Understanding Embedded - CPLDs (Complex Programmable Logic Devices)

Embedded - CPLDs, or Complex Programmable Logic Devices, are highly versatile digital logic devices used in electronic systems. These programmable components are designed to perform complex logical operations and can be customized for specific applications. Unlike fixed-function ICs, CPLDs offer the flexibility to reprogram their configuration, making them an ideal choice for various embedded systems. They consist of a set of logic gates and programmable interconnects, allowing designers to implement complex logic circuits without needing custom hardware.

Applications of Embedded - CPLDs

Details	
Product Status	Active
Programmable Type	In System Programmable
Delay Time tpd(1) Max	5.8 ns
Voltage Supply - Internal	1.7V ~ 1.9V
Number of Logic Elements/Blocks	4
Number of Macrocells	64
Number of Gates	-
Number of I/O	64
Operating Temperature	0°C ~ 90°C (TJ)
Mounting Type	Surface Mount
Package / Case	144-TFBGA, CSPBGA
Supplier Device Package	144-CSBGA (7x7)
Purchase URL	https://www.e-xfl.com/product-detail/lattice-semiconductor/lc4064ze-5mn144c

Product Term Allocator

The product term allocator assigns product terms from a cluster to either logic or control applications as required by the design being implemented. Product terms that are used as logic are steered into a 5-input OR gate associated with the cluster. Product terms that used for control are steered either to the macrocell or I/O cell associated with the cluster. Table 2 shows the available functions for each of the five product terms in the cluster.

Table 2. Individual PT Steering

Product Term	Logic	Control
PT*n*	Logic PT	Single PT for XOR/OR
PT*n*+1	Logic PT	Individual Clock (PT Clock)
PT*n*+2	Logic PT	Individual Initialization or Individual Clock Enable (PT Initialization/CE)
PT*n*+3	Logic PT	Individual Initialization (PT Initialization)
PT*n*+4	Logic PT	Individual OE (PTOE)

Cluster Allocator

The cluster allocator allows clusters to be steered to neighboring macrocells, thus allowing the creation of functions with more product terms. Table 3 shows which clusters can be steered to which macrocells. Used in this manner, the cluster allocator can be used to form functions of up to 20 product terms. Additionally, the cluster allocator accepts inputs from the wide steering logic. Using these inputs, functions up to 80 product terms can be created.

Table 3. Available Clusters for Each Macrocell

Macrocell	Available Clusters			
M0	—	C0	C1	C2
M1	C0	C1	C2	C3
M2	C1	C2	C3	C4
M3	C2	C3	C4	C5
M4	C3	C4	C5	C6
M5	C4	C5	C6	C7
M6	C5	C6	C7	C8
M7	C6	C7	C8	C9
M8	C7	C8	C9	C10
M9	C8	C9	C10	C11
M10	C9	C10	C11	C12
M11	C10	C11	C12	C13
M12	C11	C12	C13	C14
M13	C12	C13	C14	C15
M14	C13	C14	C15	—
M15	C14	C15	—	—

Wide Steering Logic

The wide steering logic allows the output of the cluster allocator n to be connected to the input of the cluster allocator *n*+4. Thus, cluster chains can be formed with up to 80 product terms, supporting wide product term functions and allowing performance to be increased through a single GLB implementation. Table 4 shows the product term chains.

