Welcome to E-XFL.COM

Understanding Embedded - CPLDs (Complex Programmable Logic Devices)

Embedded - CPLDs, or Complex Programmable Logic Devices, are highly versatile digital logic devices used in electronic systems. These programmable components are designed to perform complex logical operations and can be customized for specific applications. Unlike fixed-function ICs, CPLDs offer the flexibility to reprogram their configuration, making them an ideal choice for various embedded systems. They consist of a set of logic gates and programmable interconnects, allowing designers to implement complex logic circuits without needing custom hardware.

Applications of Embedded - CPLDs

Details	
Product Status	Active
Programmable Type	In System Programmable
Delay Time tpd(1) Max	7.5 ns
Voltage Supply - Internal	1.7V ~ 1.9V
Number of Logic Elements/Blocks	4
Number of Macrocells	64
Number of Gates	-
Number of I/O	32
Operating Temperature	-40°C ~ 105°C (TJ)
Mounting Type	Surface Mount
Package / Case	48-LQFP
Supplier Device Package	48-TQFP (7x7)
Purchase URL	https://www.e-xfl.com/product-detail/lattice-semiconductor/lc4064ze-7tn48i

The I/Os in the ispMACH 4000ZE are split into two banks. Each bank has a separate I/O power supply. Inputs can support a variety of standards independent of the chip or bank power supply. Outputs support the standards compatible with the power supply provided to the bank. Support for a variety of standards helps designers implement designs in mixed voltage environments. In addition, 5V tolerant inputs are specified within an I/O bank that is connected to a V_{CCO} of 3.0V to 3.6V for LVCMOS 3.3, LVTTL and PCI interfaces.

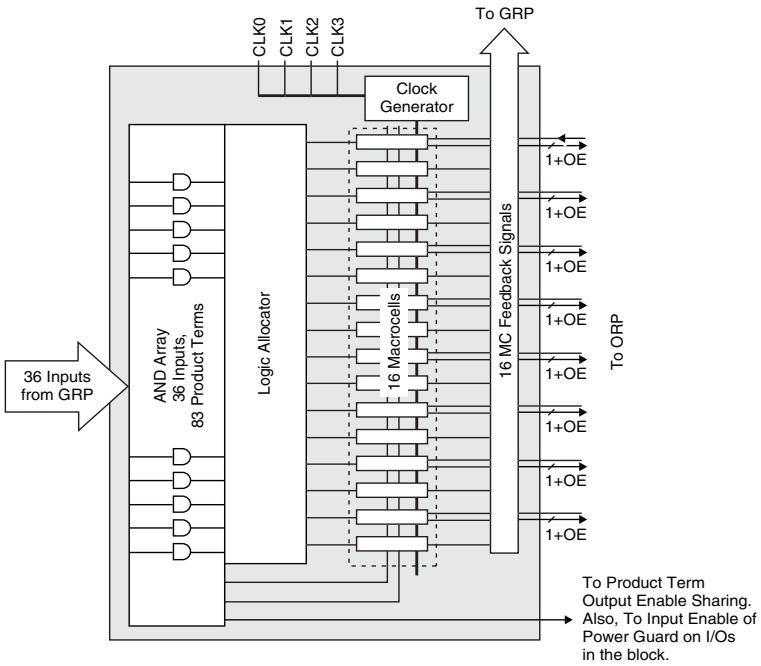
Architecture

There are a total of two GLBs in the ispMACH 4032ZE, increasing to 16 GLBs in the ispMACH 4256ZE. Each GLB has 36 inputs. All GLB inputs come from the GRP and all outputs from the GLB are brought back into the GRP to be connected to the inputs of any other GLB on the device. Even if feedback signals return to the same GLB, they still must go through the GRP. This mechanism ensures that GLBs communicate with each other with consistent and predictable delays. The outputs from the GLB are also sent to the ORP. The ORP then sends them to the associated I/O cells in the I/O block.

Generic Logic Block

The ispMACH 4000ZE GLB consists of a programmable AND array, logic allocator, 16 macrocells and a GLB clock generator. Macrocells are decoupled from the product terms through the logic allocator and the I/O pins are decoupled from macrocells through the ORP. Figure 2 illustrates the GLB.

