AMD Xilinx - XC2S30-5VQG100C Datasheet

Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

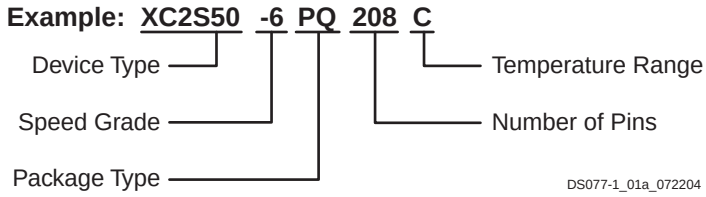
The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Active
Number of LABs/CLBs	216
Number of Logic Elements/Cells	972
Total RAM Bits	24576
Number of I/O	60
Number of Gates	30000
Voltage - Supply	2.375V ~ 2.625V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	100-TQFP
Supplier Device Package	100-VQFP (14x14)
Purchase URL	https://www.e-xfl.com/product-detail/xilinx/xc2s30-5vqg100c

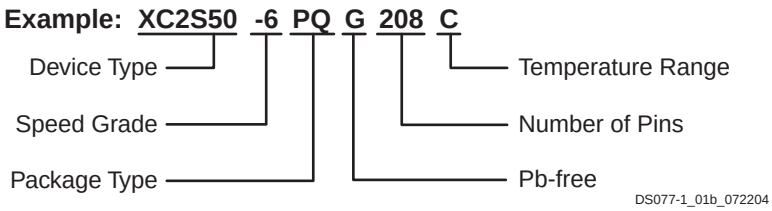
Ordering Information

Spartan-II devices are available in both standard and Pb-free packaging options for all device/package combinations. The Pb-free packages include a special "G" character in the ordering code.

Standard Packaging



Pb-Free Packaging



Device Ordering Options

Architectural Description

Spartan-II FPGA Array

The Spartan®-II field-programmable gate array, shown in Figure 2, is composed of five major configurable elements:

- IOBs provide the interface between the package pins and the internal logic
- CLBs provide the functional elements for constructing most logic
- Dedicated block RAM memories of 4096 bits each
- Clock DLLs for clock-distribution delay compensation and clock domain control
- Versatile multi-level interconnect structure

As can be seen in Figure 2, the CLBs form the central logic structure with easy access to all support and routing structures. The IOBs are located around all the logic and memory elements for easy and quick routing of signals on and off the chip.

Values stored in static memory cells control all the configurable logic elements and interconnect resources. These values load into the memory cells on power-up, and can reload if necessary to change the function of the device.

Each of these elements will be discussed in detail in the following sections.

Input/Output Block

The Spartan-II FPGA IOB, as seen in Figure 2, features inputs and outputs that support a wide variety of I/O signaling standards. These high-speed inputs and outputs are capable of supporting various state of the art memory and bus interfaces. Table 3 lists several of the standards which are supported along with the required reference, output and termination voltages needed to meet the standard.

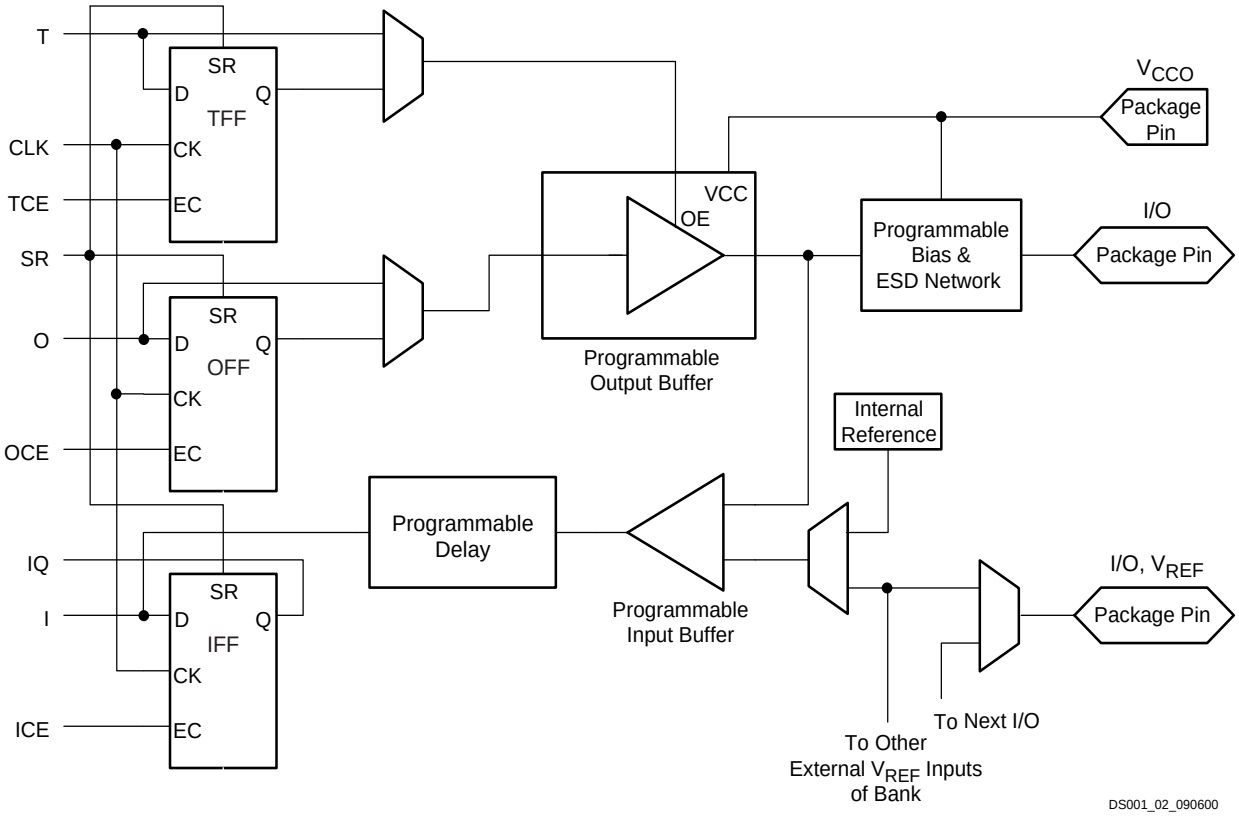

Figure 2: **Spartan-II FPGA Input/Output Block (IOB)**

The three IOB registers function either as edge-triggered D-type flip-flops or as level-sensitive latches. Each IOB has a clock signal (CLK) shared by the three registers and independent Clock Enable (CE) signals for each register. In addition to the CLK and CE control signals, the three registers share a Set/Reset (SR). For each register, this signal can be independently configured as a synchronous Set, a synchronous Reset, an asynchronous Preset, or an asynchronous Clear.

A feature not shown in the block diagram, but controlled by the software, is polarity control. The input and output buffers and all of the IOB control signals have independent polarity controls.

Optional pull-up and pull-down resistors and an optional weak-keeper circuit are attached to each pad. Prior to configuration all outputs not involved in configuration are forced into their high-impedance state. The pull-down resistors and the weak-keeper circuits are inactive, but inputs may optionally be pulled up.

