

Welcome to <u>E-XFL.COM</u>

Understanding <u>Embedded - FPGAs (Field</u> <u>Programmable Gate Array)</u>

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details

Product Status	Active
Number of LABs/CLBs	1176
Number of Logic Elements/Cells	5292
Total RAM Bits	57344
Number of I/O	176
Number of Gates	200000
Voltage - Supply	2.375V ~ 2.625V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	256-BGA
Supplier Device Package	256-FBGA (17x17)
Purchase URL	https://www.e-xfl.com/product-detail/xilinx/xc2s200-5fgg256c

Email: info@E-XFL.COM

Address: Room A, 16/F, Full Win Commercial Centre, 573 Nathan Road, Mongkok, Hong Kong

∑ XILINX[®]

Local Routing

The local routing resources, as shown in Figure 6, provide the following three types of connections:

- Interconnections among the LUTs, flip-flops, and General Routing Matrix (GRM)
- Internal CLB feedback paths that provide high-speed connections to LUTs within the same CLB, chaining them together with minimal routing delay
- Direct paths that provide high-speed connections between horizontally adjacent CLBs, eliminating the delay of the GRM

Figure 6: Spartan-II Local Routing

General Purpose Routing

Most Spartan-II FPGA signals are routed on the general purpose routing, and consequently, the majority of interconnect resources are associated with this level of the routing hierarchy. The general routing resources are located in horizontal and vertical routing channels associated with the rows and columns CLBs. The general-purpose routing resources are listed below.

- Adjacent to each CLB is a General Routing Matrix (GRM). The GRM is the switch matrix through which horizontal and vertical routing resources connect, and is also the means by which the CLB gains access to the general purpose routing.
- 24 single-length lines route GRM signals to adjacent GRMs in each of the four directions.
- 96 buffered Hex lines route GRM signals to other GRMs six blocks away in each one of the four directions. Organized in a staggered pattern, Hex lines may be driven only at their endpoints. Hex-line signals can be accessed either at the endpoints or at the midpoint (three blocks from the source). One third of the Hex lines are bidirectional, while the remaining ones are unidirectional.
- 12 Longlines are buffered, bidirectional wires that distribute signals across the device quickly and

efficiently. Vertical Longlines span the full height of the device, and horizontal ones span the full width of the device.

I/O Routing

Spartan-II devices have additional routing resources around their periphery that form an interface between the CLB array and the IOBs. This additional routing, called the VersaRing, facilitates pin-swapping and pin-locking, such that logic redesigns can adapt to existing PCB layouts. Time-to-market is reduced, since PCBs and other system components can be manufactured while the logic design is still in progress.

Dedicated Routing

Some classes of signal require dedicated routing resources to maximize performance. In the Spartan-II architecture, dedicated routing resources are provided for two classes of signal.

- Horizontal routing resources are provided for on-chip 3-state busses. Four partitionable bus lines are provided per CLB row, permitting multiple busses within a row, as shown in Figure 7.
- Two dedicated nets per CLB propagate carry signals vertically to the adjacent CLB.

Global Routing

Global Routing resources distribute clocks and other signals with very high fanout throughout the device. Spartan-II devices include two tiers of global routing resources referred to as primary and secondary global routing resources.

- The primary global routing resources are four dedicated global nets with dedicated input pins that are designed to distribute high-fanout clock signals with minimal skew. Each global clock net can drive all CLB, IOB, and block RAM clock pins. The primary global nets may only be driven by global buffers. There are four global buffers, one for each global net.
- The secondary global routing resources consist of 24 backbone lines, 12 across the top of the chip and 12 across bottom. From these lines, up to 12 unique signals per column can be distributed via the 12 longlines in the column. These secondary resources are more flexible than the primary resources since they are not restricted to routing only to clock pins.

Figure 7: BUFT Connections to Dedicated Horizontal Bus Lines

Clock Distribution

The Spartan-II family provides high-speed, low-skew clock distribution through the primary global routing resources described above. A typical clock distribution net is shown in Figure 8.

