### Understanding [Embedded - CPLDs \(Complex Programmable Logic Devices\)](#)

Embedded - CPLDs, or Complex Programmable Logic Devices, are highly versatile digital logic devices used in electronic systems. These programmable components are designed to perform complex logical operations and can be customized for specific applications. Unlike fixed-function ICs, CPLDs offer the flexibility to reprogram their configuration, making them an ideal choice for various embedded systems. They consist of a set of logic gates and programmable interconnects, allowing designers to implement complex logic circuits without needing custom hardware.

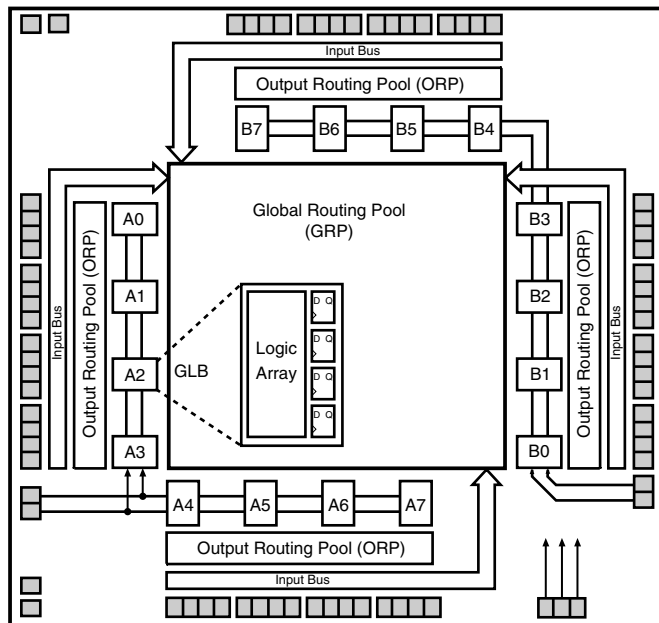

### Applications of Embedded - CPLDs

Details	
Product Status	Obsolete
Programmable Type	In System Programmable
Delay Time tpd(1) Max	7.5 ns
Voltage Supply - Internal	4.75V ~ 5.25V
Number of Logic Elements/Blocks	16
Number of Macrocells	64
Number of Gates	2000
Number of I/O	64
Operating Temperature	0°C ~ 70°C (TA)
Mounting Type	Surface Mount
Package / Case	100-LQFP
Supplier Device Package	100-TQFP (14x14)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/lattice-semiconductor/isplsi-2064e-135lt100">https://www.e-xfl.com/product-detail/lattice-semiconductor/isplsi-2064e-135lt100</a>

## Features

- **SuperFAST HIGH DENSITY IN-SYSTEM PROGRAMMABLE LOGIC**
  - 2000 PLD Gates
  - 64 I/O Pins, Four Dedicated Inputs
  - 64 Registers
  - High Speed Global Interconnect
  - Wide Input Gating for Fast Counters, State Machines, Address Decoders, etc.
  - Small Logic Block Size for Random Logic
  - 100% Functionally and JEDEC Upward Compatible with ispLSI 2064 Devices
- **HIGH PERFORMANCE E<sup>2</sup>CMOS<sup>®</sup> TECHNOLOGY**
  - $f_{max} = 200$  MHz Maximum Operating Frequency
  - $t_{pd} = 4.5$  ns Propagation Delay
  - TTL Compatible Inputs and Outputs
  - 5V Programmable Logic Core
  - ispJTAG<sup>™</sup> In-System Programmable via IEEE 1149.1 (JTAG) Test Access Port
  - User-Selectable 3.3V or 5V I/O Supports Mixed Voltage Systems
  - PCI Compatible Outputs
  - Open-Drain Output Option
  - Electrically Erasable and Reprogrammable
  - Non-Volatile
  - Unused Product Term Shutdown Saves Power
- **ispLSI OFFERS THE FOLLOWING ADDED FEATURES**
  - Increased Manufacturing Yields, Reduced Time-to-Market and Improved Product Quality
  - Reprogram Soldered Devices for Faster Prototyping
- **OFFERS THE EASE OF USE AND FAST SYSTEM SPEED OF PLDs WITH THE DENSITY AND FLEXIBILITY OF FIELD PROGRAMMABLE GATE ARRAYS**
  - Complete Programmable Device Can Combine Glue Logic and Structured Designs
  - Enhanced Pin Locking Capability
  - Three Dedicated Clock Input Pins
  - Synchronous and Asynchronous Clocks
  - Programmable Output Slew Rate Control to Minimize Switching Noise
  - Flexible Pin Placement
  - Optimized Global Routing Pool Provides Global Interconnectivity

