitive CLKDLL**

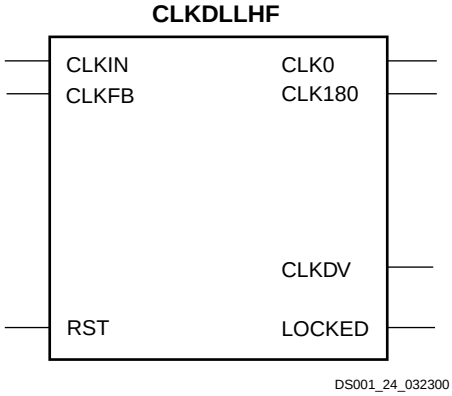

Figure 24: **High-Frequency DLL Primitive CLKDLLHF**

Useful Application Examples

The Spartan-II FPGA DLL can be used in a variety of creative and useful applications. The following examples show some of the more common applications.

Standard Usage

The circuit shown in Figure 28 resembles the BUFGDLL macro implemented to provide access to the RST and LOCKED pins of the CLKDLL.

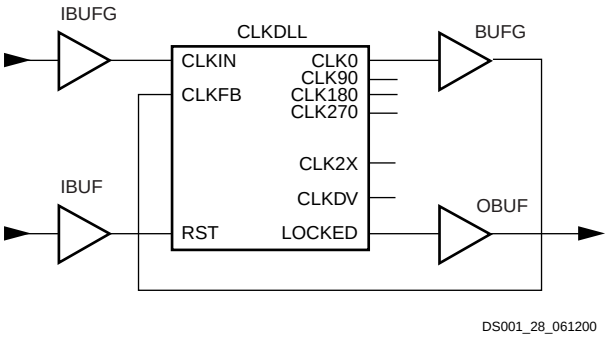

Figure 28: **Standard DLL Implementation**

Deskew of Clock and Its 2x Multiple

The circuit shown in Figure 29 implements a 2x clock multiplier and also uses the CLK0 clock output with zero ns skew between registers on the same chip. A clock divider circuit could alternatively be implemented using similar connections.

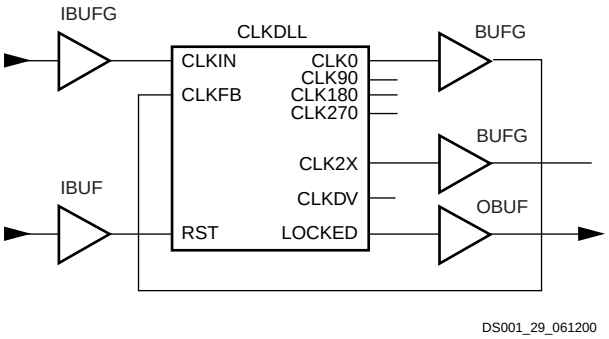

Figure 29: **DLL Deskew of Clock and 2x Multiple**

Because any single DLL can only access at most two BUFGs, any additional output clock signals must be routed from the DLL in this example on the high speed backbone routing.

Generating a 4x Clock

By connecting two DLL circuits each implementing a 2x clock multiplier in series as shown in Figure 30, a 4x clock multiply can be implemented with zero skew between registers in the same device.

If other clock output is needed, the clock could access a BUFG only if the DLLs are constrained to exist on opposite edges (Top or Bottom) of the device.

