Welcome to E-XFL.COM

Understanding <u>Embedded - CPLDs (Complex</u> <u>Programmable Logic Devices)</u>

Embedded - CPLDs, or Complex Programmable Logic Devices, are highly versatile digital logic devices used in electronic systems. These programmable components are designed to perform complex logical operations and can be customized for specific applications. Unlike fixedfunction ICs, CPLDs offer the flexibility to reprogram their configuration, making them an ideal choice for various embedded systems. They consist of a set of logic gates and programmable interconnects, allowing designers to implement complex logic circuits without needing custom hardware.

Applications of Embedded - CPLDs

Details

Product Status	Obsolete
Programmable Type	In System Programmable
Delay Time tpd(1) Max	5.8 ns
Voltage Supply - Internal	1.7V ~ 1.9V
Number of Logic Elements/Blocks	4
Number of Macrocells	64
Number of Gates	-
Number of I/O	64
Operating Temperature	-40°C ~ 105°C (TJ)
Mounting Type	Surface Mount
Package / Case	100-LQFP
Supplier Device Package	100-TQFP (14x14)
Purchase URL	https://www.e-xfl.com/product-detail/lattice-semiconductor/lc4064ze-5tcn100i

Email: info@E-XFL.COM

Address: Room A, 16/F, Full Win Commercial Centre, 573 Nathan Road, Mongkok, Hong Kong

- Shared PT Clock
- Ground

Clock Enable Multiplexer

Each macrocell has a 4:1 clock enable multiplexer. This allows the clock enable signal to be selected from the following four sources:

- PT Initialization/CE
- PT Initialization/CE Inverted
- Shared PT Clock
- Logic High

Initialization Control

The ispMACH 4000ZE family architecture accommodates both block-level and macrocell-level set and reset capability. There is one block-level initialization term that is distributed to all macrocell registers in a GLB. At the macrocell level, two product terms can be "stolen" from the cluster associated with a macrocell to be used for set/reset functionality. A reset/preset swapping feature in each macrocell allows for reset and preset to be exchanged, providing flexibility.

Note that the reset/preset swapping selection feature affects power-up reset as well. All flip-flops power up to a known state for predictable system initialization. If a macrocell is configured to SET on a signal from the block-level initialization, then that macrocell will be SET during device power-up. If a macrocell is configured to RESET on a signal from the block-level initialization or is not configured for set/reset, then that macrocell will RESET on power-up. To guarantee initialization values, the V_{CC} rise must be monotonic, and the clock must be inactive until the reset delay time has elapsed.

GLB Clock Generator

Each ispMACH 4000ZE device has up to four clock pins that are also routed to the GRP to be used as inputs. These pins drive a clock generator in each GLB, as shown in Figure 6. The clock generator provides four clock signals that can be used anywhere in the GLB. These four GLB clock signals can consist of a number of combinations of the true and complement edges of the global clock signals.

Figure 6. GLB Clock Generator

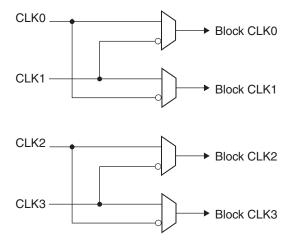

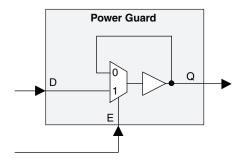

Figure 9. Power Guard

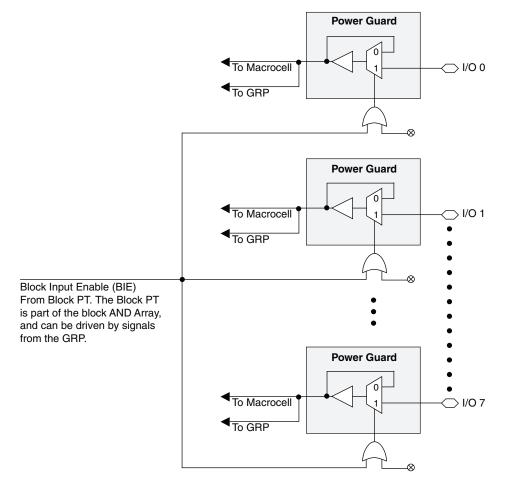

All the I/O pins in a block share a common Power Guard Enable signal. For a block of I/Os, this signal is called a Block Input Enable (BIE) signal. BIE can be internally generated using MC logic, or could come from external sources using one of the user I/O or input pins.