## Functional Block Diagram

0139/2064E

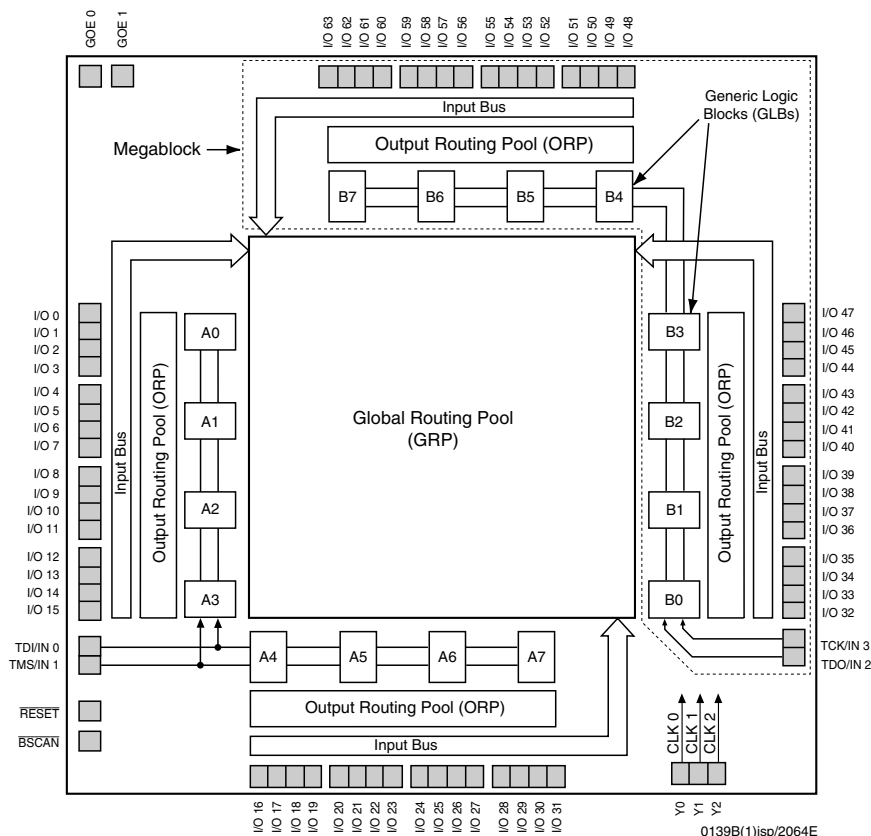

## Description

The ispLSI 2064E is a High Density Programmable Logic Device. The device contains 64 Registers, 64 Universal I/O pins, four Dedicated Input Pins, three Dedicated Clock Input Pins, two dedicated Global OE input pins and a Global Routing Pool (GRP). The GRP provides complete interconnectivity between all of these elements. The ispLSI 2064E features 5V in-system programmability and in-system diagnostic capabilities. The ispLSI 2064E offers non-volatile reprogrammability of the logic, as well as the interconnect to provide truly reconfigurable systems.

The basic unit of logic on the ispLSI 2064E device is the Generic Logic Block (GLB). The GLBs are labeled A0, A1 .. B7 (see Figure 1). There are a total of 16 GLBs in the ispLSI 2064E device. Each GLB is made up of four macrocells. Each GLB has 18 inputs, a programmable AND/OR/Exclusive OR array, and four outputs which can be configured to be either combinatorial or registered. Inputs to the GLB come from the GRP and dedicated inputs. All of the GLB outputs are brought back into the GRP so that they can be connected to the inputs of any GLB on the device.

## Functional Block Diagram

Figure 1. ispLSI 2064E Functional Block Diagram

The device also has 64 I/O cells, each of which is directly connected to an I/O pin. Each I/O cell can be individually programmed to be a combinatorial input, output or bi-directional I/O pin with 3-state control. The signal levels are TTL compatible voltages and the output drivers can source 4 mA or sink 8 mA. Each output can be programmed independently for fast or slow output slew rate to minimize overall output switching noise. By connecting the VCCIO pins to a common 5V or 3.3V power supply, I/O output levels can be matched to 5V or 3.3V compatible voltages. When connected to a 5V supply, the I/O pins provide PCI-compatible output drive.

Eight GLBs, 32 I/O cells, two dedicated inputs and two ORPs are connected together to make a Megablock (see Figure 1). The outputs of the eight GLBs are connected to a set of 32 universal I/O cells by two ORPs. Each ispLSI 2064E device contains two Megablocks.