Table 3: **Standards Supported by I/O (Typical Values)**

I/O Standard	Input Reference Voltage (V_{REF})	Output Source Voltage (V_{CCO})	Board Termination Voltage (V_{TT})
LVTTL (2-24 mA)	N/A	3.3	N/A
LVCMOS2	N/A	2.5	N/A
PCI (3V/5V, 33 MHz/66 MHz)	N/A	3.3	N/A
GTL	0.8	N/A	1.2
GTL+	1.0	N/A	1.5
HSTL Class I	0.75	1.5	0.75
HSTL Class III	0.9	1.5	1.5
HSTL Class IV	0.9	1.5	1.5
SSTL3 Class I and II	1.5	3.3	1.5
SSTL2 Class I and II	1.25	2.5	1.25
CTT	1.5	3.3	1.5
AGP-2X	1.32	3.3	N/A

The activation of pull-up resistors prior to configuration is controlled on a global basis by the configuration mode pins. If the pull-up resistors are not activated, all the pins will float. Consequently, external pull-up or pull-down resistors must be provided on pins required to be at a well-defined logic level prior to configuration.

All pads are protected against damage from electrostatic discharge (ESD) and from over-voltage transients. Two forms of over-voltage protection are provided, one that permits 5V compliance, and one that does not. For 5V compliance, a zener-like structure connected to ground turns on when the output rises to approximately 6.5V. When 5V compliance is not required, a conventional clamp diode may be connected to the output supply voltage, V_{CCO}. The type of over-voltage protection can be selected independently for each pad.

All Spartan-II FPGA IOBs support IEEE 1149.1-compatible boundary scan testing.

Input Path

A buffer In the Spartan-II FPGA IOB input path routes the input signal either directly to internal logic or through an optional input flip-flop.

An optional delay element at the D-input of this flip-flop eliminates pad-to-pad hold time. The delay is matched to the internal clock-distribution delay of the FPGA, and when used, assures that the pad-to-pad hold time is zero.

Each input buffer can be configured to conform to any of the low-voltage signaling standards supported. In some of these standards the input buffer utilizes a user-supplied threshold voltage, V_{REF}. The need to supply V_{REF} imposes constraints on which standards can used in close proximity to each other. See "I/O Banking," page 9.

There are optional pull-up and pull-down resistors at each input for use after configuration.

Output Path

The output path includes a 3-state output buffer that drives the output signal onto the pad. The output signal can be routed to the buffer directly from the internal logic or through an optional IOB output flip-flop.

The 3-state control of the output can also be routed directly from the internal logic or through a flip-flip that provides synchronous enable and disable.

Each output driver can be individually programmed for a wide range of low-voltage signaling standards. Each output buffer can source up to 24 mA and sink up to 48 mA. Drive strength and slew rate controls minimize bus transients.

In most signaling standards, the output high voltage depends on an externally supplied V_{CCO} voltage. The need to supply V_{CCO} imposes constraints on which standards can be used in close proximity to each other. See "I/O Banking".

An optional weak-keeper circuit is connected to each output. When selected, the circuit monitors the voltage on the pad and weakly drives the pin High or Low to match the input signal. If the pin is connected to a multiple-source signal, the weak keeper holds the signal in its last state if all

By default, these operations are synchronized to CCLK. The entire start-up sequence lasts eight cycles, called C0-C7, after which the loaded design is fully functional. The default timing for start-up is shown in the top half of Figure 13. The four operations can be selected to switch on any CCLK cycle C1-C6 through settings in the Xilinx software. Heavy lines show default settings.

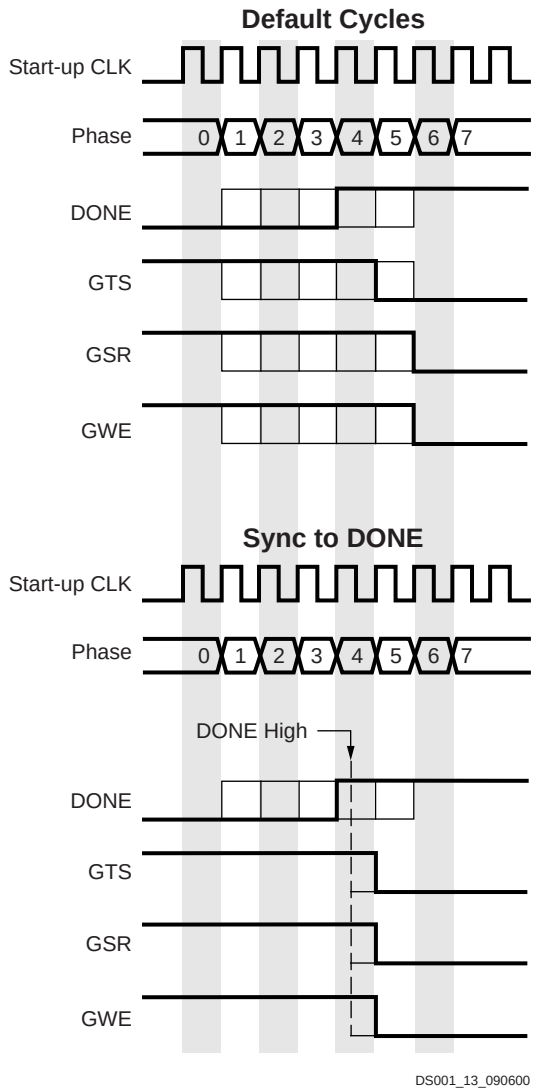

Figure 13: **Start-Up Waveforms**

The bottom half of Figure 13 shows another commonly used version of the start-up timing known as Sync-to-DONE. This version makes the GTS, GSR, and GWE events conditional upon the DONE pin going High. This timing is important for a daisy chain of multiple FPGAs in serial mode, since it ensures that all FPGAs go through start-up together, after all their DONE pins have gone High.

Sync-to-DONE timing is selected by setting the GTS, GSR, and GWE cycles to a value of DONE in the configuration options. This causes these signals to transition one clock cycle after DONE externally transitions High.

Serial Modes

There are two serial configuration modes: In Master Serial mode, the FPGA controls the configuration process by driving CCLK as an output. In Slave Serial mode, the FPGA passively receives CCLK as an input from an external agent (e.g., a microprocessor, CPLD, or second FPGA in master mode) that is controlling the configuration process. In both modes, the FPGA is configured by loading one bit per CCLK cycle. The MSB of each configuration data byte is always written to the DIN pin first.

See Figure 14 for the sequence for loading data into the Spartan-II FPGA serially. This is an expansion of the "Load Configuration Data Frames" block in Figure 11. Note that $\overline{CS}$ and $\overline{WRITE}$ normally are not used during serial configuration. To ensure successful loading of the FPGA, do not toggle $\overline{WRITE}$ with $\overline{CS}$ Low during serial configuration.