Four global buffers are provided, two at the top center of the device and two at the bottom center. These drive the four primary global nets that in turn drive any clock pin.

Four dedicated clock pads are provided, one adjacent to each of the global buffers. The input to the global buffer is selected either from these pads or from signals in the general purpose routing. Global clock pins do not have the option for internal, weak pull-up resistors.

Figure 8: Global Clock Distribution Network

Delay-Locked Loop (DLL)

Associated with each global clock input buffer is a fully digital Delay-Locked Loop (DLL) that can eliminate skew between the clock input pad and internal clock-input pins throughout the device. Each DLL can drive two global clock networks. The DLL monitors the input clock and the distributed clock, and automatically adjusts a clock delay element. Additional delay is introduced such that clock edges reach internal flip-flops exactly one clock period after they arrive at the input. This closed-loop system effectively eliminates clock-distribution delay by ensuring that clock edges arrive at internal flip-flops in synchronism with clock edges arriving at the input.

In addition to eliminating clock-distribution delay, the DLL provides advanced control of multiple clock domains. The DLL provides four quadrature phases of the source clock, can double the clock, or divide the clock by 1.5, 2, 2.5, 3, 4, 5, 8, or 16. It has six outputs.

The DLL also operates as a clock mirror. By driving the output from a DLL off-chip and then back on again, the DLL can be used to deskew a board level clock among multiple Spartan-II devices.

In order to guarantee that the system clock is operating correctly prior to the FPGA starting up after configuration, the DLL can delay the completion of the configuration process until after it has achieved lock.

Boundary Scan

Spartan-II devices support all the mandatory boundaryscan instructions specified in the IEEE standard 1149.1. A Test Access Port (TAP) and registers are provided that implement the EXTEST, SAMPLE/PRELOAD, and BYPASS instructions. The TAP also supports two USERCODE instructions and internal scan chains.

The TAP uses dedicated package pins that always operate using LVTTL. For TDO to operate using LVTTL, the V_{CCO} for Bank 2 must be 3.3V. Otherwise, TDO switches rail-to-rail between ground and V_{CCO}. TDI, TMS, and TCK have a default internal weak pull-up resistor, and TDO has no default resistor. Bitstream options allow setting any of the four TAP pins to have an internal pull-up, pull-down, or neither.

DS001_16_032300

Symbol		Description		Units
T _{DCC}		DIN setup	5	ns, min
T _{CCD}		DIN hold	0	ns, min
т _{ссо}		DOUT	12	ns, max
т _{ссн}	COLK	High time	5	ns, min
T _{CCL}		Low time	5	ns, min
F _{CC}		Maximum frequency	66	MHz, max

Figure 16: Slave Serial Mode Timing

division factor N except for non-integer division in High Frequency (HF) mode. For division factor 1.5 the duty cycle in the HF mode is 33.3% High and 66.7% Low. For division factor 2.5, the duty cycle in the HF mode is 40.0% High and 60.0% Low.

1x Clock Outputs — CLK[0/90/180/270]

The 1x clock output pin CLK0 represents a delay-compensated version of the source clock (CLKIN) signal. The CLKDLL primitive provides three phase-shifted versions of the CLK0 signal while CLKDLLHF provides only the 180 degree phase-shifted version. The relationship between phase shift and the corresponding period shift appears in Table 10.

The timing diagrams in Figure 26 illustrate the DLL clock output characteristics.

Table 10: Relationship of Phase-Shifted Output Clock to Period Shift

Phase (degrees)	Period Shift (percent)
0	0%
90	25%
180	50%
270	75%

The DLL provides duty cycle correction on all 1x clock outputs such that all 1x clock outputs by default have a 50/50 duty cycle. The DUTY_CYCLE_CORRECTION property (TRUE by default), controls this feature. In order to deactivate the DLL duty cycle correction, attach the DUTY_CYCLE_CORRECTION=FALSE property to the DLL primitive. When duty cycle correction deactivates, the output clock has the same duty cycle as the source clock.

The DLL clock outputs can drive an OBUF, a BUFG, or they can route directly to destination clock pins. The DLL clock outputs can only drive the BUFGs that reside on the same edge (top or bottom).