Any I/O pin in the block can be programmed to ignore the BIE signal. Thus, the feature can be enabled or disabled on a pin-by-pin basis.

Figure 10 shows Power Guard and BIE across multiple I/Os in a block that has eight I/Os.

Figure 10. Power Guard and BIE in a Block with 8 I/Os

The number of BIE inputs, thus the number of Power Guard "Blocks" that can exist in a device, depends on the device size. Table 8 shows the number of BIE signals available in the ispMACH 4000ZE family. The number of I/Os available in each block is shown in the Ordering Information section of this data sheet.

Device	Number of Logic Blocks, Power Guard Blocks and BIE Signals			
ispMACH 4032ZE	Two (Blocks: A and B)			
ispMACH 4064ZE	Four (Blocks: A, B, C and D)			
ispMACH 4128ZE	Eight (Blocks: A, B, C,, H)			
ispMACH 4256ZE	Sixteen (Blocks: A, B, C,, P)			

Table 8. Number of BIE Signals Available in ispMACH 4000ZE Devices

Power Guard for Dedicated Inputs

Power Guard can optionally be applied to the dedicated inputs. The dedicated inputs and clocks are controlled by the BIE of the logic blocks shown in Tables 9 and 10.

Table 9. Dedicated Clock Inputs to BIE Association

CLK/I	32 MC Block	64MC Block	128MC Block	256MC Block
CLK0 / I	A	A	A	A
CLK1 / I	A	В	D	Н
CLK2 / I	В	С	E	I
CLK3 / I	В	D	Н	Р

Table 10. Dedicated Inputs to BIE Association

Dedicated Input	4064ZE Block	4128ZE Block	4256ZE Block
0	A	В	D
1	В	С	E
2	В	D	G
3	С	F	G
4	D	G	J
5	D	Н	L
6	—	—	М
7	_	—	0
8	_	—	0
9		—	В

For more information on the Power Guard function refer to TN1174, <u>Advanced Features of the ispMACH 4000ZE</u> <u>Family</u>.

Global OE (GOE) and Block Input Enable (BIE) Generation

Most ispMACH 4000ZE family devices have a 4-bit wide Global OE (GOE) Bus (Figure 11), except the ispMACH 4032 device that has a 2-bit wide Global OE Bus (Figure 12). This bus is derived from a 4-bit internal global OE (GOE) PT bus and two dual purpose I/O or GOE pins. Each signal that drives the bus can optionally be inverted.

Each GLB has a block-level OE PT that connects to all bits of the Global OE PT bus with four fuses. Hence, for a 256-macrocell device (with 16 blocks), each line of the bus is driven from 16 OE product terms. Figures 9 and 10 show a graphical representation of the global OE generation.

The block-level OE PT of each GLB is also tied to Block Input Enable (BIE) of that block. Hence, for a 256-macrocell device (with 16 blocks), each block's BIE signal is driven by block-level OE PT from each block.

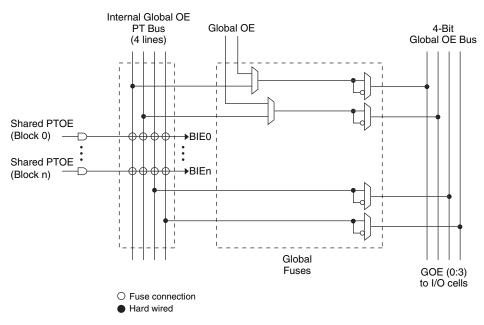

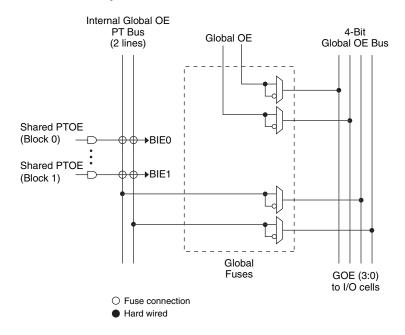

Figure 12. Global OE Generation for ispMACH 4032ZE

On-Chip Oscillator and Timer

An internal oscillator is provided for use in miscellaneous housekeeping functions such as watchdog heartbeats, digital de-glitch circuits and control state machines. The oscillator is disabled by default to save power. Figure 13 shows the block diagram of the oscillator and timer block.

