Understanding Embedded - CPLDs (Complex Programmable Logic Devices)

Embedded - CPLDs, or Complex Programmable Logic Devices, are highly versatile digital logic devices used in electronic systems. These programmable components are designed to perform complex logical operations and can be customized for specific applications. Unlike fixed-function ICs, CPLDs offer the flexibility to reprogram their configuration, making them an ideal choice for various embedded systems. They consist of a set of logic gates and programmable interconnects, allowing designers to implement complex logic circuits without needing custom hardware.

Applications of Embedded - CPLDs

Details	
Product Status	Obsolete
Programmable Type	In System Programmable
Delay Time tpd(1) Max	5.8 ns
Voltage Supply - Internal	1.7V ~ 1.9V
Number of Logic Elements/Blocks	4
Number of Macrocells	64
Number of Gates	-
Number of I/O	64
Operating Temperature	0°C ~ 90°C (TJ)
Mounting Type	Surface Mount
Package / Case	100-LQFP
Supplier Device Package	100-TQFP (14x14)
Purchase URL	https://www.e-xfl.com/product-detail/lattice-semiconductor/lc4064ze-5tcn100c

Introduction

The high performance ispMACH 4000ZE family from Lattice offers an ultra low power CPLD solution. The new family is based on Lattice's industry-leading ispMACH 4000 architecture. Retaining the best of the previous generation, the ispMACH 4000ZE architecture focuses on significant innovations to combine high performance with low power in a flexible CPLD family. For example, the family's new Power Guard feature minimizes dynamic power consumption by preventing internal logic toggling due to unnecessary I/O pin activity.

The ispMACH 4000ZE combines high speed and low power with the flexibility needed for ease of design. With its robust Global Routing Pool and Output Routing Pool, this family delivers excellent First-Time-Fit, timing predictability, routing, pin-out retention and density migration.

The ispMACH 4000ZE family offers densities ranging from 32 to 256 macrocells. There are multiple density-I/O combinations in Thin Quad Flat Pack (TQFP), Chip Scale BGA (csBGA), and Ultra Chip Scale BGA (ucBGA) packages ranging from 32 to 144 pins/balls. Table 1 shows the macrocell, package and I/O options, along with other key parameters.

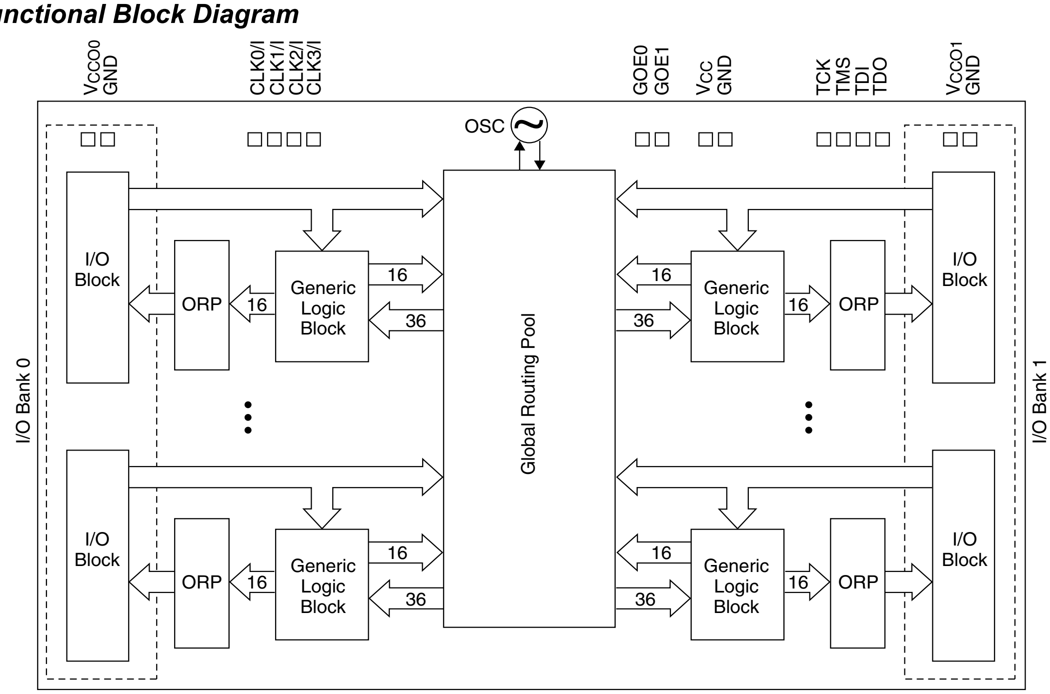
A user programmable internal oscillator and a timer are included in the device for tasks like LED control, keyboard scanner and similar housekeeping type state machines. This feature can be optionally disabled to save power.