Table 4. Product Term Expansion Capability

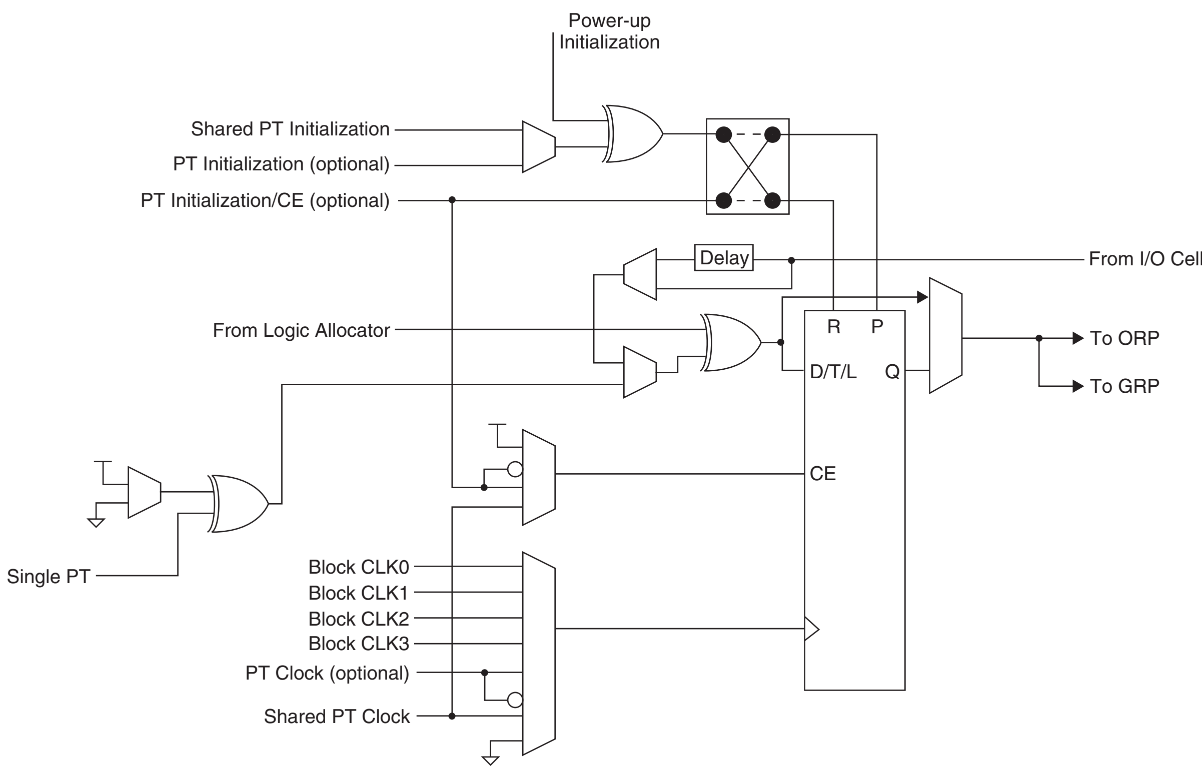
Expansion Chains	Macrocells Associated with Expansion Chain (with Wrap Around)	Max PT/ Macrocell
Chain-0	M0 Õ M4 Õ M8 Õ M12 Õ M0	75
Chain-1	M1 Õ M5 Õ M9 Õ M13 Õ M1	80
Chain-2	M2 Õ M6 Õ M10 Õ M14 Õ M2	75
Chain-3	M3 Õ M7 Õ M11 Õ M15 Õ M3	70

Every time the super cluster allocator is used, there is an incremental delay of t_{EXP}. When the super cluster allocator is used, all destinations other than the one being steered to, are given the value of ground (i.e., if the super cluster is steered to M (n+4), then M (n) is ground).

Macrocell

The 16 macrocells in the GLB are driven by the 16 outputs from the logic allocator. Each macrocell contains a programmable XOR gate, a programmable register/latch, along with routing for the logic and control functions. Figure 5 shows a graphical representation of the macrocell. The macrocells feed the ORP and GRP. A direct input from the I/O cell allows designers to use the macrocell to construct high-speed input registers. A programmable delay in this path allows designers to choose between the fastest possible set-up time and zero hold time.

Figure 5. Macrocell



Enhanced Clock Multiplexer

The clock input to the flip-flop can select any of the four block clocks along with the shared PT clock, and true and complement forms of the optional individual term clock. An 8:1 multiplexer structure is used to select the clock. The eight sources for the clock multiplexer are as follows:

- Block CLK0
- Block CLK1

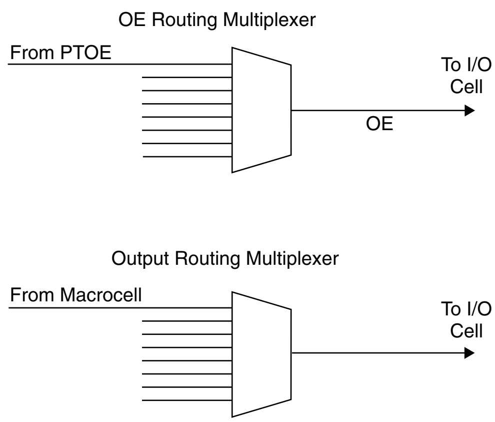
Output Routing Pool (ORP)