Figure 2. Generic Logic Block



AND Array

The programmable AND Array consists of 36 inputs and 83 output product terms. The 36 inputs from the GRP are used to form 72 lines in the AND Array (true and complement of the inputs). Each line in the array can be connected to any of the 83 output product terms via a wired-AND. Each of the 80 logic product terms feed the logic allocator with the remaining three control product terms feeding the Shared PT Clock, Shared PT Initialization and Shared PT OE. The Shared PT Clock and Shared PT Initialization signals can optionally be inverted before being fed to the macrocells.

Every set of five product terms from the 80 logic product terms forms a product term cluster starting with PT0. There is one product term cluster for every macrocell in the GLB. Figure 3 is a graphical representation of the AND Array.

Table 4. Product Term Expansion Capability

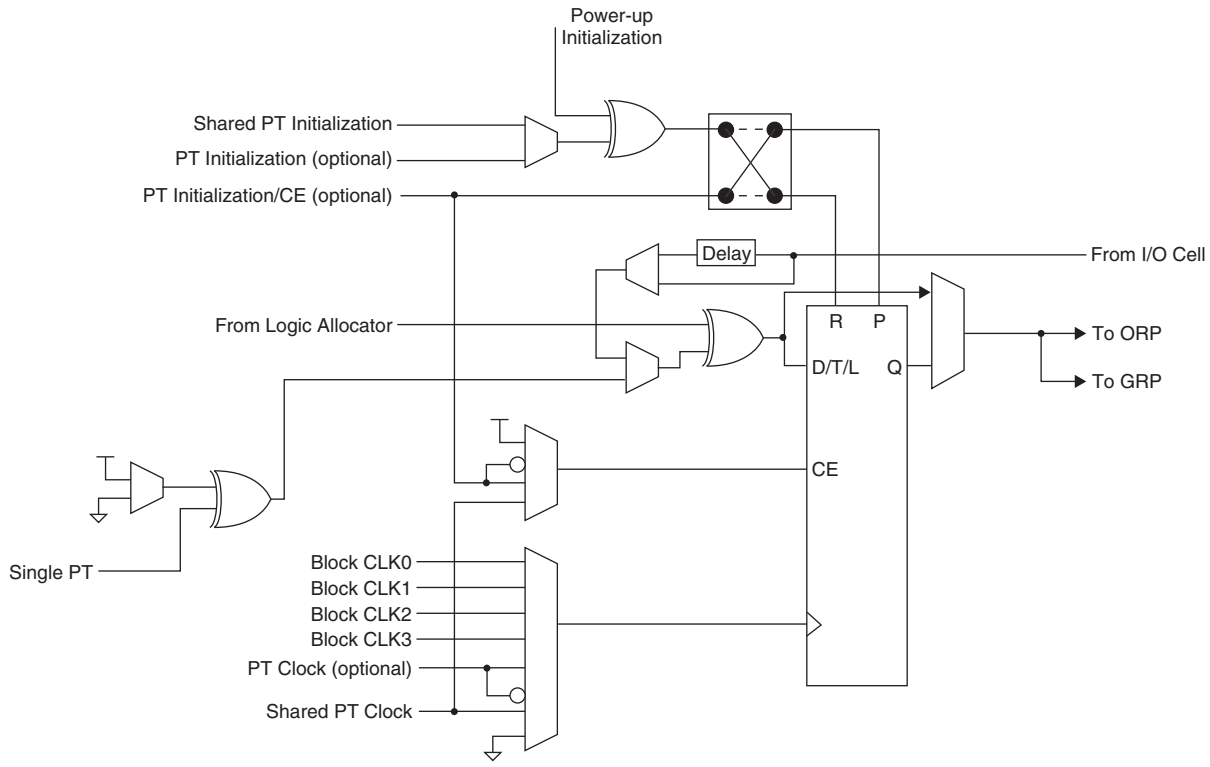
Expansion Chains	Macrocells Associated with Expansion Chain (with Wrap Around)	Max PT/ Macrocell
Chain-0	M0 Õ M4 Õ M8 Õ M12 Õ M0	75
Chain-1	M1 Õ M5 Õ M9 Õ M13 Õ M1	80
Chain-2	M2 Õ M6 Õ M10 Õ M14 Õ M2	75
Chain-3	M3 Õ M7 Õ M11 Õ M15 Õ M3	70

Every time the super cluster allocator is used, there is an incremental delay of t_{EXP}. When the super cluster allocator is used, all destinations other than the one being steered to, are given the value of ground (i.e., if the super cluster is steered to M (n+4), then M (n) is ground).