The ispMACH 4000ZE family has enhanced system integration capabilities. It supports a 1.8V supply voltage and 3.3V, 2.5V, 1.8V and 1.5V interface voltages. Additionally, inputs can be safely driven up to 5.5V when an I/O bank is configured for 3.3V operation, making this family 5V tolerant. The ispMACH 4000ZE also offers enhanced I/O features such as slew rate control, PCI compatibility, bus-keeper latches, pull-up resistors, pull-down resistors, open drain outputs and hot socketing. Pull-up, pull-down and bus-keeper features are controllable on a "per-pin" basis. The ispMACH 4000ZE family members are 1.8V in-system programmable through the IEEE Standard 1532 interface. IEEE Standard 1149.1 boundary scan testing capability also allows product testing on automated test equipment. The 1532 interface signals TCK, TMS, TDI and TDO are referenced to V_{CC} (logic core).

Overview

The ispMACH 4000ZE devices consist of multiple 36-input, 16-macrocell Generic Logic Blocks (GLBs) interconnected by a Global Routing Pool (GRP). Output Routing Pools (ORPs) connect the GLBs to the I/O Blocks (IOBs), which contain multiple I/O cells. This architecture is shown in Figure 1.

Figure 1. Functional Block Diagram



The I/Os in the ispMACH 4000ZE are split into two banks. Each bank has a separate I/O power supply. Inputs can support a variety of standards independent of the chip or bank power supply. Outputs support the standards compatible with the power supply provided to the bank. Support for a variety of standards helps designers implement designs in mixed voltage environments. In addition, 5V tolerant inputs are specified within an I/O bank that is connected to a V_{CCO} of 3.0V to 3.6V for LVCMOS 3.3, LVTTL and PCI interfaces.

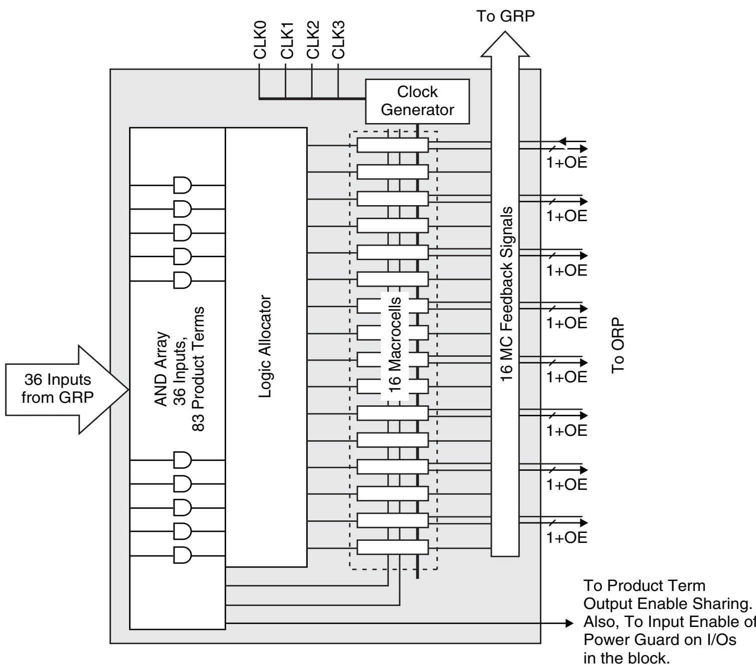
Architecture

There are a total of two GLBs in the ispMACH 4032ZE, increasing to 16 GLBs in the ispMACH 4256ZE. Each GLB has 36 inputs. All GLB inputs come from the GRP and all outputs from the GLB are brought back into the GRP to be connected to the inputs of any other GLB on the device. Even if feedback signals return to the same GLB, they still must go through the GRP. This mechanism ensures that GLBs communicate with each other with consistent and predictable delays. The outputs from the GLB are also sent to the ORP. The ORP then sends them to the associated I/O cells in the I/O block.