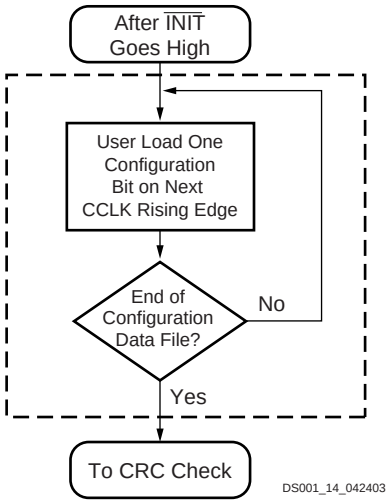

Figure 14: **Loading Serial Mode Configuration Data**

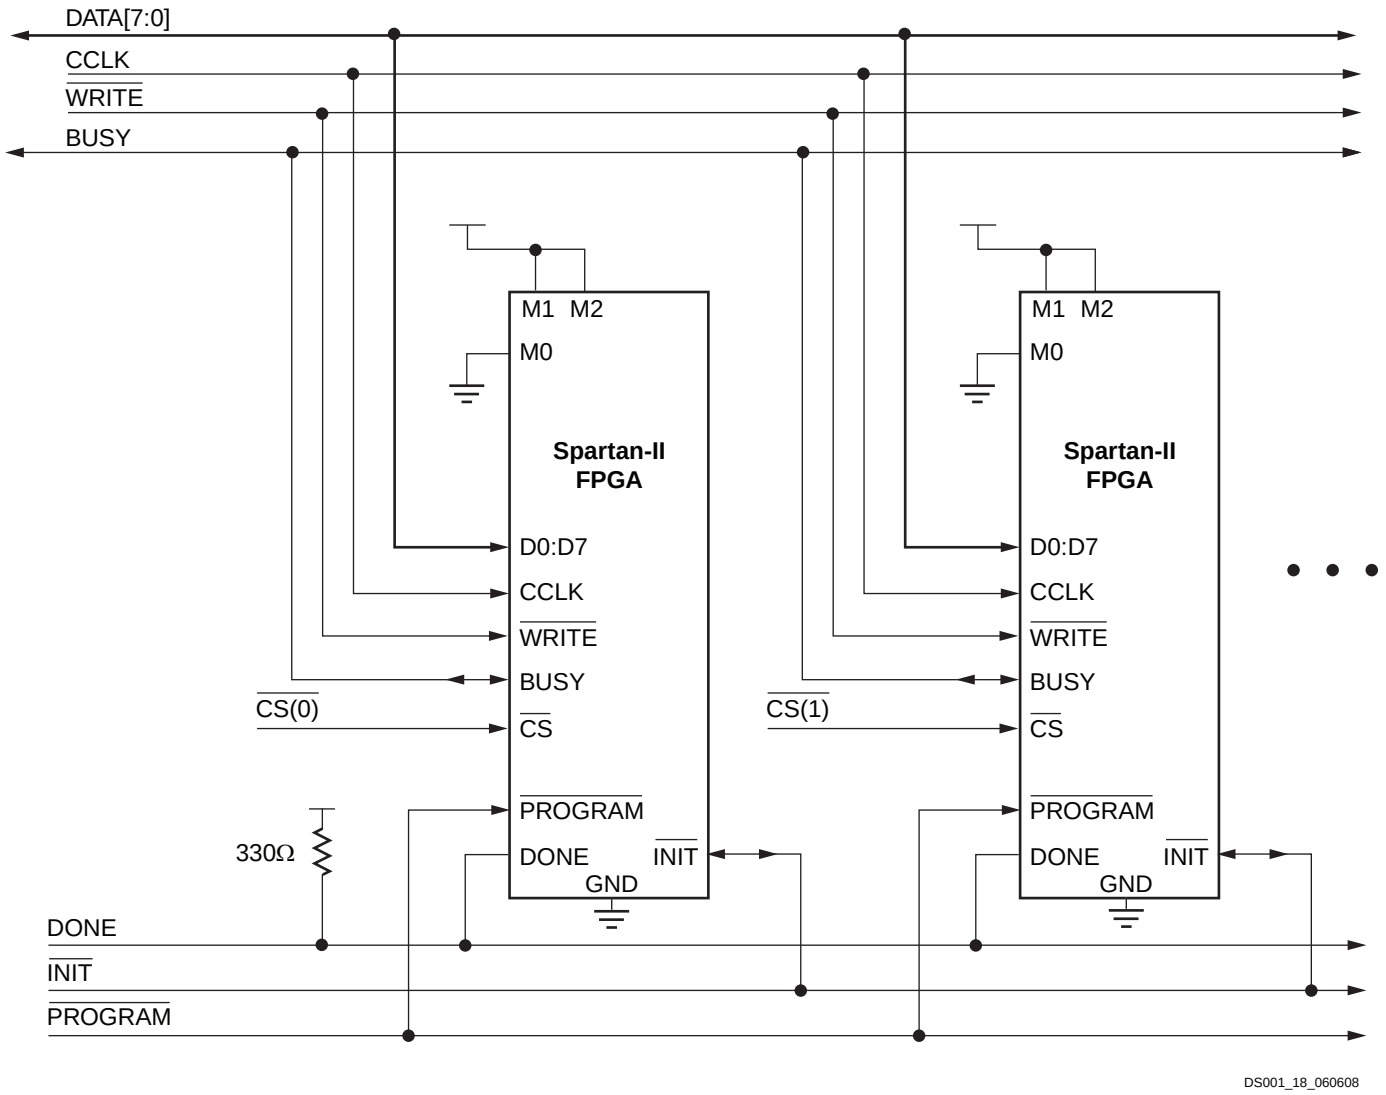

Figure 18: **Slave Parallel Configuration Circuit Diagram**

Multiple Spartan-II FPGAs can be configured using the Slave Parallel mode, and be made to start-up simultaneously. To configure multiple devices in this way, wire the individual CCLK, Data, $\overline{\text{WRITE}}$, and BUSY pins of all the devices in parallel. The individual devices are loaded separately by asserting the $\overline{\text{CS}}$ pin of each device in turn and writing the appropriate data. Sync-to-DONE start-up timing is used to ensure that the start-up sequence does not begin until all the FPGAs have been loaded. See "Start-up," page 19.

Write

When using the Slave Parallel Mode, write operations send packets of byte-wide configuration data into the FPGA. Figure 19, page 25 shows a flowchart of the write sequence used to load data into the Spartan-II FPGA. This is an expansion of the "Load Configuration Data Frames" block in Figure 11, page 18. The timing for write operations is shown in Figure 20, page 26.

For the present example, the user holds $\overline{\text{WRITE}}$ and $\overline{\text{CS}}$ Low throughout the sequence of write operations. Note that when $\overline{\text{CS}}$ is asserted on successive CCLKs, $\overline{\text{WRITE}}$ must remain either asserted or de-asserted. Otherwise an abort will be initiated, as in the next section.

1. Drive data onto D0-D7. Note that to avoid contention, the data source should not be enabled while $\overline{\text{CS}}$ is Low and $\overline{\text{WRITE}}$ is High. Similarly, while $\overline{\text{WRITE}}$ is High, no more than one device's $\overline{\text{CS}}$ should be asserted.
2. On the rising edge of CCLK: If BUSY is Low, the data is accepted on this clock. If BUSY is High (from a previous write), the data is not accepted. Acceptance will instead occur on the first clock after BUSY goes Low, and the data must be held until this happens.
3. Repeat steps 1 and 2 until all the data has been sent.
4. De-assert $\overline{\text{CS}}$ and $\overline{\text{WRITE}}$.

division factor N except for non-integer division in High Frequency (HF) mode. For division factor 1.5 the duty cycle in the HF mode is 33.3% High and 66.7% Low. For division factor 2.5, the duty cycle in the HF mode is 40.0% High and 60.0% Low.

1x Clock Outputs — CLK[0|90|180|270]

The 1x clock output pin CLK0 represents a delay-compensated version of the source clock (CLKIN) signal. The CLKDLL primitive provides three phase-shifted versions of the CLK0 signal while CLKDLLHF provides only the 180 degree phase-shifted version. The relationship between phase shift and the corresponding period shift appears in Table 10.

