
Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	PIC
Core Size	8-Bit
Speed	32MHz
Connectivity	I²C, LINbus, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, POR, PWM, WDT
Number of I/O	44
Program Memory Size	14KB (8K x 14)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	1K x 8
Voltage - Supply (Vcc/Vdd)	2.3V ~ 5.5V
Data Converters	A/D 43x10b; D/A 1x5b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 125°C (TA)
Mounting Type	Surface Mount
Package / Case	28-UFQFN Exposed Pad
Supplier Device Package	28-UQFN (4x4)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic16f15385-e-mv

TABLE 1-2: PIC16(L)F15356 PINOUT DESCRIPTION (CONTINUED)

Name	Function	Input Type	Output Type	Description
RC1/ANC1/CCP2(1)/IOCC1/SOSCI	RC1	TTL/ST	CMOS/OD	General purpose I/O.
	ANC1	AN	—	ADC Channel C1 input.
	CCP2(1)	TTL/ST	CMOS/OD	CCP2 Capture Input.
	IOCC1	TTL/ST	—	Interrupt-on-change input.
	SOSCI	AN	—	32.768 kHz secondary oscillator crystal driver input.
RC2/ANC2/CCP1(1)/IOCC2	RC2	TTL/ST	CMOS/OD	General purpose I/O.
	ANC2	AN	—	ADC Channel C2 input.
	CCP1(1)	TTL/ST	CMOS/OD	CCP1 Capture Input.
	IOCC2	TTL/ST	—	Interrupt-on-change input.
RC3/ANC3/SCL1(3,4)/SCK1(1)/T2IN(1)/ IOCC3	RC3	TTL/ST	CMOS/OD	General purpose I/O.
	ANC3	AN	—	ADC Channel C3 input.
	SCL1(3,4)	I^2C	OD	MSSP1 I^2C input/output.
	SCK1(1)	TTL/ST	CMOS/OD	MSSP1 SPI clock input/output (default input location, SCK1 is a PPS remappable input and output).
	T2IN(1)	TTL/ST	—	Timer2 external input.
	IOCC3	TTL/ST	—	Interrupt-on-change input.
RC4/ANC4/SDA1(3,4)/SDI1(1)/IOCC4	RC4	TTL/ST	CMOS/OD	General purpose I/O.
	ANC4	AN	—	ADC Channel C4 input.
	SDA1(3,4)	I^2C	OD	MSSP1 I^2C serial data input/output.
	SDI1(1)	TTL/ST	—	MSSP1 SPI serial data input.
	IOCC4	TTL/ST	—	Interrupt-on-change input.
RC5/ANC5/IOCC5	RC5	TTL/ST	CMOS/OD	General purpose I/O.
	ANC5	AN	—	ADC Channel C5 input.
	IOCC5	TTL/ST	—	Interrupt-on-change input.
RC6/ANC6/TX1/CK1(1)/IOCC6	RC6	TTL/ST	CMOS/OD	General purpose I/O.
	ANC6	AN	—	ADC Channel C6 input.
	TX1	—	CMOS	EUSART1 asynchronous transmit.
	CK1(1)	TTL/ST	CMOS/OD	EUSART 1 synchronous mode clock input/output.
	IOCC6	TTL/ST	—	Interrupt-on-change input.
RC7/ANC7/RX1/DT1(3)/IOCC7	RC7	TTL/ST	CMOS/OD	General purpose I/O.
	ANC7	AN	—	ADC Channel C7 input.
	RX1	TTL/ST	—	EUSART1 Asynchronous mode receiver data input.
	DT1(3)	TTL/ST	CMOS/OD	EUSART1 Synchronous mode data input/output.
	IOCC7	TTL/ST	—	Interrupt-on-change input.

Legend: AN = Analog input or output; CMOS = CMOS compatible input or output; OD = Open-Drain
TTL = TTL compatible input; ST = Schmitt Trigger input with CMOS levels; I^2C = Schmitt Trigger input with I^2C
HV = High Voltage; XTAL = Crystal levels

Note 1: This is a PPS remappable input signal. The input function may be moved from the default location shown to one of several other PORTx pins. Refer to Table 15-4 for details on which PORT pins may be used for this signal.

2: All output signals shown in this row are PPS remappable. These signals may be mapped to output onto one of several PORTx pin options as described in Table 15-3.

3: This is a bidirectional signal. For normal module operation, the firmware should map this signal to the same pin in both the PPS input and PPS output registers.