Generic Logic Block

The ispMACH 4000ZE GLB consists of a programmable AND array, logic allocator, 16 macrocells and a GLB clock generator. Macrocells are decoupled from the product terms through the logic allocator and the I/O pins are decoupled from macrocells through the ORP. Figure 2 illustrates the GLB.

Figure 2. Generic Logic Block



AND Array

The programmable AND Array consists of 36 inputs and 83 output product terms. The 36 inputs from the GRP are used to form 72 lines in the AND Array (true and complement of the inputs). Each line in the array can be connected to any of the 83 output product terms via a wired-AND. Each of the 80 logic product terms feed the logic allocator with the remaining three control product terms feeding the Shared PT Clock, Shared PT Initialization and Shared PT OE. The Shared PT Clock and Shared PT Initialization signals can optionally be inverted before being fed to the macrocells.

Every set of five product terms from the 80 logic product terms forms a product term cluster starting with PT0. There is one product term cluster for every macrocell in the GLB. Figure 3 is a graphical representation of the AND Array.

Product Term Allocator

The product term allocator assigns product terms from a cluster to either logic or control applications as required by the design being implemented. Product terms that are used as logic are steered into a 5-input OR gate associated with the cluster. Product terms that used for control are steered either to the macrocell or I/O cell associated with the cluster. Table 2 shows the available functions for each of the five product terms in the cluster.

Table 2. Individual PT Steering

Product Term	Logic	Control
PT*n*	Logic PT	Single PT for XOR/OR
PT*n*+1	Logic PT	Individual Clock (PT Clock)
PT*n*+2	Logic PT	Individual Initialization or Individual Clock Enable (PT Initialization/CE)
PT*n*+3	Logic PT	Individual Initialization (PT Initialization)
PT*n*+4	Logic PT	Individual OE (PTOE)

Cluster Allocator

The cluster allocator allows clusters to be steered to neighboring macrocells, thus allowing the creation of functions with more product terms. Table 3 shows which clusters can be steered to which macrocells. Used in this manner, the cluster allocator can be used to form functions of up to 20 product terms. Additionally, the cluster allocator accepts inputs from the wide steering logic. Using these inputs, functions up to 80 product terms can be created.

Table 3. Available Clusters for Each Macrocell

Macrocell	Available Clusters			
M0	—	C0	C1	C2
M1	C0	C1	C2	C3
M2	C1	C2	C3	C4
M3	C2	C3	C4	C5
M4	C3	C4	C5	C6
M5	C4	C5	C6	C7
M6	C5	C6	C7	C8
M7	C6	C7	C8	C9
M8	C7	C8	C9	C10
M9	C8	C9	C10	C11
M10	C9	C10	C11	C12
M11	C10	C11	C12	C13
M12	C11	C12	C13	C14
M13	C12	C13	C14	C15
M14	C13	C14	C15	—
M15	C14	C15	—	—

Wide Steering Logic

The wide steering logic allows the output of the cluster allocator n to be connected to the input of the cluster allocator *n*+4. Thus, cluster chains can be formed with up to 80 product terms, supporting wide product term functions and allowing performance to be increased through a single GLB implementation. Table 4 shows the product term chains.

- Block CLK2
- Block CLK3
- PT Clock
- PT Clock Inverted
- Shared PT Clock
- Ground

Clock Enable Multiplexer

Each macrocell has a 4:1 clock enable multiplexer. This allows the clock enable signal to be selected from the following four sources:

- PT Initialization/CE
- PT Initialization/CE Inverted
- Shared PT Clock
- Logic High

Initialization Control

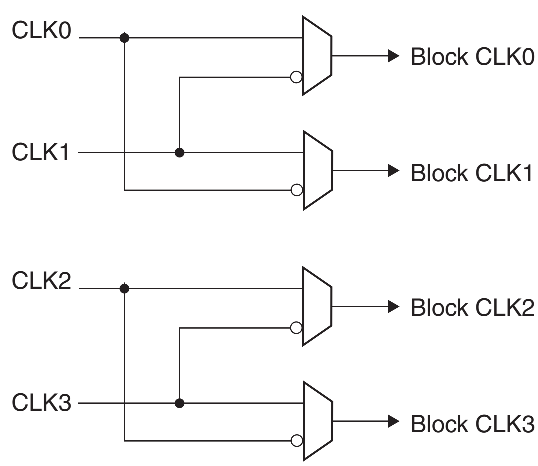
The ispMACH 4000ZE family architecture accommodates both block-level and macrocell-level set and reset capability. There is one block-level initialization term that is distributed to all macrocell registers in a GLB. At the macrocell level, two product terms can be “stolen” from the cluster associated with a macrocell to be used for set/reset functionality. A reset/preset swapping feature in each macrocell allows for reset and preset to be exchanged, providing flexibility.