Locked Output — LOCKED

In order to achieve lock, the DLL may need to sample several thousand clock cycles. After the DLL achieves lock the LOCKED signal activates. The "DLL Timing Parameters" section of Module 3 provides estimates for locking times.

In order to guarantee that the system clock is established prior to the device "waking up," the DLL can delay the completion of the device configuration process until after the DLL locks. The STARTUP_WAIT property activates this feature.

Until the LOCKED signal activates, the DLL output clocks are not valid and can exhibit glitches, spikes, or other

spurious movement. In particular the CLK2X output will appear as a 1x clock with a 25/75 duty cycle.

DLL Properties

Properties provide access to some of the Spartan-II family DLL features, (for example, clock division and duty cycle correction).

Duty Cycle Correction Property

The 1x clock outputs, CLK0, CLK90, CLK180, and CLK270, use the duty-cycle corrected default, such that they exhibit a 50/50 duty cycle. The DUTY_CYCLE_CORRECTION property (by default TRUE) controls this feature. To deactivate the DLL duty-cycle correction for the 1x clock outputs, attach the DUTY_CYCLE_CORRECTION=FALSE property to the DLL primitive.

Figure 26: DLL Output Characteristics

Clock Divide Property

The CLKDV_DIVIDE property specifies how the signal on the CLKDV pin is frequency divided with respect to the CLK0 pin. The values allowed for this property are 1.5, 2, 2.5, 3, 4, 5, 8, or 16; the default value is 2.

Figure 33: Timing Diagram for Single-Port Block RAM Memory

Figure 34: Timing Diagram for a True Dual-Port Read/Write Block RAM Memory

support of a wide variety of applications, from general purpose standard applications to high-speed low-voltage memory busses.

Versatile I/O blocks also provide selectable output drive strengths and programmable slew rates for the LVTTL output buffers, as well as an optional, programmable weak pull-up, weak pull-down, or weak "keeper" circuit ideal for use in external bussing applications.

Each Input/Output Block (IOB) includes three registers, one each for the input, output, and 3-state signals within the IOB. These registers are optionally configurable as either a D-type flip-flop or as a level sensitive latch.

The input buffer has an optional delay element used to guarantee a zero hold time requirement for input signals registered within the IOB.

The Versatile I/O features also provide dedicated resources for input reference voltage (V_{REF}) and output source voltage (V_{CCO}), along with a convenient banking system that simplifies board design.

By taking advantage of the built-in features and wide variety of I/O standards supported by the Versatile I/O features, system-level design and board design can be greatly simplified and improved.

Fundamentals

Modern bus applications, pioneered by the largest and most influential companies in the digital electronics industry, are commonly introduced with a new I/O standard tailored specifically to the needs of that application. The bus I/O standards provide specifications to other vendors who create products designed to interface with these applications. Each standard often has its own specifications for current, voltage, I/O buffering, and termination techniques.

The ability to provide the flexibility and time-to-market advantages of programmable logic is increasingly dependent on the capability of the programmable logic device to support an ever increasing variety of I/O standards

The Versatile I/O resources feature highly configurable input and output buffers which provide support for a wide variety of I/O standards. As shown in Table 15, each buffer type can support a variety of voltage requirements.

Table 15: Versatile I/O Supported Standards (Typical Values)

I/O Standard	Input Reference Voltage (V _{REF})	Output Source Voltage (V _{CCO})	Board Termination Voltage (V _{TT})
LVTTL (2-24 mA)	N/A	3.3	N/A
LVCMOS2	N/A	2.5	N/A
PCI (3V/5V, 33 MHz/66 MHz)	N/A	3.3	N/A
GTL	0.8	N/A	1.2
GTL+	1.0	N/A	1.5
HSTL Class I	0.75	1.5	0.75
HSTL Class III	0.9	1.5	1.5
HSTL Class IV	0.9	1.5	1.5
SSTL3 Class I and II	1.5	3.3	1.5
SSTL2 Class I and II	1.25	2.5	1.25
СТТ	1.5	3.3	1.5
AGP-2X	1.32	3.3	N/A

Overview of Supported I/O Standards

This section provides a brief overview of the I/O standards supported by all Spartan-II devices.