The Output Routing Pool allows macrocell outputs to be connected to any of several I/O cells within an I/O block. This provides greater flexibility in determining the pinout and allows design changes to occur without affecting the pinout. The output routing pool also provides a parallel capability for routing macrocell-level OE product terms. This allows the OE product term to follow the macrocell output as it is switched between I/O cells. The enhanced ORP of the ispMACH 4000ZE family consists of the following elements:

- Output Routing Multiplexers
- OE Routing Multiplexers

Figure 7 shows the structure of the ORP from the I/O cell perspective. This is referred to as an ORP slice. Each ORP has as many ORP slices as there are I/O cells in the corresponding I/O block.

Figure 7. ORP Slice



Output Routing Multiplexers

The details of connections between the macrocells and the I/O cells vary across devices and within a device dependent on the maximum number of I/Os available. Tables 5-7 provide the connection details.

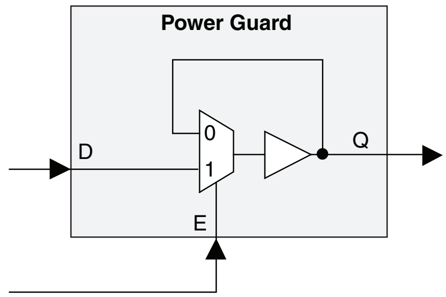
Output Enable Routing Multiplexers

The OE Routing Pool provides the corresponding local output enable (OE) product term to the I/O cell.

I/O Cell

The I/O cell contains the following programmable elements: output buffer, input buffer, OE multiplexer, Power Guard and bus maintenance circuitry. Figure 8 details the I/O cell.

Figure 9. Power Guard

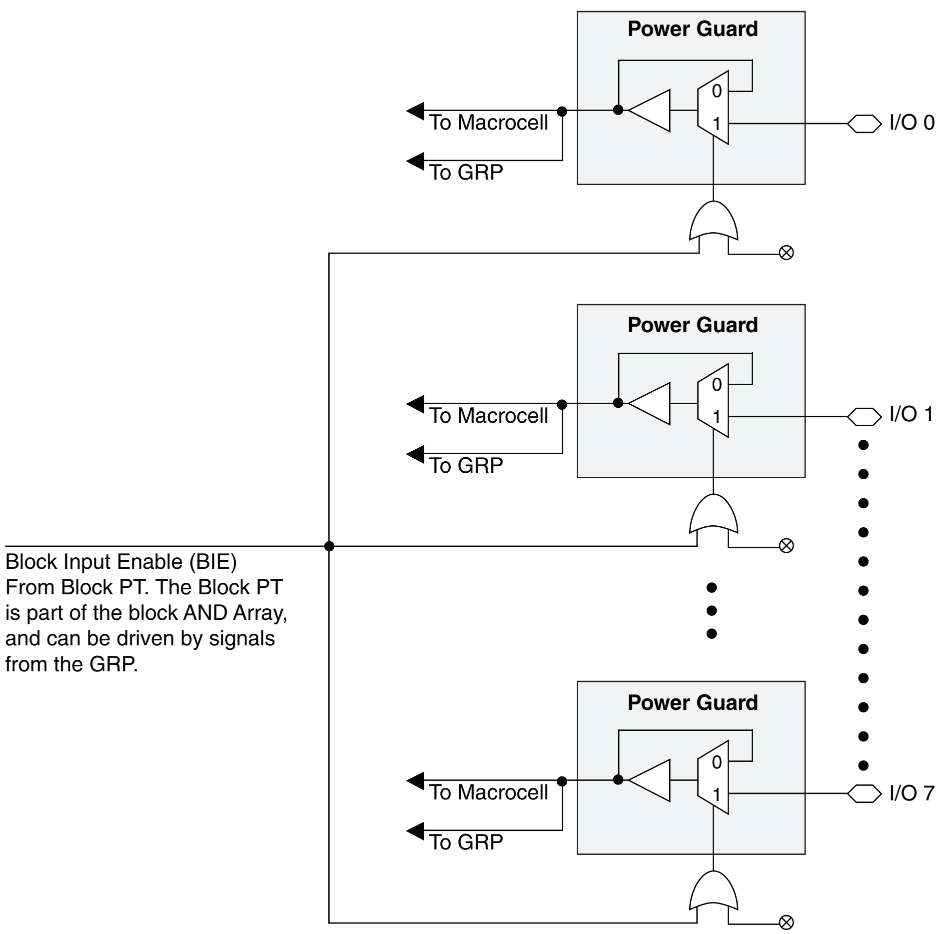


All the I/O pins in a block share a common Power Guard Enable signal. For a block of I/Os, this signal is called a Block Input Enable (BIE) signal. BIE can be internally generated using MC logic, or could come from external sources using one of the user I/O or input pins.