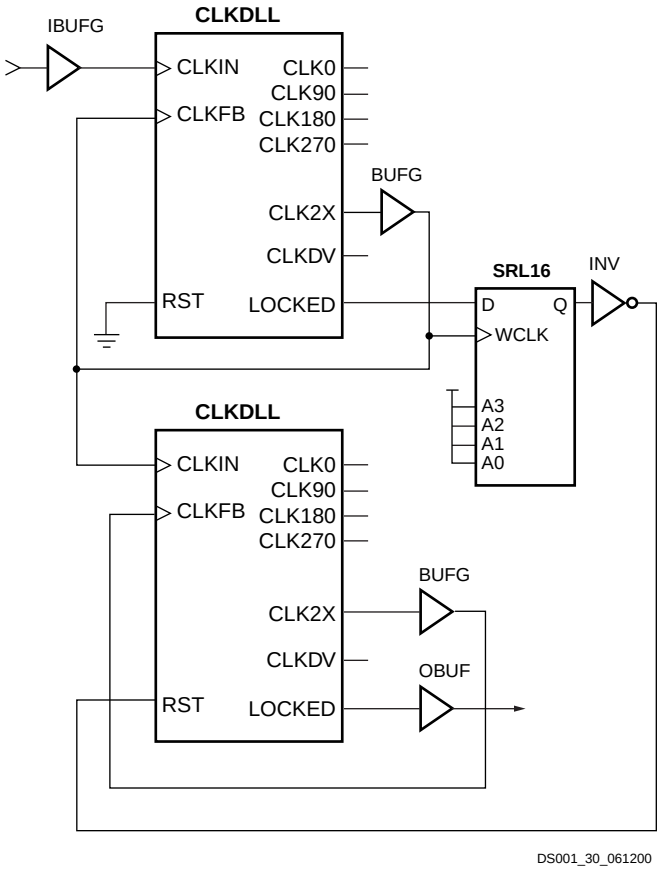

Figure 30: **DLL Generation of 4x Clock**

When using this circuit it is vital to use the SRL16 cell to reset the second DLL after the initial chip reset. If this is not done, the second DLL may not recognize the change of frequencies from when the input changes from a 1x (25/75) waveform to a 2x (50/50) waveform. It is not recommended to cascade more than two DLLs.

For design examples and more information on using the DLL, see XAPP174, *Using Delay-Locked Loops in Spartan-II FPGAs*.

support of a wide variety of applications, from general purpose standard applications to high-speed low-voltage memory busses.

Versatile I/O blocks also provide selectable output drive strengths and programmable slew rates for the LVTTL output buffers, as well as an optional, programmable weak pull-up, weak pull-down, or weak "keeper" circuit ideal for use in external bussing applications.

Each Input/Output Block (IOB) includes three registers, one each for the input, output, and 3-state signals within the IOB. These registers are optionally configurable as either a D-type flip-flop or as a level sensitive latch.

The input buffer has an optional delay element used to guarantee a zero hold time requirement for input signals registered within the IOB.

The Versatile I/O features also provide dedicated resources for input reference voltage (V_{REF}) and output source voltage (V_{CCO}), along with a convenient banking system that simplifies board design.

By taking advantage of the built-in features and wide variety of I/O standards supported by the Versatile I/O features, system-level design and board design can be greatly simplified and improved.

Fundamentals

Modern bus applications, pioneered by the largest and most influential companies in the digital electronics industry, are commonly introduced with a new I/O standard tailored specifically to the needs of that application. The bus I/O standards provide specifications to other vendors who create products designed to interface with these applications. Each standard often has its own specifications for current, voltage, I/O buffering, and termination techniques.

The ability to provide the flexibility and time-to-market advantages of programmable logic is increasingly dependent on the capability of the programmable logic device to support an ever increasing variety of I/O standards

The Versatile I/O resources feature highly configurable input and output buffers which provide support for a wide variety of I/O standards. As shown in Table 15, each buffer type can support a variety of voltage requirements.

Table 15: **Versatile I/O Supported Standards (Typical Values)**

I/O Standard	Input Reference Voltage (V_{REF})	Output Source Voltage (V_{CCO})	Board Termination Voltage (V_{TT})
LVTTL (2-24 mA)	N/A	3.3	N/A
LVCMOS2	N/A	2.5	N/A
PCI (3V/5V, 33 MHz/66 MHz)	N/A	3.3	N/A
GTL	0.8	N/A	1.2
GTL+	1.0	N/A	1.5
HSTL Class I	0.75	1.5	0.75
HSTL Class III	0.9	1.5	1.5
HSTL Class IV	0.9	1.5	1.5
SSTL3 Class I and II	1.5	3.3	1.5
SSTL2 Class I and II	1.25	2.5	1.25
CTT	1.5	3.3	1.5
AGP-2X	1.32	3.3	N/A

Overview of Supported I/O Standards

This section provides a brief overview of the I/O standards supported by all Spartan-II devices.

While most I/O standards specify a range of allowed voltages, this document records typical voltage values only. Detailed information on each specification may be found on the Electronic Industry Alliance JEDEC website at http://www.jedec.org. For more details on the I/O standards and termination application examples, see XAPP179, "*Using SelectIO Interfaces in Spartan-II and Spartan-IIE FPGAs.*"

LVTTL — Low-Voltage TTL

The Low-Voltage TTL (LVTTL) standard is a general purpose EIA/JESDSA standard for 3.3V applications that uses an LVTTL input buffer and a Push-Pull output buffer. This standard requires a 3.3V output source voltage (V_{CCO}), but does not require the use of a reference voltage (V_{REF}) or a termination voltage (V_{TT}).