4: These pins are configured for I^2C logic levels. The SCLx/SDAx signals may be assigned to any of the RB1/RB2/RC3/RC4 pins. PPS assignments to the other pins (e.g., RA5) will operate, but input logic levels will be standard TTL/ST, as selected by the INLVL register, instead of the I^2C specific or SMBus input buffer thresholds.

TABLE 1-3: PIC16(L)F15375/76 PINOUT DESCRIPTION (CONTINUED)

Name	Function	Input Type	Output Type	Description
RA6/ANA6/CLKOUT/IOCA6/OSC1	RA6	TTL/ST	CMOS/OD	General purpose I/O.
	ANA6	AN	—	ADC Channel A6 input.
	CLKOUT	—	CMOS/OD	FOSC/4 digital output (in non-crystal/resonator modes).
	IOCA6	TTL/ST	—	Interrupt-on-change input.
	OSC1	XTAL	—	External Crystal/Resonator (LP, XT, HS modes) driver input.
RA7/ANA7/CLKIN/IOCA7/OSC2	RA7	TTL/ST	CMOS/OD	General purpose I/O.
	ANA7	AN	—	ADC Channel A7 input.
	CLKIN	TTL/ST	—	External digital clock input.
	IOCA7	TTL/ST	—	Interrupt-on-change input.
	OSC2	—	XTAL	External Crystal/Resonator (LP, XT, HS modes) driver output.
RB0/ANB0/C2IN1+/ZCD1/$\overline{SS2}$(1)/CWG1(1)/INT(1)/IOCB0	RB0	TTL/ST	CMOS/OD	General purpose I/O.
	ANB0	AN	—	ADC Channel B0 input.
	C2IN1+	AN	—	Comparator positive input.
	ZCD1	AN	AN	Zero-cross detect input pin (with constant current sink/source).
	$\overline{SS2}$(1)	TTL/ST	—	MSSP2 SPI slave select input.
	CWG1(1)	TTL/ST	—	Complementary Waveform Generator 1 input.
	INT(1)	TTL/ST	—	External interrupt request input.
	IOCB0	TTL/ST	—	Interrupt-on-change input.
RB1/ANB1/C1IN3-/C2IN3-/SCL1(1)/SCK1(1)/IOCB1	RB1	TTL/ST	CMOS/OD	General purpose I/O.
	ANB1	AN	—	ADC Channel B1 input.
	C1IN3-	AN	—	Comparator negative input.
	C2IN3-	AN	—	Comparator negative input.
	SCL1(1)	I^2C	OD	MSSP1 I^2C input/output.
	SCK1(1)	TTL/ST	CMOS/OD	MSSP1 SPI clock input/output (default input location, SCK1 is a PPS remappable input and output).
	IOCB1	TTL/ST	—	Interrupt-on-change input.
RB2/ANB2/SDA1(1)/SDI1(1)/IOCB2	RB2	TTL/ST	CMOS/OD	General purpose I/O.
	ANB2	AN	—	ADC Channel B2 input.
	SDA1(1)	I^2C	OD	MSSP1 I^2C serial data input/output.
	SDI1(1)	TTL/ST	—	MSSP1 SPI serial data input (default input location, SDI1 is a PPS remappable input and output).
	IOCB2	TTL/ST	—	Interrupt-on-change input.
RB3/ANB3/C1IN2-/C2IN2-/IOCB3	RB3	TTL/ST	CMOS/OD	General purpose I/O.
	ANB3	AN	—	ADC Channel B3 input.
	C1IN2-	AN	—	Comparator negative input.
	C2IN2-	AN	—	Comparator negative input.
	IOCB3	TTL/ST	—	Interrupt-on-change input.

Legend: AN = Analog input or output; CMOS = CMOS compatible input or output; OD = Open-Drain
TTL = TTL compatible input; ST = Schmitt Trigger input with CMOS levels; I^2C = Schmitt Trigger input with I^2C
HV = High Voltage; XTAL = Crystal levels

Note 1: This is a PPS remappable input signal. The input function may be moved from the default location shown to one of several other PORTx pins. Refer to Table 15-4 for details on which PORT pins may be used for this signal.

2: All output signals shown in this row are PPS remappable. These signals may be mapped to output onto one of several PORTx pin options as described in Table 15-5, Table 15-6 and Table 15-6.