Any I/O pin in the block can be programmed to ignore the BIE signal. Thus, the feature can be enabled or disabled on a pin-by-pin basis.

Figure 10 shows Power Guard and BIE across multiple I/Os in a block that has eight I/Os.

Figure 10. Power Guard and BIE in a Block with 8 I/Os



The number of BIE inputs, thus the number of Power Guard “Blocks” that can exist in a device, depends on the device size. Table 8 shows the number of BIE signals available in the ispMACH 4000ZE family. The number of I/Os available in each block is shown in the Ordering Information section of this data sheet.

Table 8. Number of BIE Signals Available in ispMACH 4000ZE Devices

Device	Number of Logic Blocks, Power Guard Blocks and BIE Signals
ispMACH 4032ZE	Two (Blocks: A and B)
ispMACH 4064ZE	Four (Blocks: A, B, C and D)
ispMACH 4128ZE	Eight (Blocks: A, B, C, …, H)
ispMACH 4256ZE	Sixteen (Blocks: A, B, C, …, P)

Power Guard for Dedicated Inputs

Power Guard can optionally be applied to the dedicated inputs. The dedicated inputs and clocks are controlled by the BIE of the logic blocks shown in Tables 9 and 10.

Table 9. Dedicated Clock Inputs to BIE Association

CLK/I	32 MC Block	64MC Block	128MC Block	256MC Block
CLK0 / I	A	A	A	A
CLK1 / I	A	B	D	H
CLK2 / I	B	C	E	I
CLK3 / I	B	D	H	P

Table 10. Dedicated Inputs to BIE Association

Dedicated Input	4064ZE Block	4128ZE Block	4256ZE Block
0	A	B	D
1	B	C	E
2	B	D	G
3	C	F	G
4	D	G	J
5	D	H	L
6	—	—	M
7	—	—	O
8	—	—	O
9	—	—	B

For more information on the Power Guard function refer to TN1174, Advanced Features of the ispMACH 4000ZE Family.

Global OE (GOE) and Block Input Enable (BIE) Generation

Most ispMACH 4000ZE family devices have a 4-bit wide Global OE (GOE) Bus (Figure 11), except the ispMACH 4032 device that has a 2-bit wide Global OE Bus (Figure 12). This bus is derived from a 4-bit internal global OE (GOE) PT bus and two dual purpose I/O or GOE pins. Each signal that drives the bus can optionally be inverted.

Each GLB has a block-level OE PT that connects to all bits of the Global OE PT bus with four fuses. Hence, for a 256-macrocell device (with 16 blocks), each line of the bus is driven from 16 OE product terms. Figures 9 and 10 show a graphical representation of the global OE generation.

The block-level OE PT of each GLB is also tied to Block Input Enable (BIE) of that block. Hence, for a 256-macrocell device (with 16 blocks), each block's BIE signal is driven by block-level OE PT from each block.