Note that the reset/preset swapping selection feature affects power-up reset as well. All flip-flops power up to a known state for predictable system initialization. If a macrocell is configured to SET on a signal from the block-level initialization, then that macrocell will be SET during device power-up. If a macrocell is configured to RESET on a signal from the block-level initialization or is not configured for set/reset, then that macrocell will RESET on power-up. To guarantee initialization values, the V_{CC} rise must be monotonic, and the clock must be inactive until the reset delay time has elapsed.

GLB Clock Generator

Each ispMACH 4000ZE device has up to four clock pins that are also routed to the GRP to be used as inputs. These pins drive a clock generator in each GLB, as shown in Figure 6. The clock generator provides four clock signals that can be used anywhere in the GLB. These four GLB clock signals can consist of a number of combinations of the true and complement edges of the global clock signals.

Figure 6. GLB Clock Generator



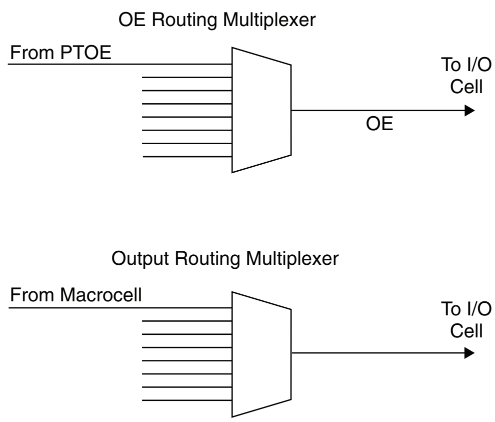
Output Routing Pool (ORP)

The Output Routing Pool allows macrocell outputs to be connected to any of several I/O cells within an I/O block. This provides greater flexibility in determining the pinout and allows design changes to occur without affecting the pinout. The output routing pool also provides a parallel capability for routing macrocell-level OE product terms. This allows the OE product term to follow the macrocell output as it is switched between I/O cells. The enhanced ORP of the ispMACH 4000ZE family consists of the following elements:

- Output Routing Multiplexers
- OE Routing Multiplexers

Figure 7 shows the structure of the ORP from the I/O cell perspective. This is referred to as an ORP slice. Each ORP has as many ORP slices as there are I/O cells in the corresponding I/O block.

Figure 7. ORP Slice



Output Routing Multiplexers

The details of connections between the macrocells and the I/O cells vary across devices and within a device dependent on the maximum number of I/Os available. Tables 5-7 provide the connection details.

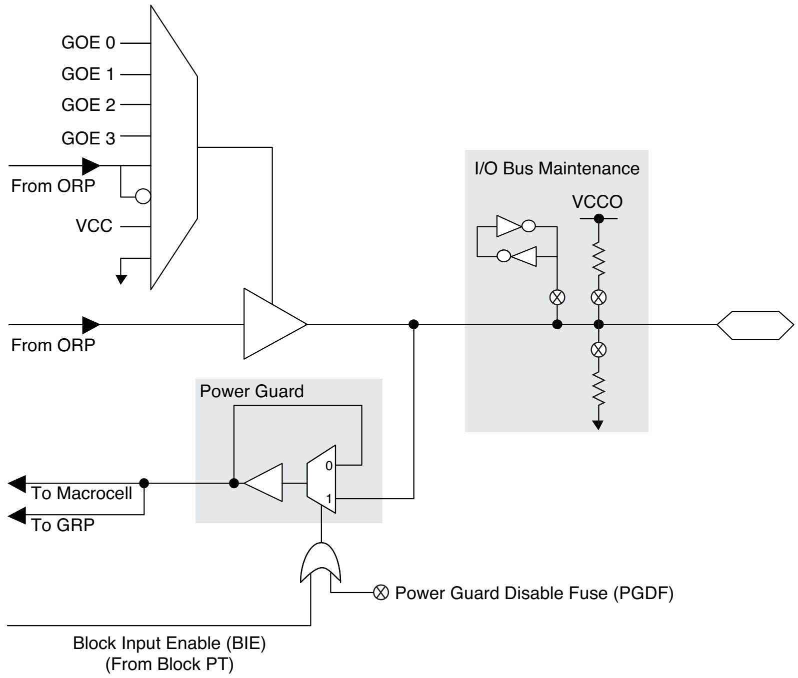
Output Enable Routing Multiplexers

The OE Routing Pool provides the corresponding local output enable (OE) product term to the I/O cell.