The GRP has as its inputs, the outputs from all of the GLBs and all of the inputs from the bi-directional I/O cells. All of these signals are made available to the inputs of the

GLBs. Delays through the GRP have been equalized to minimize timing skew.

Clocks in the ispLSI 2064E device are selected using the dedicated clock pins. Three dedicated clock pins (Y0, Y1, Y2) or an asynchronous clock can be selected on a GLB basis. The asynchronous or Product Term clock can be generated in any GLB for its own clock.

### Programmable Open-Drain Outputs

In addition to the standard output configuration, the outputs of the ispLSI 2064E are individually programmable, either as a standard totem-pole output or an open-drain output. The totem-pole output drives the specified  $V_{oh}$  and  $V_{ol}$  levels, whereas the open-drain output drives only the specified  $V_{ol}$ . The  $V_{oh}$  level on the open-drain output depends on the external loading and pull-up. This output configuration is controlled by a programmable fuse. The default configuration when the device is in bulk erased state is totem-pole configuration. The open-drain/totem-pole option is selectable through the Lattice software tools.

## Absolute Maximum Ratings <sup>1</sup>

Supply Voltage  $V_{CC}$  ..... -0.5 to +7.0V  
 Input Voltage Applied ..... -2.5 to  $V_{CC} + 1.0V$   
 Off-State Output Voltage Applied ..... -2.5 to  $V_{CC} + 1.0V$   
 Storage Temperature ..... -65 to 150°C  
 Case Temp. with Power Applied ..... -55 to 125°C  
 Max. Junction Temp. ( $T_J$ ) with Power Applied ..... 150°C

1. Stresses above those listed under the “Absolute Maximum Ratings” may cause permanent damage to the device. Functional operation of the device at these or at any other conditions above those indicated in the operational sections of this specification is not implied (while programming, follow the programming specifications).

## DC Recommended Operating Condition

SYMBOL	PARAMETER	MIN.	MAX.	UNITS
$V_{CC}$	Supply Voltage: Logic Core, Input Buffers $T_A = 0^\circ C$ to $+70^\circ C$	4.75	5.25	V
$V_{CCIO}$	Supply Voltage: Output Drivers 5V	4.75	5.25	V
	3.3V	3.0	3.6	V
$V_{IL}$	Input Low Voltage	0	0.8	V
$V_{IH}$	Input High Voltage	2.0	$V_{CC} + 1$	V

Table 2-0005/2096E

## Capacitance ( $T_A = 25^\circ C$ , $f = 1.0$ MHz)

SYMBOL	PARAMETER	TYPICAL	UNITS	TEST CONDITIONS
$C_1$	Dedicated Input Capacitance	8	pf	$V_{CC} = 5.0V$ , $V_{IN} = 2.0V$
$C_2$	I/O Capacitance	8	pf	$V_{CC} = 5.0V$ , $V_{IO} = 2.0V$
$C_3$	Clock Capacitance	10	pf	$V_{CC} = 5.0V$ , $V_Y = 2.0V$

Table 2-0006/2064e

## Erase/Reprogram Specification

PARAMETER	MINIMUM	MAXIMUM	UNITS
Erase/Reprogram Cycles	10,000	—	Cycles

Table 2-0008/2064e

## Switching Test Conditions

Input Pulse Levels	GND to 3.0V
Input Rise and Fall Time 10% to 90%	1.5 ns
Input Timing Reference Levels	1.5V
Output Timing Reference Levels	1.5V
Output Load	See Figure 2

3-state levels are measured 0.5V from steady-state active level.

Table 2-0003/2064E

## Output Load Conditions (see Figure 2)

TEST CONDITION		R1	R2	CL
A		470Ω	390Ω	35pF
B	Active High	∞	390Ω	35pF
	Active Low	470Ω	390Ω	35pF
C	Active High to Z at $V_{OH}-0.5V$	∞	390Ω	5pF
	Active Low to Z at $V_{OL}+0.5V$	470Ω	390Ω	5pF

Table 2-0004/2064

Figure 2. Test Load

\* $C_L$  includes Test Fixture and Probe Capacitance.