Figure 11. Global OE Generation for All Devices Except ispMACH 4032ZE

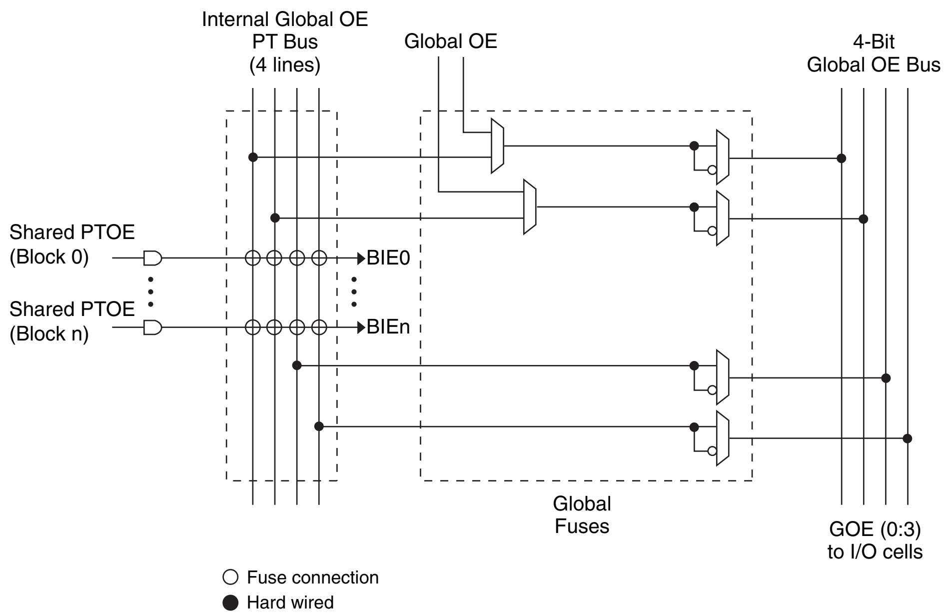


Figure 12. Global OE Generation for ispMACH 4032ZE

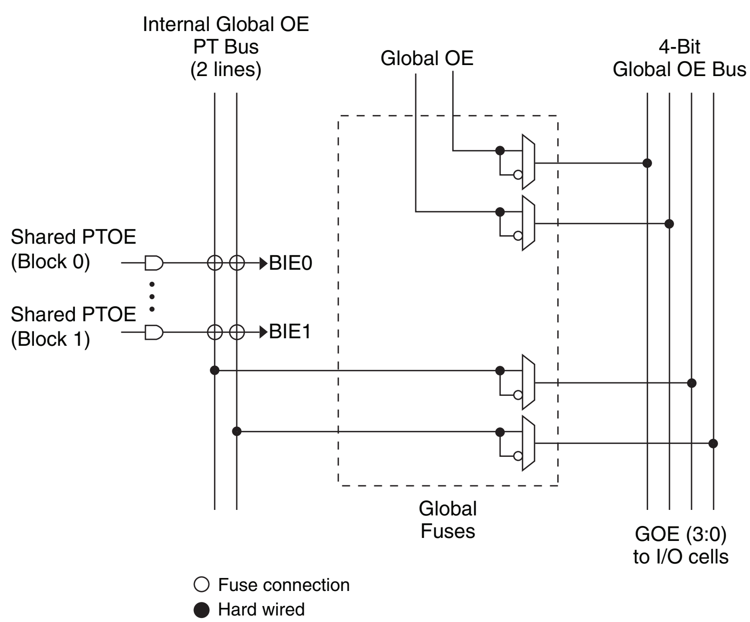

On-Chip Oscillator and Timer

An internal oscillator is provided for use in miscellaneous housekeeping functions such as watchdog heartbeats, digital de-glitch circuits and control state machines. The oscillator is disabled by default to save power. Figure 13 shows the block diagram of the oscillator and timer block.

mated test equipment. This equipment can then be used to program ispMACH 4000ZE devices during the testing of a circuit board.

User Electronic Signature

The User Electronic Signature (UES) allows the designer to include identification bits or serial numbers inside the device, stored in E^2CMOS memory. The ispMACH 4000ZE device contains 32 UES bits that can be configured by the user to store unique data such as ID codes, revision numbers or inventory control codes.

Security Bit

A programmable security bit is provided on the ispMACH 4000ZE devices as a deterrent to unauthorized copying of the array configuration patterns. Once programmed, this bit defeats readback of the programmed pattern by a device programmer, securing proprietary designs from competitors. Programming and verification are also defeated by the security bit. The bit can only be reset by erasing the entire device.

Hot Socketing

The ispMACH 4000ZE devices are well-suited for applications that require hot socketing capability. Hot socketing a device requires that the device, during power-up and down, can tolerate active signals on the I/Os and inputs without being damaged. Additionally, it requires that the effects of I/O pin loading be minimal on active signals. The ispMACH 4000ZE devices provide this capability for input voltages in the range 0V to 3.0V.

Density Migration

The ispMACH 4000ZE family has been designed to ensure that different density devices in the same package have the same pin-out. Furthermore, the architecture ensures a high success rate when performing design migration from lower density parts to higher density parts. In many cases, it is possible to shift a lower utilization design targeted for a high density device to a lower density device. However, the exact details of the final resource utilization will impact the likely success in each case.