Macrocell

The 16 macrocells in the GLB are driven by the 16 outputs from the logic allocator. Each macrocell contains a programmable XOR gate, a programmable register/latch, along with routing for the logic and control functions. Figure 5 shows a graphical representation of the macrocell. The macrocells feed the ORP and GRP. A direct input from the I/O cell allows designers to use the macrocell to construct high-speed input registers. A programmable delay in this path allows designers to choose between the fastest possible set-up time and zero hold time.

Figure 5. Macrocell



Enhanced Clock Multiplexer

The clock input to the flip-flop can select any of the four block clocks along with the shared PT clock, and true and complement forms of the optional individual term clock. An 8:1 multiplexer structure is used to select the clock. The eight sources for the clock multiplexer are as follows:

- Block CLK0
- Block CLK1

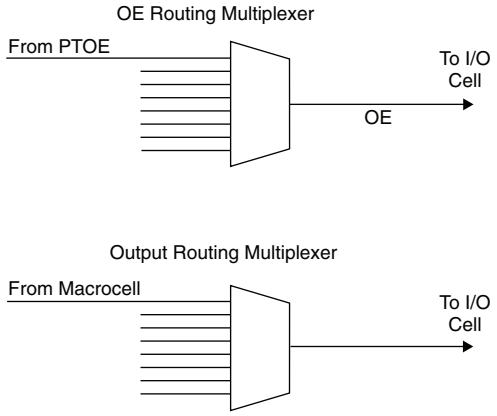
Output Routing Pool (ORP)

The Output Routing Pool allows macrocell outputs to be connected to any of several I/O cells within an I/O block. This provides greater flexibility in determining the pinout and allows design changes to occur without affecting the pinout. The output routing pool also provides a parallel capability for routing macrocell-level OE product terms. This allows the OE product term to follow the macrocell output as it is switched between I/O cells. The enhanced ORP of the ispMACH 4000ZE family consists of the following elements:

- Output Routing Multiplexers
- OE Routing Multiplexers

Figure 7 shows the structure of the ORP from the I/O cell perspective. This is referred to as an ORP slice. Each ORP has as many ORP slices as there are I/O cells in the corresponding I/O block.

Figure 7. ORP Slice



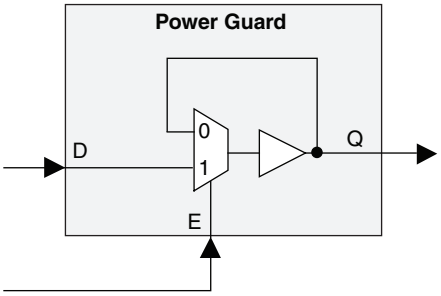
Output Routing Multiplexers

The details of connections between the macrocells and the I/O cells vary across devices and within a device dependent on the maximum number of I/Os available. Tables 5-7 provide the connection details.

Table 5. GLB/MC/ORP Combinations for ispMACH 4256ZE

GLB/MC	ORP Mux Input Macrocells
[GLB] [MC 0]	M0, M1, M2, M3, M4, M5, M6, M7
[GLB] [MC 1]	M2, M3, M4, M5, M6, M7, M8, M9
[GLB] [MC 2]	M4, M5, M6, M7, M8, M9, M10, M11
[GLB] [MC 3]	M6, M7, M8, M9, M10, M11, M12, M13
[GLB] [MC 4]	M8, M9, M10, M11, M12, M13, M14, M15
[GLB] [MC 5]	M10, M11, M12, M13, M14, M15, M0, M1
[GLB] [MC 6]	M12, M13, M14, M15, M0, M1, M2, M3
[GLB] [MC 7]	M14, M15, M0, M1, M2, M3, M4, M5