The timing diagrams in Figure 26 illustrate the DLL clock output characteristics.

Table 10: **Relationship of Phase-Shifted Output Clock to Period Shift**

Phase (degrees)	Period Shift (percent)
0	0%
90	25%
180	50%
270	75%

The DLL provides duty cycle correction on all 1x clock outputs such that all 1x clock outputs by default have a 50/50 duty cycle. The DUTY_CYCLE_CORRECTION property (TRUE by default), controls this feature. In order to deactivate the DLL duty cycle correction, attach the DUTY_CYCLE_CORRECTION=FALSE property to the DLL primitive. When duty cycle correction deactivates, the output clock has the same duty cycle as the source clock.

The DLL clock outputs can drive an OBUF, a BUFG, or they can route directly to destination clock pins. The DLL clock outputs can only drive the BUFGs that reside on the same edge (top or bottom).

Locked Output — LOCKED

In order to achieve lock, the DLL may need to sample several thousand clock cycles. After the DLL achieves lock the LOCKED signal activates. The "DLL Timing Parameters" section of Module 3 provides estimates for locking times.

In order to guarantee that the system clock is established prior to the device "waking up," the DLL can delay the completion of the device configuration process until after the DLL locks. The STARTUP_WAIT property activates this feature.

Until the LOCKED signal activates, the DLL output clocks are not valid and can exhibit glitches, spikes, or other spurious movement. In particular the CLK2X output will appear as a 1x clock with a 25/75 duty cycle.

DLL Properties

Properties provide access to some of the Spartan-II family DLL features, (for example, clock division and duty cycle correction).

Duty Cycle Correction Property

The 1x clock outputs, CLK0, CLK90, CLK180, and CLK270, use the duty-cycle corrected default, such that they exhibit a 50/50 duty cycle. The DUTY_CYCLE_CORRECTION property (by default TRUE) controls this feature. To deactivate the DLL duty-cycle correction for the 1x clock outputs, attach the DUTY_CYCLE_CORRECTION=FALSE property to the DLL primitive.

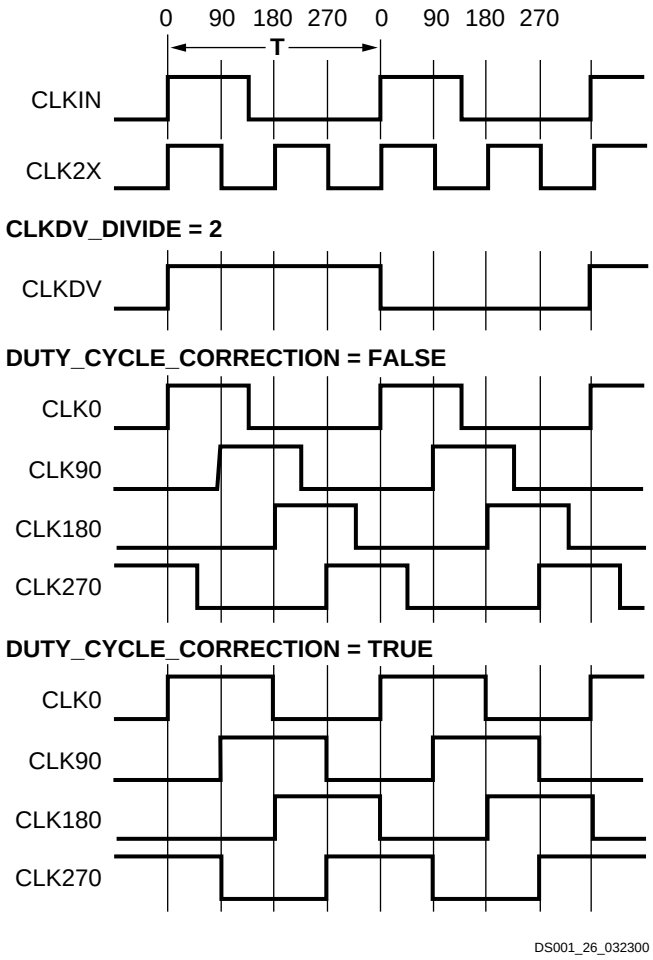

Figure 26: **DLL Output Characteristics**

Clock Divide Property

The CLKDV_DIVIDE property specifies how the signal on the CLKDV pin is frequency divided with respect to the CLK0 pin. The values allowed for this property are 1.5, 2, 2.5, 3, 4, 5, 8, or 16; the default value is 2.