Supply Current

To minimize transient current during power-on, configure CPLD I/Os to a pull-up or float state. If this logic scenario is not possible, then the recommended power sequence should assert VCC and VCCO at the same time or VCC before VCCO.

Symbol	Parameter	Condition	Min.	Typ.	Max.	Units
ispMACH 4032ZE						
ICC[1, 2, 3, 5, 6]	Operating Power Supply Current	Vcc = 1.8V, T_A = 25°C	—	50	—	µA

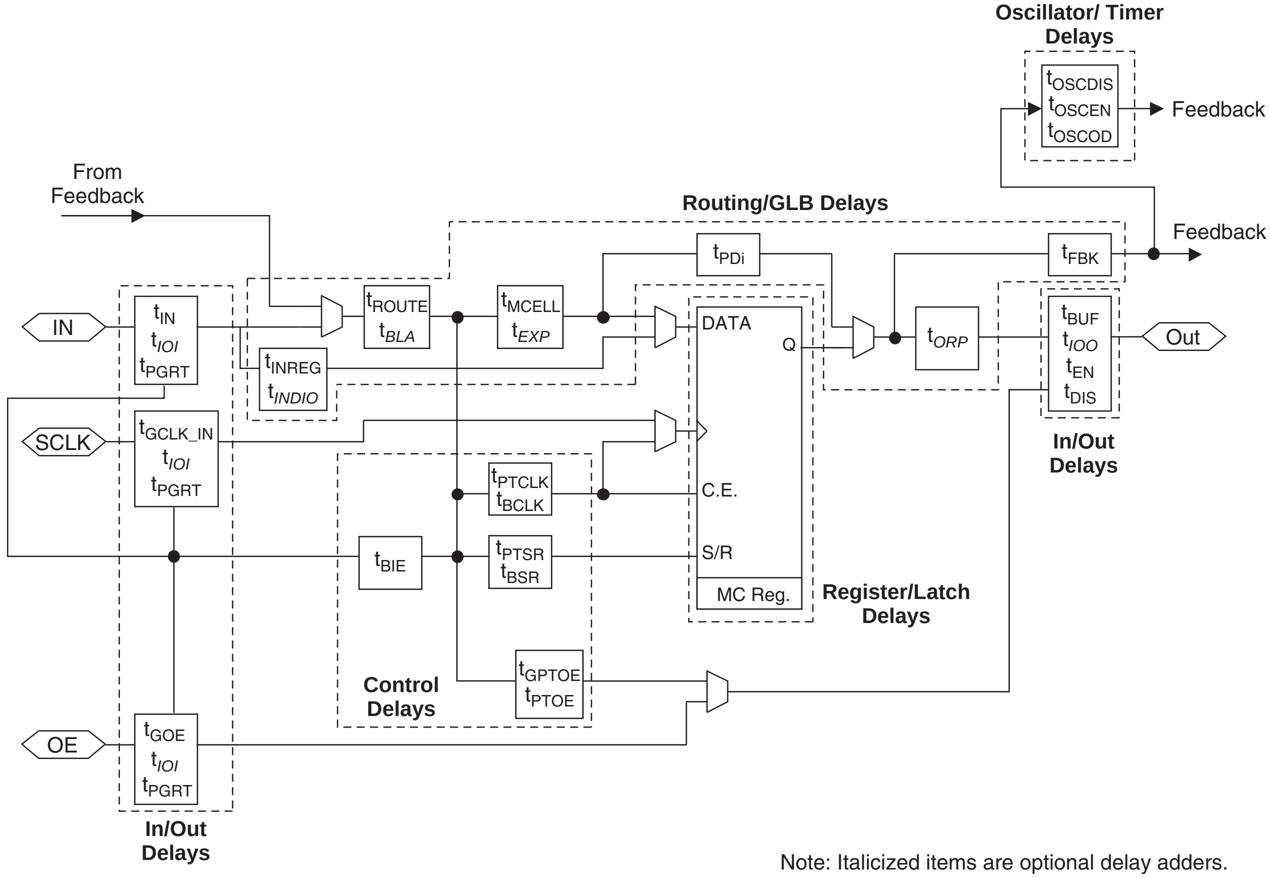
		Vcc = 1.9V, T_A = 0 to 70°C	—	32	65	µA
		Vcc = 1.9V, T_A = -40 to 85°C	—	43	100	µA