I/O Cell

The I/O cell contains the following programmable elements: output buffer, input buffer, OE multiplexer, Power Guard and bus maintenance circuitry. Figure 8 details the I/O cell.

Figure 8. I/O Cell



Each output supports a variety of output standards dependent on the V_{CCO} supplied to its I/O bank. Outputs can also be configured for open drain operation. Each input can be programmed to support a variety of standards, independent of the V_{CCO} supplied to its I/O bank. The I/O standards supported are:

- LVTTL
- LVCMOS 3.3
- LVCMOS 2.5
- LVCMOS 1.8
- LVCMOS 1.5
- 3.3V PCI Compatible

All of the I/Os and dedicated inputs have the capability to provide a bus-keeper latch, pull-up resistor or pull-down resistor selectable on a "per-pin" basis. A fourth option is to provide none of these. The default in both hardware and software is such that when the device is erased or if the user does not specify, the input structure is configured to be a Pull-down Resistor.

Each ispMACH 4000ZE device I/O has an individually programmable output slew rate control bit. Each output can be individually configured for fast slew or slow slew. The typical edge rate difference between fast and slow slew setting is 20%. For high-speed designs with long, unterminated traces, the slow-slew rate will introduce fewer reflections, less noise and keep ground bounce to a minimum. For designs with short traces or well terminated lines, the fast slew rate can be used to achieve the highest speed.

The ispMACH 4000ZE family has an always on, 200mV typical hysteresis for each input operational at 3.3V and 2.5V. This provides improved noise immunity for slow transitioning signals.

Power Guard

Power Guard allows easier achievement of standby current in the system. As shown in Figure 9, this feature consists of an enabling multiplexer between an I/O pin and input buffer, and its associated circuitry inside the device.

If the enable signal (E) is held low, all inputs (D) can be optionally isolated (guarded), such that, if any of these were toggled, it would not cause any toggle on internal pins (Q), thus, a toggling I/O pin will not cause any internal dynamic power consumption.

Some Simple Use Scenarios

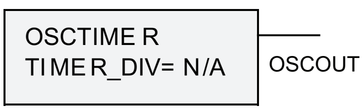
The following diagrams show a few simple examples that omit optional signals for the OSCTIMER block:

A. An oscillator giving 5MHz nominal clock

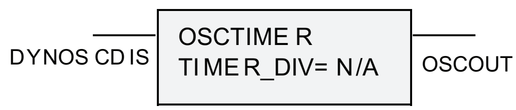
B. An oscillator that can be disabled with an external signal (5MHz nominal clock)

C. An oscillator giving approximately 5 Hz nominal clock (TIMER_DIV = 2^{20} (1,048,576))

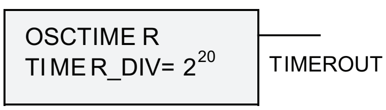
D. An oscillator giving two output clocks: ~5MHz and ~5KHz (TIMER_DIV= 2^{10} (1,024))



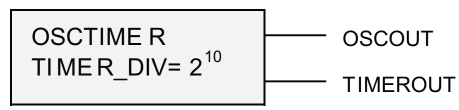
(A) A simple 5MHz oscillator.



(B) An oscillator with dynamic disable.



(C) A simple 5Hz oscillator.



(D) Oscillator with two outputs (5MHz and 5KHz).

OSCTIMER Integration With CPLD Fabric

The OSCTIMER is integrated into the CPLD fabric using the Global Routing Pool (GRP). The macrocell (MC) feedback path for two macrocells is augmented with a programmable multiplexer, as shown in Figure 15. The OSCTIMER outputs (OSCOUT and TIMEROUT) can optionally drive the GRP lines, whereas the macrocell outputs can drive the optional OSCTIMER inputs TIMERRES and DYNOSCDIS.