LVCMOS2 — Low-Voltage CMOS for 2.5V

The Low-Voltage CMOS for 2.5V or lower (LVCMOS2) standard is an extension of the LVCMOS standard (JESD 8.5) used for general purpose 2.5V applications. This standard requires a 2.5V output source voltage (V_{CCO}), but does not require the use of a reference voltage (V_{REF}) or a board termination voltage (V_{TT}).

LVTTL output buffers have selectable drive strengths.

The format for LVTTL OBUF primitive names is as follows.

OBUF_<slew_rate>_<drive_strength>

<slew_rate> is either F (Fast), or S (Slow) and <drive_strength> is specified in milliamps (2, 4, 6, 8, 12, 16, or 24). The default is slew rate limited with 12 mA drive.

OBUF placement restrictions require that within a given V_{CCO} bank each OBUF share the same output source drive voltage. Input buffers of any type and output buffers that do not require V_{CCO} can be placed within any V_{CCO} bank. Table 17 summarizes the output compatibility requirements. The LOC property can specify a location for the OBUF.

Table 17: **Output Standards Compatibility Requirements**

Rule 1	Only outputs with standards which share compatible V_{CCO} may be used within the same bank.
Rule 2	There are no placement restrictions for outputs with standards that do not require a V_{CCO}.
V_{CCO}	Compatible Standards
3.3	LVTTL, SSTL3_I, SSTL3_II, CTT, AGP, GTL, GTL+, PCI33_3, PCI66_3
2.5	SSTL2_I, SSTL2_II, LVCMOS2, GTL, GTL+
1.5	HSTL_I, HSTL_III, HSTL_IV, GTL, GTL+

OBUFT

The generic 3-state output buffer OBUFT, shown in Figure 39, typically implements 3-state outputs or bidirectional I/O.

With no extension or property specified for the generic OBUFT primitive, the assumed standard is slew rate limited LVTTL with 12 mA drive strength.

The LVTTL OBUFT can support one of two slew rate modes to minimize bus transients. By default, the slew rate for each output buffer is reduced to minimize power bus transients when switching non-critical signals.

LVTTL 3-state output buffers have selectable drive strengths.

The format for LVTTL OBUFT primitive names is as follows.

OBUFT_<slew_rate>_<drive_strength>

<slew_rate> can be either F (Fast), or S (Slow) and <drive_strength> is specified in milliamps (2, 4, 6, 8, 12, 16, or 24).

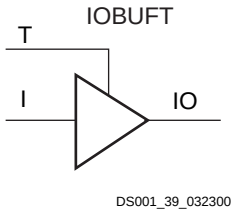

Figure 39: **3-State Output Buffer Primitive (OBUFT**

The Versatile I/O OBUFT placement restrictions require that within a given V_{CCO} bank each OBUFT share the same output source drive voltage. Input buffers of any type and output buffers that do not require V_{CCO} can be placed within the same V_{CCO} bank.

The LOC property can specify a location for the OBUFT.

3-state output buffers and bidirectional buffers can have either a weak pull-up resistor, a weak pull-down resistor, or a weak "keeper" circuit. Control this feature by adding the appropriate primitive to the output net of the OBUFT (PULLUP, PULLDOWN, or KEEPER).

The weak "keeper" circuit requires the input buffer within the IOB to sample the I/O signal. So, OBUFTs programmed for an I/O standard that requires a V_{REF} have automatic placement of a V_{REF} in the bank with an OBUFT configured with a weak "keeper" circuit. This restriction does not affect most circuit design as applications using an OBUFT configured with a weak "keeper" typically implement a bidirectional I/O. In this case the IBUF (and the corresponding V_{REF}) are explicitly placed.

The LOC property can specify a location for the OBUFT.

IOBUF

Use the IOBUF primitive for bidirectional signals that require both an input buffer and a 3-state output buffer with an active high 3-state pin. The generic input/output buffer IOBUF appears in Figure 40.

With no extension or property specified for the generic IOBUF primitive, the assumed standard is LVTTL input buffer and slew rate limited LVTTL with 12 mA drive strength for the output buffer.

The LVTTL IOBUF can support one of two slew rate modes to minimize bus transients. By default, the slew rate for each output buffer is reduced to minimize power bus transients when switching non-critical signals.

LVTTL bidirectional buffers have selectable output drive strengths.

The format for LVTTL IOBUF primitive names is as follows:

GTL

A sample circuit illustrating a valid termination technique for GTL is shown in Figure 42. Table 20 lists DC voltage specifications for the GTL standard. See "DC Specifications" in Module 3 for the actual FPGA characteristics.