Table 12. OSC and TIMER MC Designation

Device	Macrocell	Block Number	MC Number
ispMACH 4032ZE	OSC MC	A	15
	TIMER MC	B	15
ispMACH 4064ZE	OSC MC	A	15
	TIMER MC	D	15
ispMACH 4128ZE	OSC MC	A	15
	TIMER MC	G	15
ispMACH 4256ZE	OSC MC	C	15
	TIMER MC	F	15

Zero Power/Low Power and Power Management

The ispMACH 4000ZE family is designed with high speed low power design techniques to offer both high speed and low power. With an advanced E² low power cell and non sense-amplifier design approach (full CMOS logic approach), the ispMACH 4000ZE family offers fast pin-to-pin speeds, while simultaneously delivering low standby power without needing any "turbo bits" or other power management schemes associated with a traditional sense-amplifier approach.

The zero power ispMACH 4000ZE is based on the 1.8V ispMACH 4000Z family. With innovative circuit design changes, the ispMACH 4000ZE family is able to achieve the industry's lowest static power.

IEEE 1149.1-Compliant Boundary Scan Testability

All ispMACH 4000ZE devices have boundary scan cells and are compliant to the IEEE 1149.1 standard. This allows functional testing of the circuit board on which the device is mounted through a serial scan path that can access all critical logic notes. Internal registers are linked internally, allowing test data to be shifted in and loaded directly onto test nodes, or test node data to be captured and shifted out for verification. In addition, these devices can be linked into a board-level serial scan path for more board-level testing. The test access port operates with an LVCMOS interface that corresponds to the power supply voltage.

I/O Quick Configuration

To facilitate the most efficient board test, the physical nature of the I/O cells must be set before running any continuity tests. As these tests are fast, by nature, the overhead and time that is required for configuration of the I/Os' physical nature should be minimal so that board test time is minimized. The ispMACH 4000ZE family of devices allows this by offering the user the ability to quickly configure the physical nature of the I/O cells. This quick configuration takes milliseconds to complete, whereas it takes seconds for the entire device to be programmed. Lattice's ispVM[™] System programming software can either perform the quick configuration through the PC parallel port, or can generate the ATE or test vectors necessary for a third-party test system.

IEEE 1532-Compliant In-System Programming

Programming devices in-system provides a number of significant benefits including: rapid prototyping, lower inventory levels, higher quality and the ability to make in-field modifications. All ispMACH 4000ZE devices provide In-System Programming (ISP[™]) capability through the Boundary Scan Test Access Port. This capability has been implemented in a manner that ensures that the port remains complaint to the IEEE 1149.1 standard. By using IEEE 1149.1 as the communication interface through which ISP is achieved, users get the benefit of a standard, welldefined interface. All ispMACH 4000ZE devices are also compliant with the IEEE 1532 standard.

The ispMACH 4000ZE devices can be programmed across the commercial temperature and voltage range. The PC-based Lattice software facilitates in-system programming of ispMACH 4000ZE devices. The software takes the JEDEC file output produced by the design implementation software, along with information about the scan chain, and creates a set of vectors used to drive the scan chain. The software can use these vectors to drive a scan chain via the parallel port of a PC. Alternatively, the software can output files in formats understood by common auto-

mated test equipment. This equipment can then be used to program ispMACH 4000ZE devices during the testing of a circuit board.

User Electronic Signature

The User Electronic Signature (UES) allows the designer to include identification bits or serial numbers inside the device, stored in E²CMOS memory. The ispMACH 4000ZE device contains 32 UES bits that can be configured by the user to store unique data such as ID codes, revision numbers or inventory control codes.

Security Bit

A programmable security bit is provided on the ispMACH 4000ZE devices as a deterrent to unauthorized copying of the array configuration patterns. Once programmed, this bit defeats readback of the programmed pattern by a device programmer, securing proprietary designs from competitors. Programming and verification are also defeated by the security bit. The bit can only be reset by erasing the entire device.

Hot Socketing

The ispMACH 4000ZE devices are well-suited for applications that require hot socketing capability. Hot socketing a device requires that the device, during power-up and down, can tolerate active signals on the I/Os and inputs without being damaged. Additionally, it requires that the effects of I/O pin loading be minimal on active signals. The isp-MACH 4000ZE devices provide this capability for input voltages in the range 0V to 3.0V.

Density Migration

The ispMACH 4000ZE family has been designed to ensure that different density devices in the same package have the same pin-out. Furthermore, the architecture ensures a high success rate when performing design migration from lower density parts to higher density parts. In many cases, it is possible to shift a lower utilization design targeted for a high density device to a lower density device. However, the exact details of the final resource utilization will impact the likely success in each case.