Figure 9. Power Guard

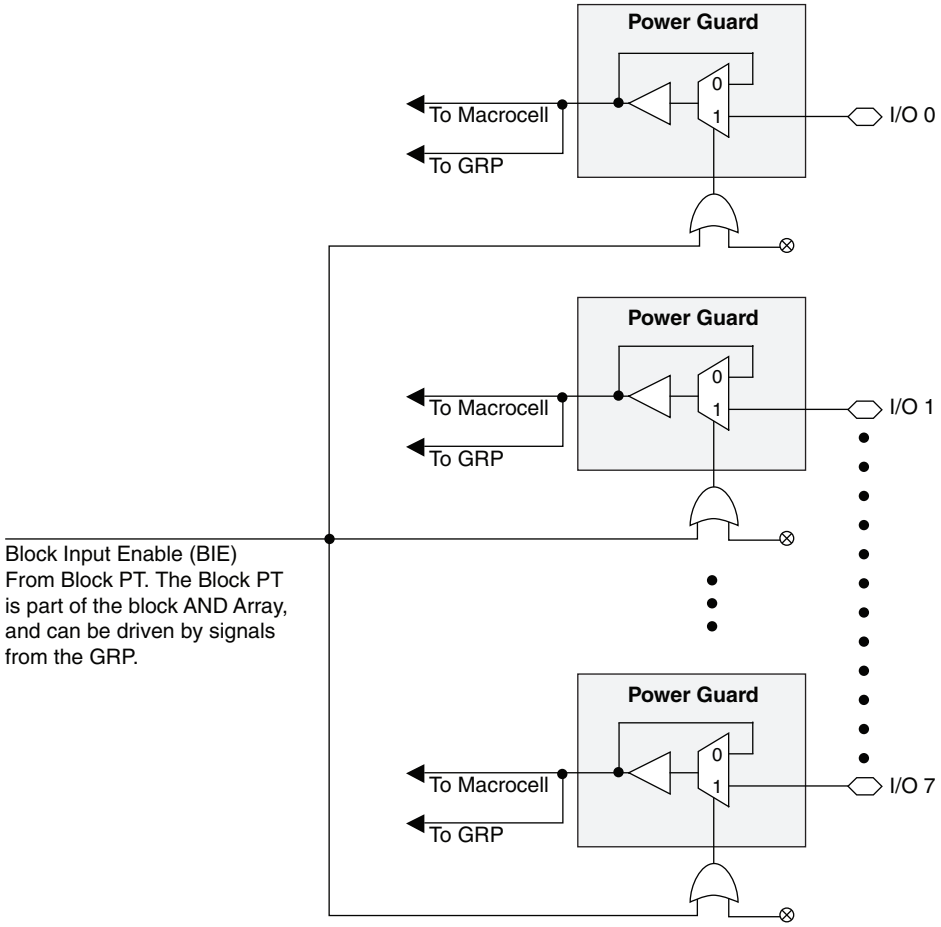


All the I/O pins in a block share a common Power Guard Enable signal. For a block of I/Os, this signal is called a Block Input Enable (BIE) signal. BIE can be internally generated using MC logic, or could come from external sources using one of the user I/O or input pins.

Any I/O pin in the block can be programmed to ignore the BIE signal. Thus, the feature can be enabled or disabled on a pin-by-pin basis.

Figure 10 shows Power Guard and BIE across multiple I/Os in a block that has eight I/Os.

Figure 10. Power Guard and BIE in a Block with 8 I/Os



The number of BIE inputs, thus the number of Power Guard “Blocks” that can exist in a device, depends on the device size. Table 8 shows the number of BIE signals available in the ispMACH 4000ZE family. The number of I/Os available in each block is shown in the Ordering Information section of this data sheet.

Table 8. Number of BIE Signals Available in ispMACH 4000ZE Devices

Device	Number of Logic Blocks, Power Guard Blocks and BIE Signals
ispMACH 4032ZE	Two (Blocks: A and B)
ispMACH 4064ZE	Four (Blocks: A, B, C and D)
ispMACH 4128ZE	Eight (Blocks: A, B, C, …, H)
ispMACH 4256ZE	Sixteen (Blocks: A, B, C, …, P)

Power Guard for Dedicated Inputs

Power Guard can optionally be applied to the dedicated inputs. The dedicated inputs and clocks are controlled by the BIE of the logic blocks shown in Tables 9 and 10.

Table 9. Dedicated Clock Inputs to BIE Association

CLK/I	32 MC Block	64MC Block	128MC Block	256MC Block
CLK0 / I	A	A	A	A
CLK1 / I	A	B	D	H
CLK2 / I	B	C	E	I
CLK3 / I	B	D	H	P

Table 10. Dedicated Inputs to BIE Association

Dedicated Input	4064ZE Block	4128ZE Block	4256ZE Block
0	A	B	D
1	B	C	E
2	B	D	G
3	C	F	G
4	D	G	J
5	D	H	L
6	—	—	M
7	—	—	O
8	—	—	O
9	—	—	B

For more information on the Power Guard function refer to TN1174, Advanced Features of the ispMACH 4000ZE Family.