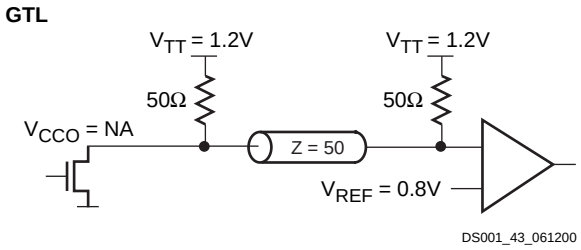

Figure 42: **Terminated GTL**

Table 20: **GTL Voltage Specifications**

Parameter	Min	Typ	Max
V_{CCO}	-	N/A	-
$V_{REF} = N \times V_{TT}$ (1)	0.74	0.8	0.86
V_{TT}	1.14	1.2	1.26
$V_{IH} \geq V_{REF} + 0.05$	0.79	0.85	-
$V_{IL} \leq V_{REF} - 0.05$	-	0.75	0.81
V_{OH}	-	-	-
V_{OL}	-	0.2	0.4
I_{OH} at V_{OH} (mA)	-	-	-
I_{OL} at V_{OL} (mA) at 0.4V	32	-	-
I_{OL} at V_{OL} (mA) at 0.2V	-	-	40

Notes:
1. N must be greater than or equal to 0.653 and less than or equal to 0.68.

GTL+

A sample circuit illustrating a valid termination technique for GTL+ appears in Figure 43. DC voltage specifications appear in Table 21 for the GTL+ standard. See "DC Specifications" in Module 3 for the actual FPGA characteristics.

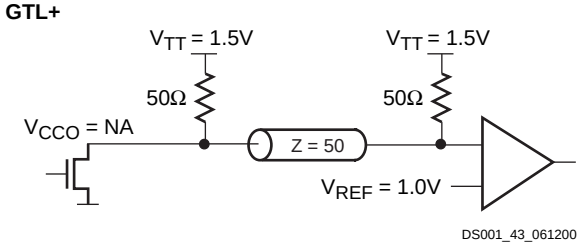

Figure 43: **Terminated GTL+**

Table 21: **GTL+ Voltage Specifications**

Parameter	Min	Typ	Max
V_{CCO}	-	-	-
$V_{REF} = N \times V_{TT}$ (1)	0.88	1.0	1.12
V_{TT}	1.35	1.5	1.65
$V_{IH} \geq V_{REF} + 0.1$	0.98	1.1	-
$V_{IL} \leq V_{REF} - 0.1$	-	0.9	1.02
V_{OH}	-	-	-
V_{OL}	0.3	0.45	0.6
I_{OH} at V_{OH} (mA)	-	-	-
I_{OL} at V_{OL} (mA) at 0.6V	36	-	-
I_{OL} at V_{OL} (mA) at 0.3V	-	-	48

Notes:
1. N must be greater than or equal to 0.653 and less than or equal to 0.68.

HSTL Class I

A sample circuit illustrating a valid termination technique for HSTL_I appears in Figure 44. DC voltage specifications appear in Table 22 for the HSTL_1 standard. See "DC Specifications" in Module 3 for the actual FPGA characteristics.

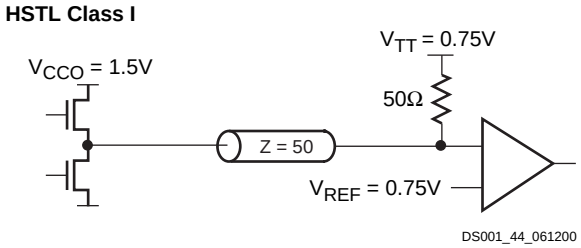

Figure 44: **Terminated HSTL Class I**

Table 22: **HSTL Class I Voltage Specification**

Parameter	Min	Typ	Max
V_{CCO}	1.40	1.50	1.60
V_{REF}	0.68	0.75	0.90
V_{TT}	-	$V_{CCO} \times 0.5$	-
V_{IH}	$V_{REF} + 0.1$	-	-
V_{IL}	-	-	$V_{REF} - 0.1$
V_{OH}	$V_{CCO} - 0.4$	-	-
V_{OL}			0.4
I_{OH} at V_{OH} (mA)	–8	-	-
I_{OL} at V_{OL} (mA)	8	-	-

Revision History

Date	Version	Description
09/18/00	2.0	Sectioned the Spartan-II Family data sheet into four modules. Corrected banking description.
03/05/01	2.1	Clarified guidelines for applying power to V_{CCINT} and V_{CCO}
09/03/03	2.2	The following changes were made: • "Serial Modes," page 20 cautions about toggling $\overline{WRITE}$ during serial configuration. • Maximum V_{IH} values in Table 32 and Table 33 changed to 5.5V. • In "Boundary Scan," page 13, removed sentence about lack of INTEST support. • In Table 9, page 17, added note about the state of I/Os after power-on. • In "Slave Parallel Mode," page 23, explained configuration bit alignment to SelectMap port.
06/13/08	2.8	Added note that TDI, TMS, and TCK have a default pull-up resistor. Added note on maximum daisy chain limit. Updated Figure 15 and Figure 18 since Mode pins can be pulled up to either 2.5V or 3.3V. Updated DLL section. Recommended using property or attribute instead of primitive to define I/O properties. Updated description and links. Updated all modules for continuous page, figure, and table numbering. Synchronized all modules to v2.8.

