### Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

**Table 6** shows the minimum current, in addition to  $I_{CCQ}$ , that is required by Artix-7 devices for proper power-on and configuration. If the current minimums shown in **Table 5** and **Table 6** are met, the device powers on after all four supplies have passed through their power-on reset threshold voltages. The FPGA must not be configured until after  $V_{CCINT}$  is applied.

Once initialized and configured, use the Xilinx Power Estimator (XPE) tools to estimate current drain on these supplies.

## AC Switching Characteristics

All values represented in this data sheet are based on the speed specifications in v1.07 from the 14.4/2012.4 device pack for ISE® Design Suite14.4 and Vivado® Design Suite 2012.4 for the -3, -2, -2L (1.0V), and -1 speed grades and v1.05 from the 14.4/2012.4 device pack for the -2L (0.9V) speed grade.

Switching characteristics are specified on a per-speed-grade basis and can be designated as Advance, Preliminary, or Production. Each designation is defined as follows:

### Advance Product Specification

These specifications are based on simulations only and are typically available soon after device design specifications are frozen. Although speed grades with this designation are considered relatively stable and conservative, some under-reporting might still occur.

### Preliminary Product Specification

These specifications are based on complete ES (engineering sample) silicon characterization. Devices and speed grades with this designation are intended to give a better indication of the expected performance of production silicon. The probability of under-reporting delays is greatly reduced as compared to Advance data.

### Production Product Specification

These specifications are released once enough production silicon of a particular device family member has been characterized to provide full correlation between specifications and devices over numerous production lots. There is no under-reporting of delays, and customers receive formal notification of any subsequent changes. Typically, the slowest speed grades transition to Production before faster speed grades.

## Testing of AC Switching Characteristics

Internal timing parameters are derived from measuring internal test patterns. All AC switching characteristics are representative of worst-case supply voltage and junction temperature conditions.

For more specific, more precise, and worst-case guaranteed data, use the values reported by the static timing analyzer and back-annotate to the simulation net list. Unless otherwise noted, values apply to all Artix-7 FPGAs.

**Notes:**

1. TRACE will report all of these parameters as T<sub>RCKO\_DO</sub>.
2. T<sub>RCKO\_DOR</sub> includes T<sub>RCKO\_DOW</sub>, T<sub>RCKO\_DOPR</sub>, and T<sub>RCKO\_DOPW</sub> as well as the B port equivalent timing parameters.
3. These parameters also apply to synchronous FIFO with DO\_REG = 0.
4. T<sub>RCKO\_DO</sub> includes T<sub>RCKO\_DOP</sub> as well as the B port equivalent timing parameters.
5. These parameters also apply to multirate (asynchronous) and synchronous FIFO with DO\_REG = 1.
6. T<sub>RCKO\_FLAGS</sub> includes the following parameters: T<sub>RCKO\_AEMPTY</sub>, T<sub>RCKO\_AFULL</sub>, T<sub>RCKO\_EMPTY</sub>, T<sub>RCKO\_FULL</sub>, T<sub>RCKO\_RDERR</sub>, T<sub>RCKO\_WRERR</sub>.
7. T<sub>RCKO\_POINTERS</sub> includes both T<sub>RCKO\_RDCOUNT</sub> and T<sub>RCKO\_WRCOUNT</sub>.
8. The ADDR setup and hold must be met when EN is asserted (even when WE is deasserted). Otherwise, block RAM data corruption is possible.
9. These parameters include both A and B inputs as well as the parity inputs of A and B.
10. T<sub>RCO\_FLAGS</sub> includes the following flags: AEMPTY, AFULL, EMPTY, FULL, RDERR, WRERR, RDCOUNT, and WRCOUNT.
11. RDEN and WREN must be held Low prior to and during reset. The FIFO reset must be asserted for at least five positive clock edges of the slowest clock (WRCLK or RDCLK).

**Notes:**

- These parameters represent the worst-case duty cycle distortion observable at the I/O flip flops. For all I/O standards, IBIS can be used to calculate any additional duty cycle distortion that might be caused by asymmetrical rise/fall times.
- The T\_CKSKEW value represents the worst-case clock-tree skew observable between sequential I/O elements. Significantly less clock-tree skew exists for I/O registers that are close to each other and fed by the same or adjacent clock-tree branches. Use the Xilinx FPGA\_Editor and Timing Analyzer tools to evaluate clock skew specific to your application.