Global OE (GOE) and Block Input Enable (BIE) Generation

Most ispMACH 4000ZE family devices have a 4-bit wide Global OE (GOE) Bus (Figure 11), except the ispMACH 4032 device that has a 2-bit wide Global OE Bus (Figure 12). This bus is derived from a 4-bit internal global OE (GOE) PT bus and two dual purpose I/O or GOE pins. Each signal that drives the bus can optionally be inverted.

Each GLB has a block-level OE PT that connects to all bits of the Global OE PT bus with four fuses. Hence, for a 256-macrocell device (with 16 blocks), each line of the bus is driven from 16 OE product terms. Figures 9 and 10 show a graphical representation of the global OE generation.

mated test equipment. This equipment can then be used to program ispMACH 4000ZE devices during the testing of a circuit board.

User Electronic Signature

The User Electronic Signature (UES) allows the designer to include identification bits or serial numbers inside the device, stored in E^2CMOS memory. The ispMACH 4000ZE device contains 32 UES bits that can be configured by the user to store unique data such as ID codes, revision numbers or inventory control codes.

Security Bit

A programmable security bit is provided on the ispMACH 4000ZE devices as a deterrent to unauthorized copying of the array configuration patterns. Once programmed, this bit defeats readback of the programmed pattern by a device programmer, securing proprietary designs from competitors. Programming and verification are also defeated by the security bit. The bit can only be reset by erasing the entire device.

Hot Socketing

The ispMACH 4000ZE devices are well-suited for applications that require hot socketing capability. Hot socketing a device requires that the device, during power-up and down, can tolerate active signals on the I/Os and inputs without being damaged. Additionally, it requires that the effects of I/O pin loading be minimal on active signals. The ispMACH 4000ZE devices provide this capability for input voltages in the range 0V to 3.0V.

Density Migration

The ispMACH 4000ZE family has been designed to ensure that different density devices in the same package have the same pin-out. Furthermore, the architecture ensures a high success rate when performing design migration from lower density parts to higher density parts. In many cases, it is possible to shift a lower utilization design targeted for a high density device to a lower density device. However, the exact details of the final resource utilization will impact the likely success in each case.

Absolute Maximum Ratings[1, 2, 3, 4]

Supply Voltage (V_{CC}) . . . . . -0.5 to 2.5V

Output Supply Voltage (V_{CCO}) . . . . . -0.5 to 4.5V

Input or I/O Tristate Voltage Applied[5, 6] . . . . . -0.5 to 5.5V

Storage Temperature . . . . . -65 to 150°C

Junction Temperature (T_j) with Power Applied . . . -55 to 150°C

1. Stress above those listed under the "Absolute Maximum Ratings" may cause permanent damage to the device. Functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.
2. Compliance with Lattice Thermal Management document is required.
3. All voltages referenced to GND.
4. Please refer to the Lattice ispMACH 4000V/B/C/ZC/ZE Product Family Qualification Summary for complete data, including the ESD performance data.
5. Undershoot of -2V and overshoot of (V_{IH} (MAX) + 2V), up to a total pin voltage of 6V is permitted for a duration of <20ns.
6. Maximum of 64 I/Os per device with VIN > 3.6V is allowed.

Recommended Operating Conditions

Symbol	Parameter		Min.	Max.	Units
V_{CC}	Supply Voltage	Standard Voltage Operation	1.7	1.9	V
		Extended Voltage Operation	1.6[1]	1.9	V
T_j	Junction Temperature (Commercial)		0	90	°C
	Junction Temperature (Industrial)		-40	105	°C

1. Devices operating at 1.6V can expect performance degradation up to 35%.

Erase Reprogram Specifications

Parameter	Min.	Max.	Units
Erase/Reprogram Cycle	1,000	—	Cycles

Note: Valid over commercial temperature range.

Hot Socketing Characteristics[1,2,3]

Symbol	Parameter	Condition	Min.	Typ.	Max.	Units
I_{DK}	Input or I/O Leakage Current	$0 \le V_{IN} \le 3.0V$, Tj = 105°C	—	±30	±150	µA
		$0 \le V_{IN} \le 3.0V$, Tj = 130°C	—	±30	±200	µA

1. Insensitive to sequence of V_{CC} or V_{CCO}. However, assumes monotonic rise/fall rates for V_{CC} and V_{CCO}, provided (V_{IN} - V_{CCO}) ≤ 3.6V.
2. $0 < V_{CC} < V_{CC}$ (MAX), $0 < V_{CCO} < V_{CCO}$ (MAX).
3. I_{DK} is additive to I_{PU}, I_{PD} or I_{BH}. Device defaults to pull-up until fuse circuitry is active.