Input/Output Standard	V_{IL}		V_{IH}		V_{OL}	V_{OH}	I_{OL}	I_{OH}
	V, Min	V, Max	V, Min	V, Max	V, Max	V, Min	mA	mA
CTT	–0.5	V_{REF} – 0.2	V_{REF} + 0.2	3.6	V_{REF} – 0.4	V_{REF} + 0.4	8	–8
AGP	–0.5	V_{REF} – 0.2	V_{REF} + 0.2	3.6	10% V_{CCO}	90% V_{CCO}	Note (2)	Note (2)

Notes:
1. V_{OL} and V_{OH} for lower drive currents are sample tested.
2. Tested according to the relevant specifications.

Switching Characteristics

All devices are 100% functionally tested. Internal timing parameters are derived from measuring internal test patterns. Listed below are representative values. For more specific, more precise, and worst-case guaranteed data, use the values reported by the static timing analyzer (TRCE in the Xilinx Development System) and back-annotated to the simulation netlist. All timing parameters assume worst-case operating conditions (supply voltage and junction temperature). Values apply to all Spartan-II devices unless otherwise noted.

Global Clock Input to Output Delay for LVTTL, *with* DLL (Pin-to-Pin)(1)

Symbol	Description	Device	Speed Grade			Units
			All	-6	-5	
			Min	Max	Max	
$T_{ICKOFDLL}$	Global clock input to output delay using output flip-flop for LVTTL, 12 mA, fast slew rate, *with* DLL.	All		2.9	3.3	ns

Notes:
1. Listed above are representative values where one global clock input drives one vertical clock line in each accessible column, and where all accessible IOB and CLB flip-flops are clocked by the global clock net.
2. Output timing is measured at 1.4V with 35 pF external capacitive load for LVTTL. The 35 pF load does not apply to the Min values. For other I/O standards and different loads, see the tables "Constants for Calculating TIOOP" and "Delay Measurement Methodology," page 60.
3. DLL output jitter is already included in the timing calculation.
4. For data *output* with different standards, adjust delays with the values shown in "IOB Output Delay Adjustments for Different Standards," page 59. For a global clock input with standards other than LVTTL, adjust delays with values from the "I/O Standard Global Clock Input Adjustments," page 61.

Global Clock Input to Output Delay for LVTTL, *without* DLL (Pin-to-Pin)(1)

Symbol	Description	Device	Speed Grade			Units
			All	-6	-5	
			Min	Max	Max	
T_{ICKOF}	Global clock input to output delay using output flip-flop for LVTTL, 12 mA, fast slew rate, *without* DLL.	XC2S15		4.5	5.4	ns
		XC2S30		4.5	5.4	ns
		XC2S50		4.5	5.4	ns
		XC2S100		4.6	5.5	ns
		XC2S150		4.6	5.5	ns
		XC2S200		4.7	5.6	ns

Notes:
1. Listed above are representative values where one global clock input drives one vertical clock line in each accessible column, and where all accessible IOB and CLB flip-flops are clocked by the global clock net.
2. Output timing is measured at 1.4V with 35 pF external capacitive load for LVTTL. The 35 pF load does not apply to the Min values. For other I/O standards and different loads, see the tables "Constants for Calculating TIOOP" and "Delay Measurement Methodology," page 60.
3. For data *output* with different standards, adjust delays with the values shown in "IOB Output Delay Adjustments for Different Standards," page 59. For a global clock input with standards other than LVTTL, adjust delays with values from the "I/O Standard Global Clock Input Adjustments," page 61.

IOB Output Switching Characteristics

Output delays terminating at a pad are specified for LVTTL with 12 mA drive and fast slew rate. For other standards, adjust the delays with the values shown in "IOB Output Delay Adjustments for Different Standards," page 59.

