### **Understanding Embedded - FPGAs (Field Programmable Gate Array)**

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### **Applications of Embedded - FPGAs**

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

## Power-On/Off Power Supply Sequencing

The recommended power-on sequence is  $V_{CCINT}$ ,  $V_{CCBRAM}$ ,  $V_{CCAUX}$ , and  $V_{CCO}$  to achieve minimum current draw and ensure that the I/Os are 3-stated at power-on. The recommended power-off sequence is the reverse of the power-on sequence. If  $V_{CCINT}$  and  $V_{CCBRAM}$  have the same recommended voltage levels then both can be powered by the same supply and ramped simultaneously. If  $V_{CCAUX}$  and  $V_{CCO}$  have the same recommended voltage levels then both can be powered by the same supply and ramped simultaneously.

For  $V_{CCO}$  voltages of 3.3V in HR I/O banks and configuration bank 0:

- The voltage difference between  $V_{CCO}$  and  $V_{CCAUX}$  must not exceed 2.625V for longer than  $T_{VCCO2VCCAUX}$  for each power-on/off cycle to maintain device reliability levels.
- The  $T_{VCCO2VCCAUX}$  time can be allocated in any percentage between the power-on and power-off ramps.

The recommended power-on sequence to achieve minimum current draw for the GTP transceivers is  $V_{CCINT}$ ,  $V_{MGTAVCC}$ ,  $V_{MGTAVTT}$  OR  $V_{MGTAVCC}$ ,  $V_{CCINT}$ ,  $V_{MGTAVTT}$ . There is no recommended sequencing for  $V_{MGTAVCAUX}$ . Both  $V_{MGTAVCC}$  and  $V_{CCINT}$  can be ramped simultaneously. The recommended power-off sequence is the reverse of the power-on sequence to achieve minimum current draw.

If these recommended sequences are not met, current drawn from  $V_{MGTAVTT}$  can be higher than specifications during power-up and power-down.

- When  $V_{MGTAVTT}$  is powered before  $V_{MGTAVCC}$  and  $V_{MGTAVTT} - V_{MGTAVCC} > 150$  mV and  $V_{MGTAVCC} < 0.7$  V, the  $V_{MGTAVTT}$  current draw can increase by 460 mA per transceiver during  $V_{MGTAVCC}$  ramp up. The duration of the current draw can be up to  $0.3 \times T_{MGTAVCC}$  (ramp time from GND to 90% of  $V_{MGTAVCC}$ ). The reverse is true for power-down.
- When  $V_{MGTAVTT}$  is powered before  $V_{CCINT}$  and  $V_{MGTAVTT} - V_{CCINT} > 150$  mV and  $V_{CCINT} < 0.7$  V, the  $V_{MGTAVTT}$  current draw can increase by 50 mA per transceiver during  $V_{CCINT}$  ramp up. The duration of the current draw can be up to  $0.3 \times T_{VCCINT}$  (ramp time from GND to 90% of  $V_{CCINT}$ ). The reverse is true for power-down.

**Table 6** shows the minimum current, in addition to  $I_{CCQ}$ , that is required by Artix-7 devices for proper power-on and configuration. If the current minimums shown in **Table 5** and **Table 6** are met, the device powers on after all four supplies have passed through their power-on reset threshold voltages. The FPGA must not be configured until after  $V_{CCINT}$  is applied.

Once initialized and configured, use the Xilinx Power Estimator (XPE) tools to estimate current drain on these supplies.

## DC Input and Output Levels

Values for  $V_{IL}$  and  $V_{IH}$  are recommended input voltages. Values for  $I_{OL}$  and  $I_{OH}$  are guaranteed over the recommended operating conditions at the  $V_{OL}$  and  $V_{OH}$  test points. Only selected standards are tested. These are chosen to ensure that all standards meet their specifications. The selected standards are tested at a minimum  $V_{CCO}$  with the respective  $V_{OL}$  and  $V_{OH}$  voltage levels shown. Other standards are sample tested.

## Speed Grade Designations

Since individual family members are produced at different times, the migration from one category to another depends completely on the status of the fabrication process for each device. [Table 12](#) correlates the current status of each Artix-7 device on a per speed grade basis.

[Table 12: Artix-7 Device Speed Grade Designations](#)

Device	Speed Grade Designations		
	Advance	Preliminary	Production
XC7A100T	-2L (0.9V)		-3, -2, -2L (1.0V), -1
XC7A200T	-2L (0.9V)		-3, -2, -2L (1.0V), -1

## Production Silicon and ISE Software Status

In some cases, a particular family member (and speed grade) is released to production before a speed specification is released with the correct label (Advance, Preliminary, Production). Any labeling discrepancies are corrected in subsequent speed specification releases.

[Table 13](#) lists the production released Artix-7 device, speed grade, and the minimum corresponding supported speed specification version and ISE software revisions. The ISE software and speed specifications listed are the minimum releases required for production. All subsequent releases of software and speed specifications are valid.

1. T<sub>BCCCK\_CE</sub> and T<sub>BCCKC\_CE</sub> must be satisfied to assure glitch-free operation of the global clock when switching between clocks. These parameters do not apply to the BUFGMUX primitive that assures glitch-free operation. The other global clock setup and hold times are optional; only needing to be satisfied if device operation requires simulation matches on a cycle-for-cycle basis when switching between clocks.
2. T<sub>BGCKO\_O</sub> (BUFG delay from I0 to O) values are the same as T<sub>BCCKO\_O</sub> values.

2. IFF = Input flip-flop or latch
3. A zero "0" hold time listing indicates no hold time or a negative hold time.

**Notes:**

1. This parameter indicates the total sampling error of the Artix-7 FPGAs DDR input registers, measured across voltage, temperature, and process. The characterization methodology uses the MMCM to capture the DDR input registers' edges of operation. These measurements include:
  - CLKO MMCM jitter
  - MMCM accuracy (phase offset)
  - MMCM phase shift resolution
 These measurements do not include package or clock tree skew.
2. This parameter indicates the total sampling error of the Artix-7 FPGAs DDR input registers, measured across voltage, temperature, and process. The characterization methodology uses the BUFIO clock network and IDELAY to capture the DDR input registers' edges of operation. These measurements do not include package or clock tree skew.

**Additional Package Parameter Guidelines**

The parameters in this section provide the necessary values for calculating timing budgets for Artix-7 FPGA clock transmitter and receiver data-valid windows.

1. These values represent the worst-case skew between any two SelectIO resources in the package: shortest delay to longest delay from die pad to ball.
2. Package delay information is available for these device/package combinations. This information can be used to deskew the package.