While most I/O standards specify a range of allowed voltages, this document records typical voltage values only. Detailed information on each specification may be found on the Electronic Industry Alliance JEDEC website at http://www.jedec.org. For more details on the I/O standards and termination application examples, see XAPP179, "Using SelectIO Interfaces in Spartan-II and Spartan-IIE FPGAs."

LVTTL — Low-Voltage TTL

The Low-Voltage TTL (LVTTL) standard is a general purpose EIA/JESDSA standard for 3.3V applications that uses an LVTTL input buffer and a Push-Pull output buffer. This standard requires a 3.3V output source voltage (V_{CCO}), but does not require the use of a reference voltage (V_{REF}) or a termination voltage (V_{TT}).

LVCMOS2 — Low-Voltage CMOS for 2.5V

The Low-Voltage CMOS for 2.5V or lower (LVCMOS2) standard is an extension of the LVCMOS standard (JESD 8.5) used for general purpose 2.5V applications. This standard requires a 2.5V output source voltage (V_{CCO}), but does not require the use of a reference voltage (V_{REF}) or a board termination voltage (V_{TT}).

IOBUF_<slew_rate>_<drive_strength>

<slew_rate> can be either F (Fast), or S (Slow) and <drive_strength> is specified in milliamps (2, 4, 6, 8, 12, 16, or 24).

When the IOBUF primitive supports an I/O standard such as LVTTL, LVCMOS, or PCI33_5, the IBUF automatically configures as a 5V tolerant input buffer unless the V_{CCO} for the bank is less than 2V. If the single-ended IBUF is placed in a bank with an HSTL standard (V_{CCO} < 2V), the input buffer is not 5V tolerant.

The voltage reference signal is "banked" within the Spartan-II device on a half-edge basis such that for all packages there are eight independent V_{REF} banks internally. See Figure 36, page 39 for a representation of the Spartan-II FPGA I/O banks. Within each bank approximately one of every six I/O pins is automatically configured as a V_{REF} input.

Additional restrictions on the Versatile I/O IOBUF placement require that within a given V_{CCO} bank each IOBUF must share the same output source drive voltage. Input buffers of any type and output buffers that do not require V_{CCO} can be placed within the same V_{CCO} bank. The LOC property can specify a location for the IOBUF.

An optional delay element is associated with the input path in each IOBUF. When the IOBUF drives an input flip-flop within the IOB, the delay element activates by default to ensure a zero hold-time requirement. Override this default with the NODELAY=TRUE property.

In the case when the IOBUF does not drive an input flip-flop within the IOB, the delay element de-activates by default to provide higher performance. To delay the input signal, activate the delay element with the DELAY=TRUE property.

3-state output buffers and bidirectional buffers can have either a weak pull-up resistor, a weak pull-down resistor, or a weak "keeper" circuit. Control this feature by adding the appropriate primitive to the output net of the IOBUF (PULLUP, PULLDOWN, or KEEPER).

Versatile I/O Properties

Access to some of the Versatile I/O features (for example, location constraints, input delay, output drive strength, and slew rate) is available through properties associated with these features.

Input Delay Properties

An optional delay element is associated with each IBUF. When the IBUF drives a flip-flop within the IOB, the delay element activates by default to ensure a zero hold-time requirement. Use the NODELAY=TRUE property to override this default.

In the case when the IBUF does not drive a flip-flop within the IOB, the delay element by default de-activates to provide higher performance. To delay the input signal, activate the delay element with the DELAY=TRUE property.

IOB Flip-Flop/Latch Property

The I/O Block (IOB) includes an optional register on the input path, an optional register on the output path, and an optional register on the 3-state control pin. The design implementation software automatically takes advantage of these registers when the following option for the Map program is specified:

map -pr b <filename>

Alternatively, the IOB = TRUE property can be placed on a register to force the mapper to place the register in an IOB.