Figure 15. OSCTIMER Integration With CPLD Fabric

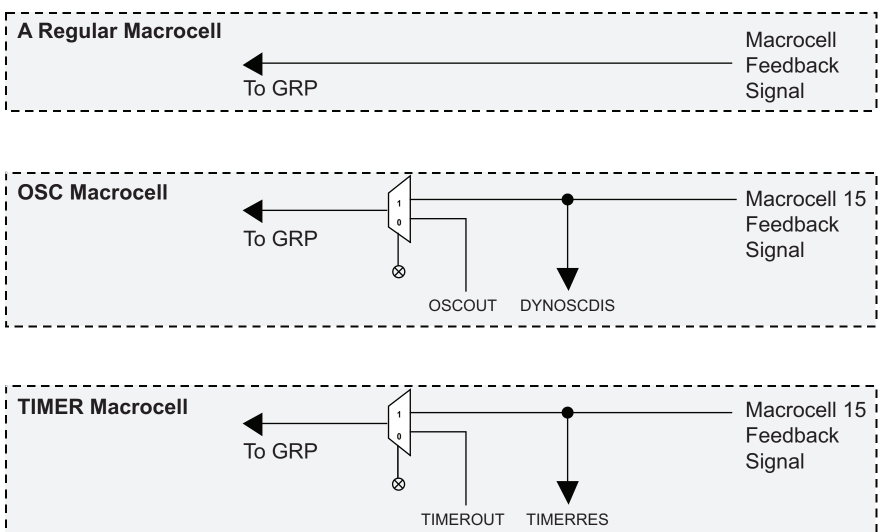


Table 12 shows how these two MCs are designated in each of the ispMACH4000ZE device.

1. The average DC current drawn by I/Os between adjacent bank GND connections, or between the last GND in an I/O bank and the end of the I/O bank, as shown in the logic signals connection table, shall not exceed *n**8mA. Where *n* is the number of I/Os between bank GND connections or between the last GND in a bank and the end of a bank.
2. For 1.5V inputs, there may be an additional DC current drawn from V_{CC}, if the ispMACH 4000ZE V_{CC} and the V_{CC} of the driving device (V_{CC}d-d; that determines steady state V_{IH}) are in the extreme range of their specifications. Typically, DC current drawn from V_{CC} will be 2µA per input.

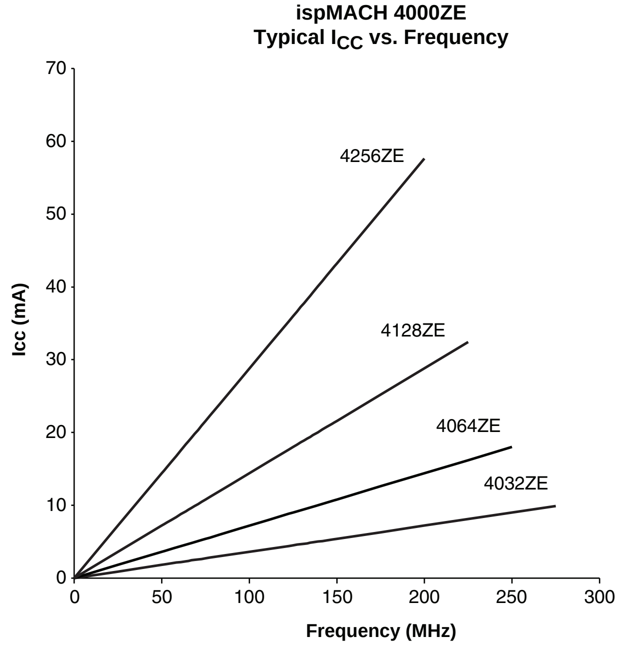
t_{OSCNOM}	Oscillator OSCOUT Nominal Frequency			5.00		5.00	MHz
t_{OSCvar}	Oscillator Variation of Nominal Frequency		—	30	—	30	%
$t_{TMRCO20}$	Oscillator TIMEROUT Clock (Negative Edge) to Out (20-Bit Divider)		—	12.50	—	14.50	ns
$t_{TMRCO10}$	Oscillator TIMEROUT Clock (Negative Edge) to Out (10-Bit Divider)		—	7.50	—	9.50	ns
t_{TMRCO7}	Oscillator TIMEROUT Clock (Negative Edge) to Out (7-Bit Divider)		—	6.00	—	8.00	ns
$t_{TMRRSTO}$	Oscillator TIMEROUT Reset to Out (Going Low)		—	5.00	—	7.00	ns
t_{TMRRR}	Oscillator TIMEROUT Asynchronous Reset Recovery Delay		—	4.00	—	6.00	ns
$t_{TMRRSTPW}$	Oscillator TIMEROUT Reset Minimum Pulse Width		3.00	—	5.00	—	ns
Optional Delay Adjusters		**Base Parameter**					
t_{INDIO}	Input Register Delay	t_{INREG}	—	1.60	—	2.60	ns
t_{EXP}	Product Term Expander Delay	t_{MCELL}	—	0.45	—	0.50	ns
t_{BLA}	Additional Block Loading Adders	t_{ROUTE}	—	0.05	—	0.05	ns
t_{IOI} Input Buffer Delays							
LVTTL_in	Using LVTTL Standard with Hysteresis	t_{IN}, t_{GCLK_IN}, t_{GOE}	—	0.60	—	0.60	ns
LVCMOS15_in	Using LVCMOS 1.5 Standard	t_{IN}, t_{GCLK_IN}, t_{GOE}	—	0.20	—	0.20	ns
LVCMOS18_in	Using LVCMOS 1.8 Standard	t_{IN}, t_{GCLK_IN}, t_{GOE}	—	0.00	—	0.00	ns
LVCMOS25_in	Using LVCMOS 2.5 Standard with Hysteresis	t_{IN}, t_{GCLK_IN}, t_{GOE}	—	0.80	—	0.80	ns
LVCMOS33_in	Using LVCMOS 3.3 Standard with Hysteresis	t_{IN}, t_{GCLK_IN}, t_{GOE}	—	0.80	—	0.80	ns
PCI_in	Using PCI Compatible Input with Hysteresis	t_{IN}, t_{GCLK_IN}, t_{GOE}	—	0.80	—	0.80	ns
t_{IOO} Output Buffer Delays							
LVTTL_out	Output Configured as TTL Buffer	t_{EN}, t_{DIS}, t_{BUF}	—	0.20	—	0.20	ns