Over Recommended Operating Conditions

 The average DC current drawn by I/Os between adjacent bank GND connections, or between the last GND in an I/O bank and the end of the I/O bank, as shown in the logic signals connection table, shall not exceed n*8mA. Where n is the number of I/Os between bank GND connections or between the last GND in a bank and the end of a bank.

2. For 1.5V inputs, there may be an additional DC current drawn from V_{CC} , if the ispMACH 4000ZE V_{CC} and the V_{CC} of the driving device (V_{CC} d-d; that determines steady state V_{IH}) are in the extreme range of their specifications. Typically, DC current drawn from V_{CC} will be 2µA per input.

Timing Model

The task of determining the timing through the ispMACH 4000ZE family, like any CPLD, is relatively simple. The timing model provided in Figure 16 shows the specific delay paths. Once the implementation of a given function is determined either conceptually or from the software report file, the delay path of the function can easily be determined from the timing model. The Lattice design tools report the timing delays based on the same timing model for a particular design. Note that the internal timing parameters are given for reference only, and are not tested. The external timing parameters are tested and guaranteed for every device. For more information on the timing model and usage, refer to TN1168, jspMACH 4000ZE Timing Model Design and Usage Guidelines.

Revision History

ucBGA packages. Updated ispMACH 4000ZE Power Supply and NC Connections table to include 64-ball ucB and 132-ball ucBGA packages. Added Logic Signal Connections tables for 64-ball ucBGA and 132-ball ucBGA packages.	Date	Version	Change Summary
August 2008 01.2 Data sheet status changed from advance to final. Updated 144 TQFP Logic Signal Connections table. Updated 144 TQFP Logic Signal Connections table. Updated 144 TQFP Logic Signal Connections table. Updated 144 TQFP Logic Signal Connections table. Updated 144 TQFP Logic Signal Connections table. Updated 144 TQFP Logic Signal Connections table. Updated 144 TQFP Logic Signal Connections table. Updated Supply Current table. Updated 144 TQFP Logic Signal Connections table. Updated 144 TQFP Logic Signal Connections table. Updated 144 TQFP Logic Signal Connections table. Updated 144 TQFP Logic Signal Connections table. Dupdated 144 TQFP Logic Signal Connections table. Updated 144 TQFP Logic Signal Connections table. Dupdated 144 TQFP Logic Signal Connections table. Updated Supply Current table. Updated Supply Current table. Updated Internal Timing Parameters. Updated Ordering Information mark format example. Updated Ordering Information mark format example. December 2008 01.3 Updated ispMACH 4000ZE Fower Supply and NC Connections table to include 64-ball ucBGA packages. Updated ispMACH 4000ZE Fower Supply and NC Connections table to include 64-ball ucBGA packages. Updated Logic Signal Connections tables for 64-ball ucBGA packages.	April 2008	01.0	Initial release.
Updated Power Guard for Dedicated Inputs section. Updated DC Electrical Characteristics table. Updated Supply Current table. Updated ispMACH 4000ZE Timing Model. Added new parameters for the Internal Oscillator. Updated 100 TQFP Logic Signal Connections table. Updated 144 csBGA Logic Signal Connections table with LC4128ZE and 4256ZE. Updated 144 rQFP Logic Signal Connections table with LC4128ZE and 4256ZE. Added 144 rQFP Logic Signal Connections table. Updated Supply Current table. Updated External Switching Characteristics. Updated Ordering Information mark format example. December 2008 01.3 Updated ispMACH 4000ZE Family Selection Guide table to include 64-ball ucBGA and 132 ucBGA packages. Updated ispMACH 4000ZE Power Supply and NC Connections table to include 64-ball ucBGA packages. Added Logic Signal Connections tables for 64-ball ucBGA and 132-ball ucBGA packages.	July 2008	01.1	Updated Features bullets.
Image: Provide a state of the state of			Updated typical Hysteresis voltage.