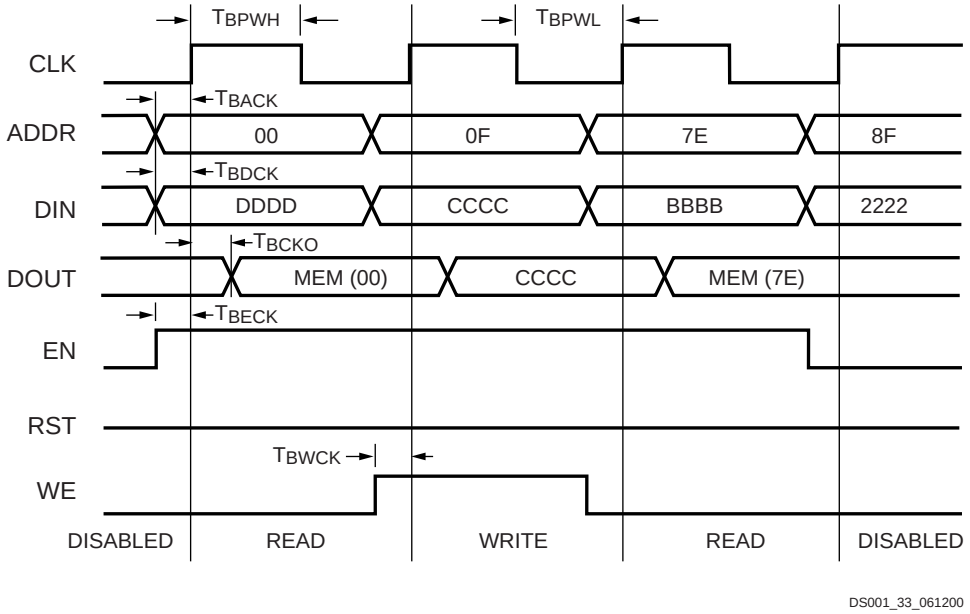

Figure 33: **Timing Diagram for Single-Port Block RAM Memory**

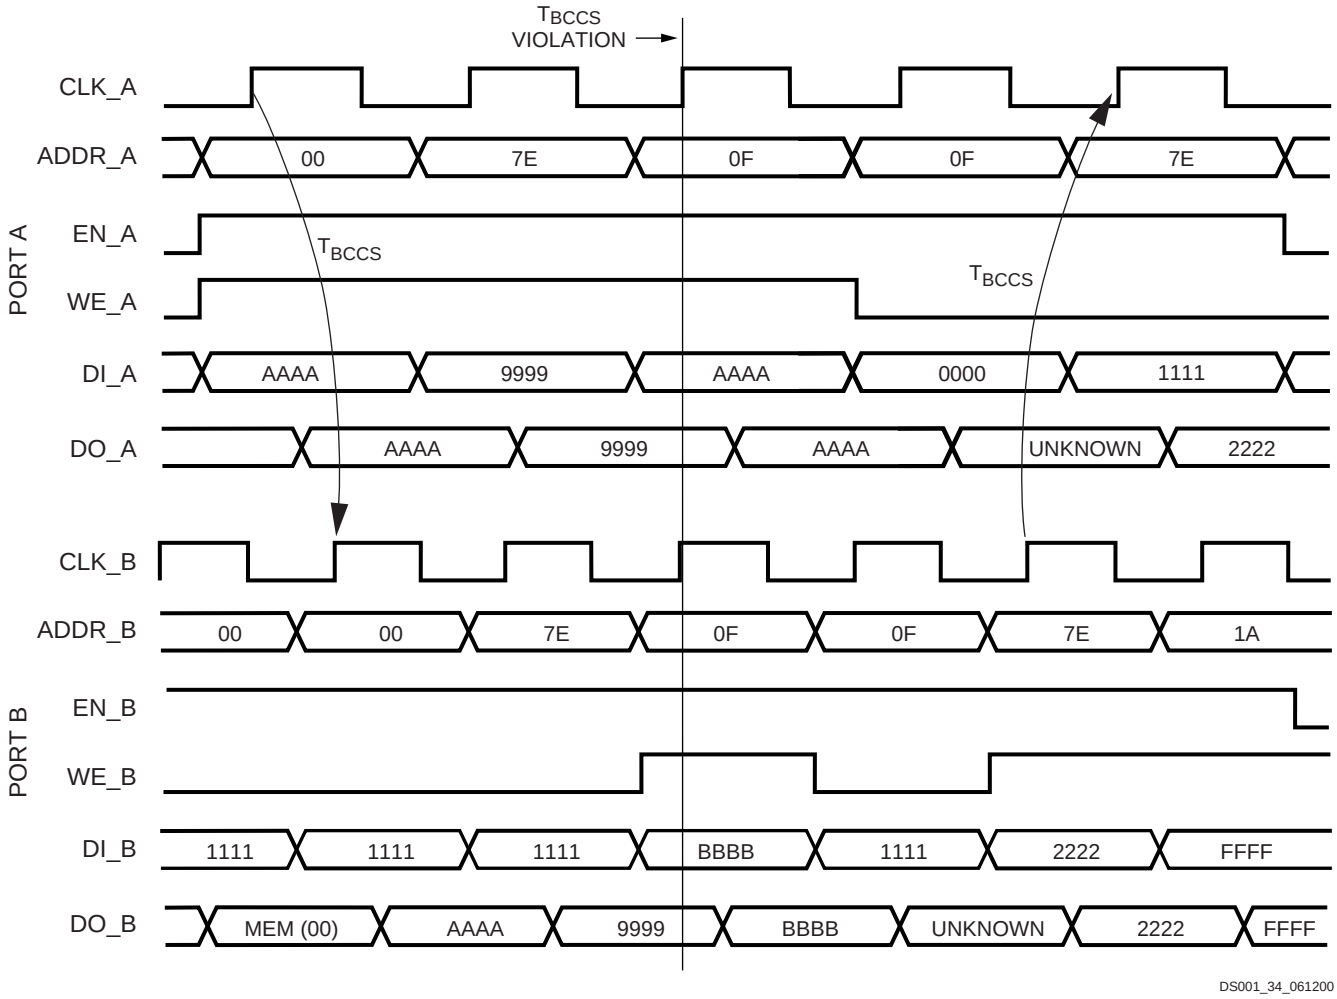

Figure 34: **Timing Diagram for a True Dual-Port Read/Write Block RAM Memory**

At the third rising edge of CLKA, the T_{BCCS} parameter is violated with two writes to memory location 0x0F. The DOA and DOB busses reflect the contents of the DIA and DIB busses, but the stored value at 0x7E is invalid.

At the fourth rising edge of CLKA, a read operation is performed at memory location 0x0F and invalid data is present on the DOA bus. Port B also executes a read operation to memory location 0x0F and also reads invalid data.

At the fifth rising edge of CLKA a read operation is performed that does not violate the T_{BCCS} parameter to the previous write of 0x7E by Port B. THe DOA bus reflects the recently written value by Port B.

Initialization

The block RAM memory can initialize during the device configuration sequence. The 16 initialization properties of 64 hex values each (a total of 4096 bits) set the initialization of each RAM. These properties appear in Table 14. Any initialization properties not explicitly set configure as zeros. Partial initialization strings pad with zeros. Initialization strings greater than 64 hex values generate an error. The RAMs can be simulated with the initialization values using generics in VHDL simulators and parameters in Verilog simulators.

Initialization in VHDL

The block RAM structures may be initialized in VHDL for both simulation and synthesis for inclusion in the EDIF output file. The simulation of the VHDL code uses a generic to pass the initialization.

Initialization in Verilog

The block RAM structures may be initialized in Verilog for both simulation and synthesis for inclusion in the EDIF output file. The simulation of the Verilog code uses a defparam to pass the initialization.

Block Memory Generation

The CORE Generator™ software generates memory structures using the block RAM features. This program outputs VHDL or Verilog simulation code templates and an EDIF file for inclusion in a design.

Table 14: **RAM Initialization Properties**

Property	Memory Cells
INIT_00	255 to 0
INIT_01	511 to 256
INIT_02	767 to 512
INIT_03	1023 to 768
INIT_04	1279 to 1024

INIT_0e	3839 to 3584
INIT_0f	4095 to 3840

For design examples and more information on using the Block RAM, see XAPP173, *Using Block SelectRAM+ Memory in Spartan-II FPGAs*.

Using Versatile I/O

The Spartan-II FPGA family includes a highly configurable, high-performance I/O resource called Versatile I/O to provide support for a wide variety of I/O standards. The Versatile I/O resource is a robust set of features including programmable control of output drive strength, slew rate, and input delay and hold time. Taking advantage of the flexibility and Versatile I/O features and the design considerations described in this document can improve and simplify system level design.

Introduction

As FPGAs continue to grow in size and capacity, the larger and more complex systems designed for them demand an increased variety of I/O standards. Furthermore, as system clock speeds continue to increase, the need for high-performance I/O becomes more important. While chip-to-chip delays have an increasingly substantial impact on overall system speed, the task of achieving the desired system performance becomes more difficult with the proliferation of low-voltage I/O standards. Versatile I/O, the revolutionary input/output resources of Spartan-II devices, has resolved this potential problem by providing a highly configurable, high-performance alternative to the I/O resources of more conventional programmable devices. The Spartan-II FPGA Versatile I/O features combine the flexibility and time-to-market advantages of programmable logic with the high performance previously available only with ASICs and custom ICs.

Each Versatile I/O block can support up to 16 I/O standards. Supporting such a variety of I/O standards allows the

LVTTL output buffers have selectable drive strengths.

The format for LVTTL OBUF primitive names is as follows.

OBUF_<slew_rate>_<drive_strength>

<slew_rate> is either F (Fast), or S (Slow) and <drive_strength> is specified in milliamps (2, 4, 6, 8, 12, 16, or 24). The default is slew rate limited with 12 mA drive.

OBUF placement restrictions require that within a given V_{CCO} bank each OBUF share the same output source drive voltage. Input buffers of any type and output buffers that do not require V_{CCO} can be placed within any V_{CCO} bank. Table 17 summarizes the output compatibility requirements. The LOC property can specify a location for the OBUF.