Location Constraints

Specify the location of each Versatile I/O primitive with the location constraint LOC attached to the Versatile I/O primitive. The external port identifier indicates the value of the location constrain. The format of the port identifier depends on the package chosen for the specific design.

The LOC properties use the following form:

LOC=A42 LOC=P37

Output Slew Rate Property

In the case of the LVTTL output buffers (OBUF, OBUFT, and IOBUF), slew rate control can be programmed with the SLEW= property. By default, the slew rate for each output buffer is reduced to minimize power bus transients when switching non-critical signals. The SLEW= property has one of the two following values.

SLEW=SLOW

SLEW=FAST

Output Drive Strength Property

For the LVTTL output buffers (OBUF, OBUFT, and IOBUF, the desired drive strength can be specified with the DRIVE=

XILINX[®]

LVTTL

LVTTL requires no termination. DC voltage specifications appears in Table 32 for the LVTTL standard. See "DC Specifications" in Module 3 for the actual FPGA characteristics.

Parameter	Min	Тур	Max
V _{CCO}	3.0	3.3	3.6
V _{REF}	-	-	-
V _{TT}	-	-	-
V _{IH}	2.0	-	5.5
V _{IL}	-0.5	-	0.8
V _{OH}	2.4	-	-
V _{OL}	-	-	0.4
I _{OH} at V _{OH} (mA)	-24	-	-
I _{OL} at V _{OL} (mA)	24	-	-

Notes:

1. V_{OL} and V_{OH} for lower drive currents sample tested.

LVCMOS2

LVCMOS2 requires no termination. DC voltage specifications appear in Table 33 for the LVCMOS2 standard. See "DC Specifications" in Module 3 for the actual FPGA characteristics.

Table 33: LVCMOS2 Voltage Specifications

Parameter	Min	Тур	Max
V _{CCO}	2.3	2.5	2.7
V _{REF}	-	-	-
V _{TT}	-	-	-
V _{IH}	1.7	-	5.5
V _{IL}	-0.5	-	0.7
V _{OH}	1.9	-	-
V _{OL}	-	-	0.4
I _{OH} at V _{OH} (mA)	-12	-	-
I _{OL} at V _{OL} (mA)	12	-	-

AGP-2X

The specification for the AGP-2X standard does not document a recommended termination technique. DC voltage specifications appear in Table 34 for the AGP-2X standard. See "DC Specifications" in Module 3 for the actual FPGA characteristics.

Table 34: AGP-2X Voltage Specifications

Parameter	Min	Тур	Max
V _{CCO}	3.0	3.3	3.6
$V_{REF} = N \times V_{CCO}^{(1)}$	1.17	1.32	1.48
V _{TT}	-	-	-
$V_{IH} \ge V_{REF} + 0.2$	1.37	1.52	-
$V_{IL} \leq V_{REF} - 0.2$	-	1.12	1.28
$V_{OH} \ge 0.9 \times V_{CCO}$	2.7	3.0	-
$V_{OL} \le 0.1 \times V_{CCO}$	-	0.33	0.36
I _{OH} at V _{OH} (mA)	Note 2	-	-
I _{OL} at V _{OL} (mA)	Note 2	-	-

Notes:

For design examples and more information on using the I/O, see <u>XAPP179</u>, Using SelectIO Interfaces in Spartan-II and Spartan-IIE FPGAs.

^{1.} N must be greater than or equal to 0.39 and less than or equal to 0.41.

^{2.} Tested according to the relevant specification.

Recommended Operating Conditions

Symbol	Description		Min	Max	Units
Т _Ј	Junction temperature ⁽¹⁾	Commercial	0	85	°C
		Industrial	-40	100	°C
V _{CCINT}	Supply voltage relative to GND ^(2,5)	Commercial	2.5 – 5%	2.5 + 5%	V
		Industrial	2.5 – 5%	2.5 + 5%	V
V _{CCO}	Supply voltage relative to GND ^(3,5)	Commercial	1.4	3.6	V
		Industrial	1.4	3.6	V
T _{IN}	Input signal transition time ⁽⁴⁾	·	-	250	ns

Notes:

1. At junction temperatures above those listed as Operating Conditions, all delay parameters increase by 0.35% per °C.

2. Functional operation is guaranteed down to a minimum V_{CCINT} of 2.25V (Nominal V_{CCINT} – 10%). For every 50 mV reduction in V_{CCINT} below 2.375V (nominal V_{CCINT} – 5%), all delay parameters increase by 3%.