1. Frequency = 1.0 MHz.
2. Device configured with 16-bit counters.
3. I_{CC} varies with specific device configuration and operating frequency.
4. V_{CCO} = 3.6V, V_{IN} = 0V or $V_{CCO,}$ bus maintenance turned off. V_{IN} above V_{CCO} will add transient current above the specified standby I_{CC}.
5. Includes V_{CCO} current without output loading.
6. This operating supply current is with the internal oscillator disabled. Enabling the internal oscillator adds approximately 15µA typical current plus additional current from any logic it drives.

Timing Model

The task of determining the timing through the ispMACH 4000ZE family, like any CPLD, is relatively simple. The timing model provided in Figure 16 shows the specific delay paths. Once the implementation of a given function is determined either conceptually or from the software report file, the delay path of the function can easily be determined from the timing model. The Lattice design tools report the timing delays based on the same timing model for a particular design. Note that the internal timing parameters are given for reference only, and are not tested. The external timing parameters are tested and guaranteed for every device. For more information on the timing model and usage, refer to TN1168, ispMACH 4000ZE Timing Model Design and Usage Guidelines.

Figure 16. ispMACH 4000ZE Timing Model



Note: Italicized items are optional delay adders.

ispMACH 4000ZE Internal Timing Parameters (Cont.)

Over Recommended Operating Conditions

Parameter	Description		LC4032ZE -4 Min.	LC4032ZE -4 Max.	LC4064ZE -4 Min.	LC4064ZE -4 Max.	Units
LVCMOS15_out	Output Configured as 1.5V Buffer	t_{EN}, t_{DIS}, t_{BUF}	—	0.20	—	0.20	ns
LVCMOS18_out	Output Configured as 1.8V Buffer	t_{EN}, t_{DIS}, t_{BUF}	—	0.00	—	0.00	ns
LVCMOS25_out	Output Configured as 2.5V Buffer	t_{EN}, t_{DIS}, t_{BUF}	—	0.10	—	0.10	ns

Revision History

Date	Version	Change Summary
April 2008	01.0	Initial release.
July 2008	01.1	Updated Features bullets.
		Updated typical Hysteresis voltage.
		Updated Power Guard for Dedicated Inputs section.
		Updated DC Electrical Characteristics table.
		Updated Supply Current table.
		Updated I/O DC Electrical Characteristics table and note 2.
		Updated ispMACH 4000ZE Timing Model.
		Added new parameters for the Internal Oscillator.
		Updated ORP Reference table.
		Updated Power Supply and NC Connections table.
		Updated 100 TQFP Logic Signal Connections table with LC4128ZE and 4256ZE.
		Updated 144 csBGA Logic Signal Connections table with LC4128ZE and 4256ZE.
		Added 144 TQFP Logic Signal Connections table.
August 2008	01.2	Data sheet status changed from advance to final.
		Updated Supply Current table.
		Updated External Switching Characteristics.
		Updated Internal Timing Parameters.
		Updated Power Consumption graph and Power Estimation Coefficients table.
		Updated Ordering Information mark format example.
December 2008	01.3	Updated ispMACH 4000ZE Family Selection Guide table to include 64-ball ucBGA and 132-ball ucBGA packages.
		Updated ispMACH 4000ZE Power Supply and NC Connections table to include 64-ball ucBGA and 132-ball ucBGA packages.
		Added Logic Signal Connections tables for 64-ball ucBGA and 132-ball ucBGA packages.
		Updated Part Number Description diagram for 64-ball ucBGA and 132-ball ucBGA packages.
		Updated Ordering Information tables for 64-ball ucBGA and 132-ball ucBGA packages.
May 2009	01.4	Correction to t_{CW}, t_{GW}, t_{WIR} and f_{MAX} parameters in External Switching Characteristics table.
June 2011	01.5	Added copper bond package part numbers.
		Added footnote 4 to Absolute Maximum Ratings.
February 2012	01.6	Updated document with new corporate logo.
February 2012	01.7	Removed copper bond packaging information. Refer to PCN 04A-12 for further information.
		Updated topside marks with new logos in the Ordering Information section.