Table 17: **Output Standards Compatibility Requirements**

Rule 1	Only outputs with standards which share compatible V_{CCO} may be used within the same bank.
Rule 2	There are no placement restrictions for outputs with standards that do not require a V_{CCO}.
V_{CCO}	Compatible Standards
3.3	LVTTL, SSTL3_I, SSTL3_II, CTT, AGP, GTL, GTL+, PCI33_3, PCI66_3
2.5	SSTL2_I, SSTL2_II, LVCMOS2, GTL, GTL+
1.5	HSTL_I, HSTL_III, HSTL_IV, GTL, GTL+

OBUFT

The generic 3-state output buffer OBUFT, shown in Figure 39, typically implements 3-state outputs or bidirectional I/O.

With no extension or property specified for the generic OBUFT primitive, the assumed standard is slew rate limited LVTTL with 12 mA drive strength.

The LVTTL OBUFT can support one of two slew rate modes to minimize bus transients. By default, the slew rate for each output buffer is reduced to minimize power bus transients when switching non-critical signals.

LVTTL 3-state output buffers have selectable drive strengths.

The format for LVTTL OBUFT primitive names is as follows.

OBUFT_<slew_rate>_<drive_strength>

<slew_rate> can be either F (Fast), or S (Slow) and <drive_strength> is specified in milliamps (2, 4, 6, 8, 12, 16, or 24).

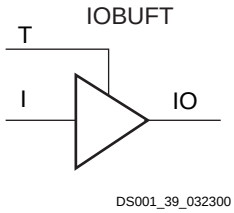

Figure 39: **3-State Output Buffer Primitive (OBUFT**

The Versatile I/O OBUFT placement restrictions require that within a given V_{CCO} bank each OBUFT share the same output source drive voltage. Input buffers of any type and output buffers that do not require V_{CCO} can be placed within the same V_{CCO} bank.

The LOC property can specify a location for the OBUFT.

3-state output buffers and bidirectional buffers can have either a weak pull-up resistor, a weak pull-down resistor, or a weak "keeper" circuit. Control this feature by adding the appropriate primitive to the output net of the OBUFT (PULLUP, PULLDOWN, or KEEPER).

The weak "keeper" circuit requires the input buffer within the IOB to sample the I/O signal. So, OBUFTs programmed for an I/O standard that requires a V_{REF} have automatic placement of a V_{REF} in the bank with an OBUFT configured with a weak "keeper" circuit. This restriction does not affect most circuit design as applications using an OBUFT configured with a weak "keeper" typically implement a bidirectional I/O. In this case the IBUF (and the corresponding V_{REF}) are explicitly placed.

The LOC property can specify a location for the OBUFT.

IOBUF

Use the IOBUF primitive for bidirectional signals that require both an input buffer and a 3-state output buffer with an active high 3-state pin. The generic input/output buffer IOBUF appears in Figure 40.

With no extension or property specified for the generic IOBUF primitive, the assumed standard is LVTTL input buffer and slew rate limited LVTTL with 12 mA drive strength for the output buffer.

The LVTTL IOBUF can support one of two slew rate modes to minimize bus transients. By default, the slew rate for each output buffer is reduced to minimize power bus transients when switching non-critical signals.

LVTTL bidirectional buffers have selectable output drive strengths.

The format for LVTTL IOBUF primitive names is as follows:

ground metallization. The IC internal ground level deviates from the external system ground level for a short duration (a few nanoseconds) after multiple outputs change state simultaneously.

Ground bounce affects stable Low outputs and all inputs because they interpret the incoming signal by comparing it to the internal ground. If the ground bounce amplitude exceeds the actual instantaneous noise margin, then a non-changing input can be interpreted as a short pulse with a polarity opposite to the ground bounce.

Table 18 provides the guidelines for the maximum number of simultaneously switching outputs allowed per output power/ground pair to avoid the effects of ground bounce. Refer to Table 19 for the number of effective output power/ground pairs for each Spartan-II device and package combination.

Table 18: **Maximum Number of Simultaneously Switching Outputs per Power/Ground Pair**

Standard	Package	
	CS, FG	PQ, TQ, VQ
LVTTL Slow Slew Rate, 2 mA drive	68	36
LVTTL Slow Slew Rate, 4 mA drive	41	20
LVTTL Slow Slew Rate, 6 mA drive	29	15
LVTTL Slow Slew Rate, 8 mA drive	22	12
LVTTL Slow Slew Rate, 12 mA drive	17	9
LVTTL Slow Slew Rate, 16 mA drive	14	7
LVTTL Slow Slew Rate, 24 mA drive	9	5

Termination Examples

Creating a design with the Versatile I/O features requires the instantiation of the desired library primitive within the design code. At the board level, designers need to know the termination techniques required for each I/O standard.

This section describes some common application examples illustrating the termination techniques recommended by each of the standards supported by the Versatile I/O features. For a full range of accepted values for the DC voltage specifications for each standard, refer to the table associated with each figure.

The resistors used in each termination technique example and the transmission lines depicted represent board level components and are not meant to represent components on the device.

SSTL2_I

A sample circuit illustrating a valid termination technique for SSTL2_I appears in Figure 49. DC voltage specifications appear in Table 27 for the SSTL2_I standard. See "DC Specifications" in Module 3 for the actual FPGA characteristics

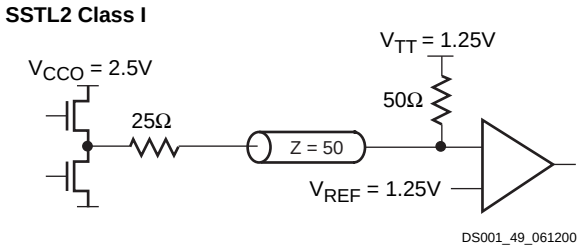

Figure 49: **Terminated SSTL2 Class I**

Table 27: **SSTL2_I Voltage Specifications**

Parameter	Min	Typ	Max
V_{CCO}	2.3	2.5	2.7
$V_{REF} = 0.5 \times V_{CCO}$	1.15	1.25	1.35
$V_{TT} = V_{REF} + N^{(1)}$	1.11	1.25	1.39
$V_{IH} \geq V_{REF} + 0.18$	1.33	1.43	$3.0^{(2)}$
$V_{IL} \leq V_{REF} - 0.18$	$-0.3^{(3)}$	1.07	1.17
$V_{OH} \geq V_{REF} + 0.61$	1.76	-	-
$V_{OL} \leq V_{REF} - 0.61$	-	-	0.74
I_{OH} at V_{OH} (mA)	–7.6	-	-
I_{OL} at V_{OL} (mA)	7.6	-	-

Notes:
1. N must be greater than or equal to –0.04 and less than or equal to 0.04.
2. V_{IH} maximum is V_{CCO} + 0.3.
3. V_{IL} minimum does not conform to the formula.

SSTL2 Class II

A sample circuit illustrating a valid termination technique for SSTL2_II appears in Figure 50. DC voltage specifications appear in Table 28 for the SSTL2_II standard. See "DC Specifications" in Module 3 for the actual FPGA characteristics.