3. Minimum and maximum values for V_{CCO} vary according to the I/O standard selected.

4. Input and output measurement threshold is ~50% of V_{CCO}. See "Delay Measurement Methodology," page 60 for specific levels.

5. Supply voltages may be applied in any order desired.

DC Characteristics Over Operating Conditions

Symbol	Description			Min	Тур	Max	Units
V _{DRINT}	Data Retention V _{CCINT} voltage (below which configuration data may be lost)			2.0	-	-	V
V _{DRIO}	Data Retention V _{CCO} voltage (below v be lost)	which configu	ration data may	1.2	-	-	V
ICCINTQ	Quiescent V _{CCINT} supply current ⁽¹⁾	XC2S15	Commercial	-	10	30	mA
			Industrial	-	10	60	mA
		XC2S30	Commercial	-	10	30	mA
			Industrial	-	10	60	mA
		XC2S50	Commercial	-	12	50	mA
			Industrial	-	12	100	mA
		XC2S100	Commercial	-	12	50	mA
			Industrial	-	12	100	mA
		XC2S150	Commercial	-	15	50	mA
			Industrial	-	15	100	mA
		XC2S200	Commercial	-	15	75	mA
			Industrial	-	15	150	mA
ICCOQ	Quiescent V_{CCO} supply current ⁽¹⁾			-	-	2	mA
I _{REF}	V _{REF} current per V _{REF} pin			-	-	20	μΑ
١L	Input or output leakage current ⁽²⁾			-10	-	+10	μΑ
C _{IN}	Input capacitance (sample tested)	VQ, CS, TQ, PQ, FG packages		-	-	8	pF
I _{RPU}	Pad pull-up (when selected) @ $V_{IN} = 0V$, $V_{CCO} = 3.3V$ (sample tested) ⁽³⁾			-	-	0.25	mA
I _{RPD}	Pad pull-down (when selected) @ V_{I}	_N = 3.6V (sar	nple tested) ⁽³⁾	-	-	0.15	mA

Notes:

1. With no output current loads, no active input pull-up resistors, all I/O pins 3-stated and floating.

2. The I/O leakage current specification applies only when the V_{CCINT} and V_{CCO} supply voltages have reached their respective minimum Recommended Operating Conditions.

3. Internal pull-up and pull-down resistors guarantee valid logic levels at unconnected input pins. These pull-up and pull-down resistors do not provide valid logic levels when input pins are connected to other circuits.

Global Clock Setup and Hold for LVTTL Standard, with DLL (Pin-to-Pin)

			Speed Grade		
			-6	-5	
Symbol	Description	Device	Min	Min	Units
T _{PSDLL} / T _{PHDLL}	Input setup and hold time relative to global clock input signal for LVTTL standard, no delay, IFF, ⁽¹⁾ with DLL	All	1.7 / 0	1.9/0	ns

Notes:

1. IFF = Input Flip-Flop or Latch

2. Setup time is measured relative to the Global Clock input signal with the fastest route and the lightest load. Hold time is measured relative to the Global Clock input signal with the slowest route and heaviest load.

3. DLL output jitter is already included in the timing calculation.

4. A zero hold time listing indicates no hold time or a negative hold time.

 For data input with different standards, adjust the setup time delay by the values shown in "IOB Input Delay Adjustments for Different Standards," page 57. For a global clock input with standards other than LVTTL, adjust delays with values from the "I/O Standard Global Clock Input Adjustments," page 61.