Updated Supply Current table. Updated I/O DC Electrical Characteristics table and note 2. Updated ispMACH 4000ZE Timing Model. Added new parameters for the Internal Oscillator. Updated ORP Reference table. Updated 100 TQFP Logic Signal Connections table. Updated 144 csBGA Logic Signal Connections table with LC4128ZE and 4256ZE. Updated 144 csBGA Logic Signal Connections table with LC4128ZE and 4256ZE. Added 144 TQFP Logic Signal Connections table. Updated Supply Current table. Updated Supply Current table. Updated Supply Current table. Updated Supply Current table. Updated Internal Timing Parameters. Updated Ordering Information mark format example. Updated SupACH 4000ZE Family Selection Guide table to include 64-ball ucBGA and 132-ball ucBGA packages. Added Logic Signal Connections tables for 64-ball ucBGA and 132-ball ucBGA packages.			Updated Power Guard for Dedicated Inputs section.
Image: December 2008 01.3 Updated ispMACH 4000ZE Timing Model. Added new parameters for the Internal Oscillator. Updated ORP Reference table. Updated 100 TQFP Logic Signal Connections table. Updated 100 TQFP Logic Signal Connections table with LC4128ZE and 4256ZE. Updated 144 csBGA Logic Signal Connections table. Updated 144 csBGA Logic Signal Connections table. August 2008 01.2 Data sheet status changed from advance to final. Updated Internal Timing Parameters. Updated Internal Timing Parameters. Updated Ordering Information mark format example. Updated spMACH 4000ZE Family Selection Guide table to include 64-ball ucBGA and 132 ucBGA packages. Added Logic Signal Connections tables for 64-ball ucBGA and 132-ball ucBGA packages. December 2008 and 132-ball ucBGA packages.			Updated DC Electrical Characteristics table.
Updated ispMACH 4000ZE Timing Model. Added new parameters for the Internal Oscillator. Updated ORP Reference table. Updated 100 TQFP Logic Signal Connections table. Updated 144 csBGA Logic Signal Connections table with LC4128ZE and 4256ZE. Updated 144 rQFP Logic Signal Connections table with LC4128ZE and 4256ZE. Added 144 TQFP Logic Signal Connections table. August 2008 01.2 Data sheet status changed from advance to final. Updated Supply Current table. Updated Internal Timing Parameters. Updated Ordering Information mark format example. December 2008 01.3 Updated ispMACH 4000ZE Family Selection Guide table to include 64-ball ucBGA and 132 ucBGA packages. Updated Logic Signal Connections tables for 64-ball ucBGA and 132-ball ucBGA packages.			Updated Supply Current table.
Added new parameters for the Internal Oscillator. Updated ORP Reference table. Updated Power Supply and NC Connections table. Updated 100 TQFP Logic Signal Connections table with LC4128ZE and 4256ZE. Updated 144 csBGA Logic Signal Connections table with LC4128ZE and 4256ZE. Added 144 TQFP Logic Signal Connections table with LC4128ZE and 4256ZE. Added 144 TQFP Logic Signal Connections table with LC4128ZE and 4256ZE. Added 144 TQFP Logic Signal Connections table. August 2008 01.2 Data sheet status changed from advance to final. Updated Supply Current table. Updated Internal Timing Parameters. Updated Ordering Information mark format example. December 2008 01.3 Updated ispMACH 4000ZE Family Selection Guide table to include 64-ball ucBGA and 132-ball ucBGA packages. Added Logic Signal Connections tables for 64-ball ucBGA and 132-ball ucBGA packages.			Updated I/O DC Electrical Characteristics table and note 2.
December 2008 01.3 Updated ispMACH 400ZE Power Supply and Power Supply Supply Currections table with LC4128ZE and 4256ZE. August 2008 01.2 Data sheet status changed from advance to final. Updated Supply Current table. Updated External Switching Characteristics. Updated Power Consumption graph and Power Estimation Coefficients table. Updated Ordering Information mark format example. December 2008 01.3 Updated ispMACH 4000ZE Power Supply and NC Connections table to include 64-ball ucBGA packages. Added Logic Signal Connections tables for 64-ball ucBGA and 132-ball ucBGA packages.			Updated ispMACH 4000ZE Timing Model.
Updated Power Supply and NC Connections table. Updated 100 TQFP Logic Signal Connections table with LC4128ZE and 4256ZE. Updated 144 csBGA Logic Signal Connections table with LC4128ZE and 4256ZE. Added 144 TQFP Logic Signal Connections table. August 2008 01.2 Data sheet status changed from advance to final. Updated Supply Current table. Updated Internal Timing Parameters. Updated Ordering Information mark format example. December 2008 01.3 Updated ispMACH 4000ZE Family Selection Guide table to include 64-ball ucBGA and 132-ball ucBGA packages. Updated Logic Signal Connections tables for 64-ball ucBGA and 132-ball ucBGA packages.			Added new parameters for the Internal Oscillator.