2. V_{IH} maximum is V_{CCO} + 0.3.
3. V_{IL} minimum does not conform to the formula.

Revision History

Date	Version	Description
09/18/00	2.0	Sectioned the Spartan-II Family data sheet into four modules. Corrected banking description.
03/05/01	2.1	Clarified guidelines for applying power to V_{CCINT} and V_{CCO}
09/03/03	2.2	The following changes were made: • "Serial Modes," page 20 cautions about toggling $\overline{WRITE}$ during serial configuration. • Maximum V_{IH} values in Table 32 and Table 33 changed to 5.5V. • In "Boundary Scan," page 13, removed sentence about lack of INTEST support. • In Table 9, page 17, added note about the state of I/Os after power-on. • In "Slave Parallel Mode," page 23, explained configuration bit alignment to SelectMap port.
06/13/08	2.8	Added note that TDI, TMS, and TCK have a default pull-up resistor. Added note on maximum daisy chain limit. Updated Figure 15 and Figure 18 since Mode pins can be pulled up to either 2.5V or 3.3V. Updated DLL section. Recommended using property or attribute instead of primitive to define I/O properties. Updated description and links. Updated all modules for continuous page, figure, and table numbering. Synchronized all modules to v2.8.

Global Clock Setup and Hold for LVTTL Standard, *with* DLL (Pin-to-Pin)

Symbol	Description	Device	Speed Grade		Units
			-6	-5	
			Min	Min	
T_{PSDLL} / T_{PHDLL}	Input setup and hold time relative to global clock input signal for LVTTL standard, no delay, IFF,(1) with DLL	All	1.7 / 0	1.9 / 0	ns

Notes:
1. IFF = Input Flip-Flop or Latch
2. Setup time is measured relative to the Global Clock input signal with the fastest route and the lightest load. Hold time is measured relative to the Global Clock input signal with the slowest route and heaviest load.
3. DLL output jitter is already included in the timing calculation.
4. A zero hold time listing indicates no hold time or a negative hold time.
5. For data input with different standards, adjust the setup time delay by the values shown in "IOB Input Delay Adjustments for Different Standards," page 57. For a global clock input with standards other than LVTTL, adjust delays with values from the "I/O Standard Global Clock Input Adjustments," page 61.

Global Clock Setup and Hold for LVTTL Standard, *without* DLL (Pin-to-Pin)

Symbol	Description	Device	Speed Grade		Units
			-6	-5	
			Min	Min	
T_{PSFD} / T_{PHFD}	Input setup and hold time relative to global clock input signal for LVTTL standard, no delay, IFF,(1) without DLL	XC2S15	2.2 / 0	2.7 / 0	ns
		XC2S30	2.2 / 0	2.7 / 0	ns
		XC2S50	2.2 / 0	2.7 / 0	ns
		XC2S100	2.3 / 0	2.8 / 0	ns
		XC2S150	2.4 / 0	2.9 / 0	ns
		XC2S200	2.4 / 0	3.0 / 0	ns

Notes:
1. IFF = Input Flip-Flop or Latch
2. Setup time is measured relative to the Global Clock input signal with the fastest route and the lightest load. Hold time is measured relative to the Global Clock input signal with the slowest route and heaviest load.
3. A zero hold time listing indicates no hold time or a negative hold time.
4. For data input with different standards, adjust the setup time delay by the values shown in "IOB Input Delay Adjustments for Different Standards," page 57. For a global clock input with standards other than LVTTL, adjust delays with values from the "I/O Standard Global Clock Input Adjustments," page 61.

CLB Switching Characteristics

Delays originating at F/G inputs vary slightly according to the input used. The values listed below are worst-case. Precise values are provided by the timing analyzer.

Symbol	Description	Speed Grade				Units
		-6		-5		
		Min	Max	Min	Max	
Combinatorial Delays						
T_{ILO}	4-input function: F/G inputs to X/Y outputs	-	0.6	-	0.7	ns
T_{IF5}	5-input function: F/G inputs to F5 output	-	0.7	-	0.9	ns
T_{IF5X}	5-input function: F/G inputs to X output	-	0.9	-	1.1	ns
T_{IF6Y}	6-input function: F/G inputs to Y output via F6 MUX	-	1.0	-	1.1	ns
T_{F5INY}	6-input function: F5IN input to Y output	-	0.4	-	0.4	ns
T_{IFNCTL}	Incremental delay routing through transparent latch to XQ/YQ outputs	-	0.7	-	0.9	ns
T_{BYYB}	BY input to YB output	-	0.6	-	0.7	ns
Sequential Delays						
T_{CKO}	FF clock CLK to XQ/YQ outputs	-	1.1	-	1.3	ns
T_{CKLO}	Latch clock CLK to XQ/YQ outputs	-	1.2	-	1.5	ns
Setup/Hold Times with Respect to Clock CLK (1)						
T_{ICK} / T_{CKI}	4-input function: F/G inputs	1.3 / 0	-	1.4 / 0	-	ns
T_{IF5CK} / T_{CKIF5}	5-input function: F/G inputs	1.6 / 0	-	1.8 / 0	-	ns
T_{F5INCK} / T_{CKF5IN}	6-input function: F5IN input	1.0 / 0	-	1.1 / 0	-	ns
T_{IF6CK} / T_{CKIF6}	6-input function: F/G inputs via F6 MUX	1.6 / 0	-	1.8 / 0	-	ns
T_{DICK} / T_{CKDI}	BX/BY inputs	0.8 / 0	-	0.8 / 0	-	ns
T_{CECK} / T_{CKCE}	CE input	0.9 / 0	-	0.9 / 0	-	ns
T_{RCK} / T_{CKR}	SR/BY inputs (synchronous)	0.8 / 0	-	0.8 / 0	-	ns
Clock CLK						
T_{CH}	Minimum pulse width, High	-	1.9	-	1.9	ns
T_{CL}	Minimum pulse width, Low	-	1.9	-	1.9	ns
Set/Reset						
T_{RPW}	Minimum pulse width, SR/BY inputs	3.1	-	3.1	-	ns
T_{RQ}	Delay from SR/BY inputs to XQ/YQ outputs (asynchronous)	-	1.1	-	1.3	ns
T_{IOGSRQ}	Delay from GSR to XQ/YQ outputs	-	9.9	-	11.7	ns
F_{TOG}	Toggle frequency (for export control)	-	263	-	263	MHz

Notes:
1. A zero hold time listing indicates no hold time or a negative hold time.

Block RAM Switching Characteristics

Symbol	Description	Speed Grade				Units
		-6		-5		
		Min	Max	Min	Max	
Sequential Delays						
T_{BCKO}	Clock CLK to DOUT output	-	3.4	-	4.0	ns
Setup/Hold Times with Respect to Clock CLK (1)						
T_{BACK} / T_{BCKA}	ADDR inputs	1.4 / 0	-	1.4 / 0	-	ns
T_{BDCK}/ T_{BCKD}	DIN inputs	1.4 / 0	-	1.4 / 0	-	ns
T_{BECK}/ T_{BCKE}	EN inputs	2.9 / 0	-	3.2 / 0	-	ns
T_{BRCK}/ T_{BCKR}	RST input	2.7 / 0	-	2.9 / 0	-	ns
T_{BWCK}/ T_{BCKW}	WEN input	2.6 / 0	-	2.8 / 0	-	ns
Clock CLK						
T_{BPWH}	Minimum pulse width, High	-	1.9	-	1.9	ns
T_{BPWL}	Minimum pulse width, Low	-	1.9	-	1.9	ns
T_{BCCS}	CLKA -> CLKB setup time for different ports	-	3.0	-	4.0	ns

Notes:
1. A zero hold time listing indicates no hold time or a negative hold time.