Global Clock Setup and Hold for LVTTL Standard, without DLL (Pin-to-Pin)

			Speed	Grade	
			-6	-5	
Symbol	Description	Device	Min	Min	Units
T _{PSFD} / T _{PHFD} Input setup and hold time relative	XC2S15	2.2 / 0	2.7 / 0	ns	
	to global clock input signal for LVTTL standard, no delay, IFF, ⁽¹⁾ without DLL	XC2S30	2.2 / 0	2.7 / 0	ns
		XC2S50	2.2 / 0	2.7 / 0	ns
		XC2S100	2.3 / 0	2.8 / 0	ns
	XC2S150	2.4 / 0	2.9/0	ns	
		XC2S200	2.4 / 0	3.0 / 0	ns

Notes:

1. IFF = Input Flip-Flop or Latch

2. Setup time is measured relative to the Global Clock input signal with the fastest route and the lightest load. Hold time is measured relative to the Global Clock input signal with the slowest route and heaviest load.

3. A zero hold time listing indicates no hold time or a negative hold time.

4. For data input with different standards, adjust the setup time delay by the values shown in "IOB Input Delay Adjustments for Different Standards," page 57. For a global clock input with standards other than LVTTL, adjust delays with values from the "I/O Standard Global Clock Input Adjustments," page 61.

IOB Output Switching Characteristics

Output delays terminating at a pad are specified for LVTTL with 12 mA drive and fast slew rate. For other standards, adjust the delays with the values shown in "IOB Output Delay Adjustments for Different Standards," page 59.

		Speed Grade				
		-6		-5

Table 36: Spartan-II Family Package Options

Notes:

1. Package mass is $\pm 10\%$.

Note: Some early versions of Spartan-II devices, including the XC2S15 and XC2S30 ES devices and the XC2S150 with date code 0045 or earlier, included a power-down pin. For more information, see <u>Answer Record 10500</u>.

VCCO Banks

Some of the I/O standards require specific V_{CCO} voltages. These voltages are externally connected to device pins that serve groups of IOBs, called banks. Eight I/O banks result from separating each edge of the FPGA into two banks (see Figure 3 in Module 2). Each bank has multiple V_{CCO} pins which must be connected to the same voltage. In the smaller packages, the V_{CCO} pins are connected between banks, effectively reducing the number of independent banks available (see Table 37). These interconnected banks are shown in the Pinout Tables with V_{CCO} pads for multiple banks connected to the same pin.

Table 37: Independent VCCO Banks Available

Independent Banks	1	4	8

Package Overview

Table 36 shows the six low-cost, space-saving productionpackage styles for the Spartan-II family.

Each package style is available in an environmentally friendly lead-free (Pb-free) option. The Pb-free packages include an extra 'G' in the package style name. For example, the standard "CS144" package becomes "CSG144" when ordered as the Pb-free option. Leaded (non-Pb-free) packages may be available for selected devices, with the same pin-out and without the "G" in the ordering code; contact Xilinx sales for more information. The mechanical dimensions of the standard and Pb-free packages are similar, as shown in the mechanical drawings provided in Table 38. For additional package information, see <u>UG112</u>: *Device Package User Guide*.

Mechanical Drawings

Detailed mechanical drawings for each package type are available from the Xilinx web site at the specified location in Table 38.

Material Declaration Data Sheets (MDDS) are also available on the <u>Xilinx web site</u> for each package.

Revision History

Version	Date	Description
110.	Dute	Description
2.0	09/18/00	Sectioned the Spartan-II Family data sheet into four modules. Corrected all known errors in the pinout tables.
2.1	10/04/00	Added notes requiring PWDN to be tied to V _{CCINT} when unused.
2.2	11/02/00	Removed the Power Down feature.
2.3	03/05/01	Added notes on pinout tables for IRDY and TRDY.
2.4	04/30/01	Reinstated XC2S50 V _{CCO} Bank 7, GND, and "not connected" pins missing in version 2.3.
2.5	09/03/03	Added caution about Not Connected Pins to XC2S30 pinout tables on page 76.
2.8	06/13/08	Added "Package Overview" section. Added notes to clarify shared V _{CCO} banks. Updated description and links. Updated all modules for continuous page, figure, and table numbering. Synchronized all modules to v2.8.