Symbol	Description	Speed Grade				Units
		-6		-5		
		Min	Max	Min	Max	
Propagation Delays						
T_{IOOP}	O input to pad	-	2.9	-	3.4	ns
T_{IOOLP}	O input to pad via transparent latch	-	3.4	-	4.0	ns
3-state Delays						
T_{IOTHZ}	T input to pad high-impedance(1)	-	2.0	-	2.3	ns
T_{IOTON}	T input to valid data on pad	-	3.0	-	3.6	ns
$T_{IOTLPHZ}$	T input to pad high impedance via transparent latch(1)	-	2.5	-	2.9	ns
$T_{IOTLPON}$	T input to valid data on pad via transparent latch	-	3.5	-	4.2	ns
T_{GTS}	GTS to pad high impedance(1)	-	5.0	-	5.9	ns
Sequential Delays						
T_{IOCKP}	Clock CLK to pad	-	2.9	-	3.4	ns
T_{IOCKHZ}	Clock CLK to pad high impedance (synchronous)(1)	-	2.3	-	2.7	ns
T_{IOCKON}	Clock CLK to valid data on pad (synchronous)	-	3.3	-	4.0	ns
Setup/Hold Times with Respect to Clock CLK(2)						
T_{IOOCK} / T_{IOCKO}	O input	1.1 / 0	-	1.3 / 0	-	ns
$T_{IOOCECK}$ / $T_{IOCKOCE}$	OCE input	0.9 / 0.01	-	0.9 / 0.01	-	ns
$T_{IOSRCKO}$ / $T_{IOCKOSR}$	SR input (OFF)	1.2 / 0	-	1.3 / 0	-	ns
T_{IOTCK} / T_{IOCKT}	3-state setup times, T input	0.8 / 0	-	0.9 / 0	-	ns
$T_{IOTCECK}$ / $T_{IOCKTCE}$	3-state setup times, TCE input	1.0 / 0	-	1.0 / 0	-	ns
$T_{IOSRCKT}$ / $T_{IOCKTSR}$	3-state setup times, SR input (TFF)	1.1 / 0	-	1.2 / 0	-	ns
Set/Reset Delays						
T_{IOSRP}	SR input to pad (asynchronous)	-	3.7	-	4.4	ns
T_{IOSRHZ}	SR input to pad high impedance (asynchronous)(1)	-	3.1	-	3.7	ns
T_{IOSRON}	SR input to valid data on pad (asynchronous)	-	4.1	-	4.9	ns
T_{IOGSRQ}	GSR to pad	-	9.9	-	11.7	ns

Notes:
1. Three-state turn-off delays should not be adjusted.
2. A zero hold time listing indicates no hold time or a negative hold time.

IOB Output Delay Adjustments for Different Standards(1)

Output delays terminating at a pad are specified for LVTTL with 12 mA drive and fast slew rate. For other standards, adjust the delays by the values shown. A delay adjusted in this way constitutes a worst-case limit.

Symbol	Description	Standard	Speed Grade		Units
			-6	-5	
Output Delay Adjustments (Adj)					
T_{OLVTTL_S2}	Standard-specific adjustments for output delays terminating at pads (based on standard capacitive load, C_{SL})	LVTTL, Slow, 2 mA	14.2	16.9	ns
T_{OLVTTL_S4}		4 mA	7.2	8.6	ns
T_{OLVTTL_S6}		6 mA	4.7	5.5	ns
T_{OLVTTL_S8}		8 mA	2.9	3.5	ns
T_{OLVTTL_S12}		12 mA	1.9	2.2	ns
T_{OLVTTL_S16}		16 mA	1.7	2.0	ns
T_{OLVTTL_S24}		24 mA	1.3	1.5	ns
T_{OLVTTL_F2}		LVTTL, Fast, 2 mA	12.6	15.0	ns
T_{OLVTTL_F4}		4 mA	5.1	6.1	ns
T_{OLVTTL_F6}		6 mA	3.0	3.6	ns
T_{OLVTTL_F8}		8 mA	1.0	1.2	ns
T_{OLVTTL_F12}		12 mA	0	0	ns
T_{OLVTTL_F16}		16 mA	–0.1	–0.1	ns
T_{OLVTTL_F24}		24 mA	–0.1	–0.2	ns
$T_{OLVCMOS2}$		LVCMOS2	0.2	0.2	ns
T_{OPCI33_3}		PCI, 33 MHz, 3.3V	2.4	2.9	ns
T_{OPCI33_5}		PCI, 33 MHz, 5.0V	2.9	3.5	ns
T_{OPCI66_3}		PCI, 66 MHz, 3.3V	–0.3	–0.4	ns
T_{OGTL}		GTL	0.6	0.7	ns
T_{OGTLP}		GTL+	0.9	1.1	ns
T_{OHSTL_I}		HSTL I	–0.4	–0.5	ns
T_{OHSTL_III}		HSTL III	–0.8	–1.0	ns
T_{OHSTL_IV}		HSTL IV	–0.9	–1.1	ns
T_{OSSTL2_I}		SSTL2 I	–0.4	–0.5	ns
T_{OSSLT2_II}		SSTL2 II	–0.8	–1.0	ns
T_{OSSTL3_I}		SSTL3 I	–0.4	–0.5	ns
T_{OSSTL3_II}		SSTL3 II	–0.9	–1.1	ns
T_{OCTT}		CTT	–0.5	–0.6	ns
T_{OAGP}		AGP	–0.8	–1.0	ns