TBUF Switching Characteristics

Symbol	Description	Speed Grade		Units
		-6	-5	
		Max	Max	
Combinatorial Delays				
T_{IO}	IN input to OUT output	0	0	ns
T_{OFF}	TRI input to OUT output high impedance	0.1	0.2	ns
T_{ON}	TRI input to valid data on OUT output	0.1	0.2	ns

JTAG Test Access Port Switching Characteristics

Symbol	Description	Speed Grade				Units
		-6		-5		
		Min	Max	Min	Max	
Setup and Hold Times with Respect to TCK						
T_{TAPTCK} / T_{TCKTAP}	TMS and TDI setup and hold times	4.0 / 2.0	-	4.0 / 2.0	-	ns
Sequential Delays						
T_{TCKTDO}	Output delay from clock TCK to output TDO	-	11.0	-	11.0	ns
FTCK	Maximum TCK clock frequency	-	33	-	33	MHz

Introduction

This section describes how the various pins on a Spartan®-II FPGA connect within the supported component packages, and provides device-specific thermal characteristics. Spartan-II FPGAs are available in both standard and Pb-free, RoHS versions of each package, with the Pb-free version adding a “G” to the middle of the package code. Except for the thermal characteristics, all information for the standard package applies equally to the Pb-free package.

Pin Types

Most pins on a Spartan-II FPGA are general-purpose, user-defined I/O pins. There are, however, different functional types of pins on Spartan-II FPGA packages, as outlined in Table 35.

Table 35: **Pin Definitions**

Pin Name	Dedicated	Direction	Description
GCK0, GCK1, GCK2, GCK3	No	Input	Clock input pins that connect to Global Clock Buffers. These pins become user inputs when not needed for clocks.
M0, M1, M2	Yes	Input	Mode pins are used to specify the configuration mode.
CCLK	Yes	Input or Output	The configuration Clock I/O pin. It is an input for slave-parallel and slave-serial modes, and output in master-serial mode.
$\overline{\text{PROGRAM}}$	Yes	Input	Initiates a configuration sequence when asserted Low.
DONE	Yes	Bidirectional	Indicates that configuration loading is complete, and that the start-up sequence is in progress. The output may be open drain.
$\overline{\text{INIT}}$	No	Bidirectional (Open-drain)	When Low, indicates that the configuration memory is being cleared. This pin becomes a user I/O after configuration.
BUSY/DOUT	No	Output	In Slave Parallel mode, BUSY controls the rate at which configuration data is loaded. This pin becomes a user I/O after configuration unless the Slave Parallel port is retained. In serial modes, DOUT provides configuration data to downstream devices in a daisy-chain. This pin becomes a user I/O after configuration.
D0/DIN, D1, D2, D3, D4, D5, D6, D7	No	Input or Output	In Slave Parallel mode, D0-D7 are configuration data input pins. During readback, D0-D7 are output pins. These pins become user I/Os after configuration unless the Slave Parallel port is retained. In serial modes, DIN is the single data input. This pin becomes a user I/O after configuration.
$\overline{\text{WRITE}}$	No	Input	In Slave Parallel mode, the active-low Write Enable signal. This pin becomes a user I/O after configuration unless the Slave Parallel port is retained.
$\overline{\text{CS}}$	No	Input	In Slave Parallel mode, the active-low Chip Select signal. This pin becomes a user I/O after configuration unless the Slave Parallel port is retained.
TDI, TDO, TMS, TCK	Yes	Mixed	Boundary Scan Test Access Port pins (IEEE 1149.1).
V_{CCINT}	Yes	Input	Power supply pins for the internal core logic.
V_{CCO}	Yes	Input	Power supply pins for output drivers (subject to banking rules)
V_{REF}	No	Input	Input threshold voltage pins. Become user I/Os when an external threshold voltage is not needed (subject to banking rules).
GND	Yes	Input	Ground.
IRDY, TRDY	No	See PCI core documentation	These signals can only be accessed when using Xilinx® PCI cores. If the cores are not used, these pins are available as user I/Os.

Table 36: **Spartan-II Family Package Options**

Package	Leads	Type	Maximum I/O	Lead Pitch (mm)	Footprint Area (mm)	Height (mm)	Mass[1] (g)
VQ100 / VQG100	100	Very Thin Quad Flat Pack (VQFP)	60	0.5	16 x 16	1.20	0.6
TQ144 / TQG144	144	Thin Quad Flat Pack (TQFP)	92	0.5	22 x 22	1.60	1.4
CS144 / CSG144	144	Chip Scale Ball Grid Array (CSBGA)	92	0.8	12 x 12	1.20	0.3
PQ208 / PQG208	208	Plastic Quad Flat Pack (PQFP)	140	0.5	30.6 x 30.6	3.70	5.3
FG256 / FGG256	256	Fine-pitch Ball Grid Array (FBGA)	176	1.0	17 x 17	2.00	0.9
FG456 / FGG456	456	Fine-pitch Ball Grid Array (FBGA)	284	1.0	23 x 23	2.60	2.2

Notes:

1. Package mass is ±10%.

Note: Some early versions of Spartan-II devices, including the XC2S15 and XC2S30 ES devices and the XC2S150 with date code 0045 or earlier, included a power-down pin. For more information, see Answer Record 10500.

VCCO Banks

Some of the I/O standards require specific V_{CCO} voltages. These voltages are externally connected to device pins that serve groups of IOBs, called banks. Eight I/O banks result from separating each edge of the FPGA into two banks (see Figure 3 in Module 2). Each bank has multiple V_{CCO} pins which must be connected to the same voltage. In the smaller packages, the V_{CCO} pins are connected between banks, effectively reducing the number of independent banks available (see Table 37). These interconnected banks are shown in the Pinout Tables with V_{CCO} pads for multiple banks connected to the same pin.

Table 37: **Independent VCCO Banks Available**

Package	VQ100 PQ208	CS144 TQ144	FG256 FG456
Independent Banks	1	4	8

Package Overview

Table 36 shows the six low-cost, space-saving production package styles for the Spartan-II family.

Each package style is available in an environmentally friendly lead-free (Pb-free) option. The Pb-free packages include an extra ‘G’ in the package style name. For example, the standard “CS144” package becomes “CSG144” when ordered as the Pb-free option. Leaded (non-Pb-free) packages may be available for selected devices, with the same pin-out and without the "G" in the ordering code; contact Xilinx sales for more information. The mechanical dimensions of the standard and Pb-free packages are similar, as shown in the mechanical drawings provided in Table 38.

For additional package information, see UG112: *Device Package User Guide*.

Mechanical Drawings

Detailed mechanical drawings for each package type are available from the Xilinx web site at the specified location in Table 38.

Material Declaration Data Sheets (MDDS) are also available on the Xilinx web site for each package.

11/02/00

Revision History

Version No.	Date	Description
2.0	09/18/00	Sectioned the Spartan-II Family data sheet into four modules. Corrected all known errors in the pinout tables.
2.1	10/04/00	Added notes requiring $\overline{PWDN}$ to be tied to V_{CCINT} when unused.
2.2	11/02/00	Removed the Power Down feature.
2.3	03/05/01	Added notes on pinout tables for IRDY and TRDY.
2.4	04/30/01	Reinstated XC2S50 V_{CCO} Bank 7, GND, and "not connected" pins missing in version 2.3.
2.5	09/03/03	Added caution about Not Connected Pins to XC2S30 pinout tables on page 76.
2.8	06/13/08	Added "Package Overview" section. Added notes to clarify shared V_{CCO} banks. Updated description and links. Updated all modules for continuous page, figure, and table numbering. Synchronized all modules to v2.8.