I/O Recommended Operating Conditions

Standard	V_{CCO} (V)[1]	
	Min.	Max.
LVTTL	3.0	3.6
LVCMOS 3.3	3.0	3.6
Extended LVCMOS 3.3	2.7	3.6
LVCMOS 2.5	2.3	2.7
LVCMOS 1.8	1.65	1.95
LVCMOS 1.5	1.4	1.6
PCI 3.3	3.0	3.6

1. Typical values for V_{CCO} are the average of the min. and max. values.

DC Electrical Characteristics

Over Recommended Operating Conditions

Symbol	Parameter	Condition	Min.	Typ.	Max.	Units
I_{IL}, I_{IH}[1, 2]	Input Leakage Current	$0 \le V_{IN} < V_{CCO}$	—	0.5	1	µA
I_{IH}[1]	Input High Leakage Current	$V_{CCO} < V_{IN} \le 5.5V$	—	—	10	µA
I_{PU}	I/O Weak Pull-up Resistor Current	$0 \le V_{IN} \le 0.7V_{CCO}$	-20	—	-150	µA
I_{PD}	I/O Weak Pull-down Resistor Current	V_{IL} (MAX) $\le V_{IN} \le V_{IH}$ (MAX)	30	—	150	µA
I_{BHLS}	Bus Hold Low Sustaining Current	$V_{IN} = V_{IL}$ (MAX)	30	—	—	µA
I_{BHHS}	Bus Hold High Sustaining Current	$V_{IN} = 0.7\ V_{CCO}$	-20	—	—	µA
I_{BHLO}	Bus Hold Low Overdrive Current	$0V \le V_{IN} \le V_{BHT}$	—	—	150	µA
I_{BHHO}	Bus Hold High Overdrive Current	$V_{BHT} \le V_{IN} \le V_{CCO}$	—	—	-150	µA
V_{BHT}	Bus Hold Trip Points	—	V_{CCO} * 0.35	—	V_{CCO} * 0.65	V
C_1	I/O Capacitance[3]	V_{CCO} = 3.3V, 2.5V, 1.8V, 1.5V	—	8	—	pf
		V_{CC} = 1.8V, V_{IO} = 0 to V_{IH} (MAX)	—		—	
C_2	Clock Capacitance[3]	V_{CCO} = 3.3V, 2.5V, 1.8V, 1.5V	—	6	—	pf
		V_{CC} = 1.8V, V_{IO} = 0 to V_{IH} (MAX)	—		—	
C_3	Global Input Capacitance[3]	V_{CCO} = 3.3V, 2.5V, 1.8V, 1.5V	—	6	—	pf
		V_{CC} = 1.8V, V_{IO} = 0 to V_{IH} (MAX)	—		—	

1. Input or I/O leakage current is measured with the pin configured as an input or as an I/O with the output driver tristated. It is not measured with the output driver active. Bus maintenance circuits are disabled.
2. I_{IH} excursions of up to 1.5µA maximum per pin above the spec limit may be observed for certain voltage conditions on no more than 10% of the device's I/O pins.
3. Measured T_A = 25°C, f = 1.0MHz.

Supply Current

To minimize transient current during power-on, configure CPLD I/Os to a pull-up or float state. If this logic scenario is not possible, then the recommended power sequence should assert VCC and VCCO at the same time or VCC before VCCO.

1. Frequency = 1.0 MHz.
2. Device configured with 16-bit counters.
3. I_{CC} varies with specific device configuration and operating frequency.
4. V_{CCO} = 3.6V, V_{IN} = 0V or V_{CCO}, bus maintenance turned off. V_{IN} above V_{CCO} will add transient current above the specified standby I_{CC}.
5. Includes V_{CCO} current without output loading.
6. This operating supply current is with the internal oscillator disabled. Enabling the internal oscillator adds approximately 15µA typical current plus additional current from any logic it drives.

Timing Model

The task of determining the timing through the ispMACH 4000ZE family, like any CPLD, is relatively simple. The timing model provided in Figure 16 shows the specific delay paths. Once the implementation of a given function is determined either conceptually or from the software report file, the delay path of the function can easily be determined from the timing model. The Lattice design tools report the timing delays based on the same timing model for a particular design. Note that the internal timing parameters are given for reference only, and are not tested. The external timing parameters are tested and guaranteed for every device. For more information on the timing model and usage, refer to TN1168, ispMACH 4000ZE Timing Model Design and Usage Guidelines.