Notes:

1. Output timing is measured at 1.4V with 35 pF external capacitive load for LVTTL. For other I/O standards and different loads, see the tables "Constants for Calculating TIOOP" and "Delay Measurement Methodology," page 60.

Calculation of T_{IOOP} as a Function of Capacitance

T_{IOOP} is the propagation delay from the O Input of the IOB to the pad. The values for T_{IOOP} are based on the standard capacitive load (C_{SL}) for each I/O standard as listed in the table "Constants for Calculating TIOOP", below.

For other capacitive loads, use the formulas below to calculate an adjusted propagation delay, T_{IOOP1}.

$$T_{IOOP1} = T_{IOOP} + Adj + (C_{LOAD} - C_{SL}) * F_L$$

Where:

- Adj is selected from "IOB Output Delay Adjustments for Different Standards", page 59, according to the I/O standard used
- C_{LOAD} is the capacitive load for the design
- F_L is the capacitance scaling factor

Delay Measurement Methodology

Standard	V_L (1)	V_H (1)	Meas. Point	V_{REF} Typ (2)
LVTTL	0	3	1.4	-
LVCMOS2	0	2.5	1.125	-
PCI33_5	Per PCI Spec			-
PCI33_3	Per PCI Spec			-
PCI66_3	Per PCI Spec			-
GTL	V_{REF} – 0.2	V_{REF} + 0.2	V_{REF}	0.80
GTL+	V_{REF} – 0.2	V_{REF} + 0.2	V_{REF}	1.0
HSTL Class I	V_{REF} – 0.5	V_{REF} + 0.5	V_{REF}	0.75
HSTL Class III	V_{REF} – 0.5	V_{REF} + 0.5	V_{REF}	0.90
HSTL Class IV	V_{REF} – 0.5	V_{REF} + 0.5	V_{REF}	0.90
SSTL3 I and II	V_{REF} – 1.0	V_{REF} + 1.0	V_{REF}	1.5
SSTL2 I and II	V_{REF} – 0.75	V_{REF} + 0.75	V_{REF}	1.25
CTT	V_{REF} – 0.2	V_{REF} + 0.2	V_{REF}	1.5
AGP	V_{REF} – (0.2xV_{CCO})	V_{REF} + (0.2xV_{CCO})	V_{REF}	Per AGP Spec

Notes:
1. Input waveform switches between V_L and V_H.
2. Measurements are made at V_{REF} Typ, Maximum, and Minimum. Worst-case values are reported.
3. I/O parameter measurements are made with the capacitance values shown in the table, "Constants for Calculating TIOOP". See Xilinx application note XAPP179 for the appropriate terminations.
4. I/O standard measurements are reflected in the IBIS model information except where the IBIS format precludes it.

Constants for Calculating T_{IOOP}

Standard	C_{SL} (1) (pF)	F_L (ns/pF)
LVTTL Fast Slew Rate, 2 mA drive	35	0.41
LVTTL Fast Slew Rate, 4 mA drive	35	0.20
LVTTL Fast Slew Rate, 6 mA drive	35	0.13
LVTTL Fast Slew Rate, 8 mA drive	35	0.079
LVTTL Fast Slew Rate, 12 mA drive	35	0.044
LVTTL Fast Slew Rate, 16 mA drive	35	0.043
LVTTL Fast Slew Rate, 24 mA drive	35	0.033
LVTTL Slow Slew Rate, 2 mA drive	35	0.41
LVTTL Slow Slew Rate, 4 mA drive	35	0.20
LVTTL Slow Slew Rate, 6 mA drive	35	0.100
LVTTL Slow Slew Rate, 8 mA drive	35	0.086
LVTTL Slow Slew Rate, 12 mA drive	35	0.058
LVTTL Slow Slew Rate, 16 mA drive	35	0.050
LVTTL Slow Slew Rate, 24 mA drive	35	0.048
LVCMOS2	35	0.041
PCI 33 MHz 5V	50	0.050
PCI 33 MHZ 3.3V	10	0.050
PCI 66 MHz 3.3V	10	0.033
GTL	0	0.014
GTL+	0	0.017
HSTL Class I	20	0.022
HSTL Class III	20	0.016
HSTL Class IV	20	0.014
SSTL2 Class I	30	0.028
SSTL2 Class II	30	0.016
SSTL3 Class I	30	0.029
SSTL3 Class II	30	0.016
CTT	20	0.035
AGP	10	0.037