Power Consumption



Power Estimation Coefficients[1]

Device	A	B
ispMACH 4032ZE	0.010	0.009
ispMACH 4064ZE	0.011	0.009
ispMACH 4128ZE	0.012	0.009
ispMACH 4256ZE	0.013	0.009

1. For further information about the use of these coefficients, refer to TN1187, Power Estimation in ispMACH 4000ZE Devices.

Switching Test Conditions

Figure 17 shows the output test load that is used for AC testing. The specific values for resistance, capacitance, voltage, and other test conditions are shown in Table 13.

Figure 17. Output Test Load, LVTTL and LVCMOS Standards

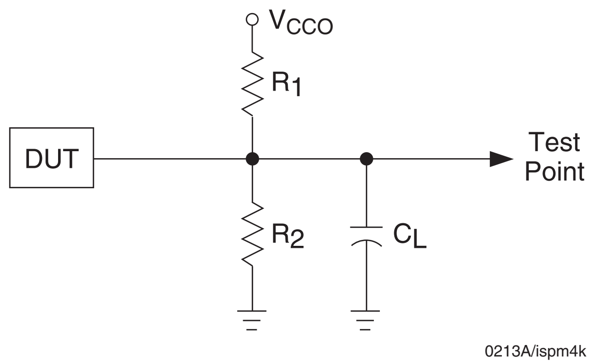


Table 13. Test Fixture Required Components

Test Condition	R_1	R_2	C_L[1]	Timing Ref.	V_{CCO}
LVCMOS I/O, (L -> H, H -> L)	106Ω	106Ω	35pF	LVCMOS 3.3 = 1.5V	LVCMOS 3.3 = 3.0V
				LVCMOS 2.5 = $\frac{V_{CCO}}{2}$	LVCMOS 2.5 = 2.3V
				LVCMOS 1.8 = $\frac{V_{CCO}}{2}$	LVCMOS 1.8 = 1.65V
				LVCMOS 1.5 = $\frac{V_{CCO}}{2}$	LVCMOS 1.5 = 1.4V
LVCMOS I/O (Z -> H)	∞	106Ω	35pF	1.5V	3.0V
LVCMOS I/O (Z -> L)	106Ω	∞	35pF	1.5V	3.0V
LVCMOS I/O (H -> Z)	∞	106Ω	5pF	V_{OH} - 0.3	3.0V
LVCMOS I/O (L -> Z)	106Ω	∞	5pF	V_{OL} + 0.3	3.0V

1. C_L includes test fixtures and probe capacitance.