## DC Electrical Characteristics

### Over Recommended Operating Conditions

SYMBOL	PARAMETER	CONDITION	MIN.	TYP. <sup>3</sup>	MAX.	UNITS
<b>V<sub>OL</sub></b>	Output Low Voltage	$I_{OL} = 8 \text{ mA}$	—	—	0.4	V
<b>V<sub>OH</sub></b>	Output High Voltage	$I_{OH} = -4 \text{ mA}$	2.4	—	—	V
<b>I<sub>IL</sub></b>	Input or I/O Low Leakage Current	$0V \leq V_{IN} \leq V_{IL} \text{ (Max.)}$	—	—	-10	μA
<b>I<sub>IH</sub></b>	Input or I/O High Leakage Current	$(V_{CCIO} - 0.2)V \leq V_{IN} \leq V_{CCIO}$	—	—	10	μA
		$V_{CCIO} \leq V_{IN} \leq 5.25V$	—	—	10	μA
<b>I<sub>IL-PU</sub></b>	I/O Active Pull-Up Current	$0V \leq V_{IN} \leq 2.0V$	-10	—	-250	μA
<b>I<sub>OS</sub><sup>1</sup></b>	Output Short Circuit Current	$V_{CCIO} = 5.0V \text{ or } 3.3V, V_{OUT} = 0.5V$	—	—	-240	mA
<b>I<sub>CC</sub><sup>2,4,5</sup></b>	Operating Power Supply Current	$V_{IL} = 0.0V, V_{IH} = 3.0V$ $f_{TOGGLE} = 1 \text{ MHz}$	—	100	—	mA

Table 2-0007/2064E

- One output at a time for a maximum duration of one second.  $V_{OUT} = 0.5V$  was selected to avoid test problems by tester ground degradation. Characterized but not 100% tested.
- Measured using four 16-bit counters.
- Typical values are at  $V_{CC} = 5V$  and  $T_A = 25^\circ C$ .
- Unused inputs held at 0.0V.
- Maximum  $I_{CC}$  varies widely with specific device configuration and operating frequency. Refer to the Power Consumption section of this data sheet and the Thermal Management section of the Lattice Semiconductor Data Book or CD-ROM to estimate maximum  $I_{CC}$ .

## External Timing Parameters

 7.9\text{ns} &= (0.5 + 0.6 + 4.0) + (0.3) + (0.9 + 1.6)
 \end{aligned}$$

Table 2- 0042A-2064e

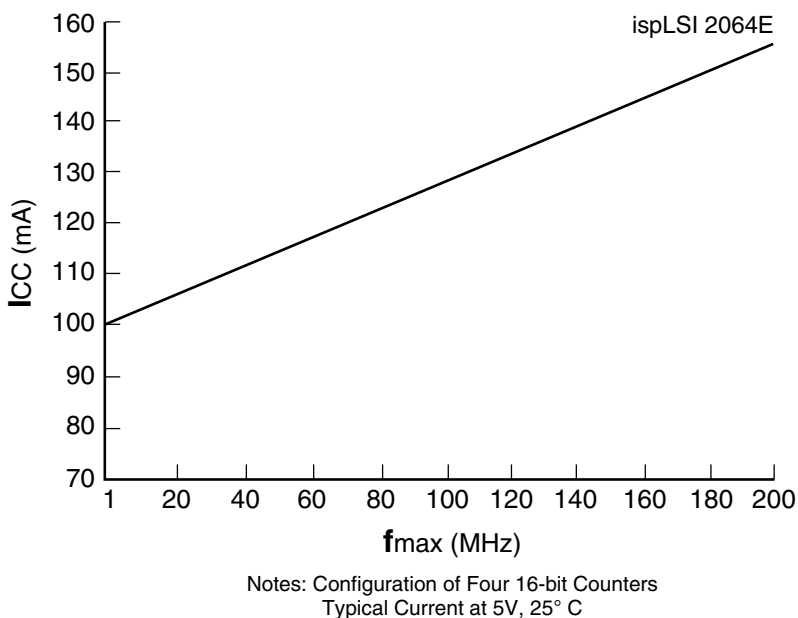

Note: Calculations are based upon timing specifications for the ispLSI 2064E-200L.

## Power Consumption

Power consumption in the ispLSI 2064E device depends on two primary factors: the speed at which the device is operating and the number of Product Terms used.

Figure 3 shows the relationship between power and operating speed.

**Figure 3. Typical Device Power Consumption vs fmax**

$I_{CC}$  can be estimated for the ispLSI 2064E using the following equation:

$$I_{CC}(mA) = 7 + (\# \text{ of PTs} * 0.75) + (\# \text{ of nets} * \text{Max freq} * 0.004)$$

Where:

# of PTs = Number of Product Terms used in design

# of nets = Number of Signals used in device

Max freq = Highest Clock Frequency to the device (in MHz)

The  $I_{CC}$  estimate is based on typical conditions ( $V_{CC} = 5.0V$ , room temperature) and an assumption of two GLB loads on average exists. These values are for estimates only. Since the value of  $I_{CC}$  is sensitive to operating conditions and the program in the device, the actual  $I_{CC}$  should be verified.