Notes:
1. I/O parameter measurements are made with the capacitance values shown above. See Xilinx application note XAPP179 for the appropriate terminations.
2. I/O standard measurements are reflected in the IBIS model information except where the IBIS format precludes it.

Clock Distribution Guidelines(1)

Symbol	Description	Speed Grade		Units
		-6	-5	
		Max	Max	
GCLK Clock Skew				
$T_{GSKEWIOB}$	Global clock skew between IOB flip-flops	0.13	0.14	ns

Notes:
1. These clock distribution delays are provided for guidance only. They reflect the delays encountered in a typical design under worst-case conditions. Precise values for a particular design are provided by the timing analyzer.

Clock Distribution Switching Characteristics

T_{GPIO} is specified for LVTTL levels. For other standards, adjust T_{GPIO} with the values shown in "I/O Standard Global Clock Input Adjustments".

Symbol	Description	Speed Grade		Units
		-6	-5	
		Max	Max	
GCLK IOB and Buffer				
T_{GPIO}	Global clock pad to output	0.7	0.8	ns
T_{GIO}	Global clock buffer I input to O output	0.7	0.8	ns

I/O Standard Global Clock Input Adjustments

Delays associated with a global clock input pad are specified for LVTTL levels. For other standards, adjust the delays by the values shown. A delay adjusted in this way constitutes a worst-case limit.

Symbol	Description	Standard	Speed Grade		Units
			-6	-5	
Data Input Delay Adjustments					
$T_{GPLVTTL}$	Standard-specific global clock input delay adjustments	LVTTL	0	0	ns
$T_{GPLVCMOS2}$		LVCMOS2	–0.04	–0.05	ns
$T_{GPPCI33\_3}$		PCI, 33 MHz, 3.3V	–0.11	–0.13	ns
$T_{GPPCI33\_5}$		PCI, 33 MHz, 5.0V	0.26	0.30	ns
$T_{GPPCI66\_3}$		PCI, 66 MHz, 3.3V	–0.11	–0.13	ns
T_{GPGTL}		GTL	0.80	0.84	ns
T_{GPGTLP}		GTL+	0.71	0.73	ns
T_{GPHSTL}		HSTL	0.63	0.64	ns
$T_{GPSSTL2}$		SSTL2	0.52	0.51	ns
$T_{GPSSTL3}$		SSTL3	0.56	0.55	ns
T_{GPCTT}		CTT	0.62	0.62	ns
T_{GPAGP}		AGP	0.54	0.53	ns

Notes:
1. Input timing for GPLVTTL is measured at 1.4V. For other I/O standards, see the table "Delay Measurement Methodology," page 60.

Notes:

1. IRDY and TRDY can only be accessed when using Xilinx PCI cores.
2. Pads labelled GND*, V_{CCINT}*, V_{CCO} Bank 0*, V_{CCO} Bank 1*, V_{CCO} Bank 2*, V_{CCO} Bank 3*, V_{CCO} Bank 4*, V_{CCO} Bank 5*, V_{CCO} Bank 6*, V_{CCO} Bank 7* are internally bonded to independent ground or power planes within the package.
3. See "VCCO Banks" for details on V_{CCO} banking.

11/02/00

Revision History

Version No.	Date	Description
2.0	09/18/00	Sectioned the Spartan-II Family data sheet into four modules. Corrected all known errors in the pinout tables.
2.1	10/04/00	Added notes requiring $\overline{PWDN}$ to be tied to V_{CCINT} when unused.
2.2	11/02/00	Removed the Power Down feature.
2.3	03/05/01	Added notes on pinout tables for IRDY and TRDY.
2.4	04/30/01	Reinstated XC2S50 V_{CCO} Bank 7, GND, and "not connected" pins missing in version 2.3.
2.5	09/03/03	Added caution about Not Connected Pins to XC2S30 pinout tables on page 76.
2.8	06/13/08	Added "Package Overview" section. Added notes to clarify shared V_{CCO} banks. Updated description and links. Updated all modules for continuous page, figure, and table numbering. Synchronized all modules to v2.8.