3: This is a bidirectional signal. For normal module operation, the firmware should map this signal to the same pin in both the PPS input and PPS output registers.

4: These pins are configured for I^2C logic levels. The SCLx/SDAx signals may be assigned to any of the RB1/RB2/RC3/RC4 pins. PPS assignments to the other pins (e.g., RA5) will operate, but input logic levels will be standard TTL/ST, as selected by the INLVL register, instead of the I^2C specific or SMBus input buffer thresholds.

TABLE 1-4: PIC16(L)F15385/86 PINOUT DESCRIPTION (CONTINUED)

Name	Function	Input Type	Output Type	Description
RB4/ANB4/ADACT(1)/IOCB4	RB4	TTL/ST	CMOS/OD	General purpose I/O.
	ANB4	AN	—	ADC Channel B4 input.
	ADACT(1)	TTL/ST	—	ADC Auto-Conversion Trigger input.
	IOCB4	TTL/ST	—	Interrupt-on-change input.
RB5/ANB5/IOCB5	RB5	TTL/ST	CMOS/OD	General purpose I/O.
	ANB5	AN	—	ADC Channel B5 input.
	IOCB5	TTL/ST	—	Interrupt-on-change input.
RB6/ANB6/CLCIN2(1)/TX2/CK2(1)/ IOCB6/ICSPCLK	RB6	TTL/ST	CMOS/OD	General purpose I/O.
	ANB6	AN	—	ADC Channel B6 input.
	CLCIN2(1)	TTL/ST	—	Configurable Logic Cell source input.
	TX2	TTL/ST	—	EUSART2 Asynchronous mode receiver data input.
	CK2(1)	TTL/ST	CMOS/OD	EUSART2 Synchronous mode clock input/output.
	IOCB6	TTL/ST	—	Interrupt-on-change input.
	ICSPCLK	ST	—	In-Circuit Serial Programming™ and debugging clock input.
RB7/ANB7/DAC1OUT2/CLCIN3(1)/ RX2/DT2(1)/IOCB7/ICSPDAT	RB7	TTL/ST	CMOS/OD	General purpose I/O.
	ANB7	AN	—	ADC Channel B7 input.
	DAC1OUT2	—	AN	Digital-to-Analog Converter output.
	CLCIN3(1)	TTL/ST	—	Configurable Logic Cell source input.
	RX2	TTL/ST	—	EUSART2 Asynchronous mode receiver data input.
	DT2	TTL/ST	CMOS/OD	EUSART2 Synchronous mode data input/output.
	IOCB7	TTL/ST	—	Interrupt-on-change input.
	ICSPDAT	ST	CMOS	In-Circuit Serial Programming™ and debugging data input/output.
RC0/ANC0/T1CKI(1)/IOCC0/SOSCO	RC0	TTL/ST	CMOS/OD	General purpose I/O.
	ANC0	AN	—	ADC Channel C0 input.
	T1CKI(1)	TTL/ST	—	Timer1 external digital clock input.
	IOCC0	TTL/ST	—	Interrupt-on-change input.
	SOSCO	—	AN	32.768 kHz secondary oscillator crystal driver output.
RC1/ANC1/CCP2(1)/IOCC1/SOSCI	RC1	TTL/ST	CMOS/OD	General purpose I/O.
	ANC1	AN	—	ADC Channel C1 input.
	CCP2(1)	TTL/ST	CMOS/OD	Capture/compare/PWM2 (default input location for capture function).
	IOCC1	TTL/ST	—	Interrupt-on-change input.
	SOSCI	AN	—	32.768 kHz secondary oscillator crystal driver input.

Legend: AN = Analog input or output; CMOS = CMOS compatible input or output; OD = Open-Drain
TTL = TTL compatible input; ST = Schmitt Trigger input with CMOS levels; I^2C = Schmitt Trigger input with I^2C
HV = High Voltage; XTAL = Crystal levels

Note 1: This is a PPS remappable input signal. The input function may be moved from the default location shown to one of several other PORTx pins. Refer to Table 15-4 for details on which PORT pins may be used for this signal.

2: All output signals shown in this row are PPS remappable. These signals may be mapped to output onto one of several PORTx pin options as described in Table 15-5, Table 15-6 and Table 15-7.

3: This is a bidirectional signal. For normal module operation, the firmware should map this signal to the same pin in both the PPS input and PPS output registers.

4: These pins are configured for I^2C logic levels. The SCLx/SDAx signals may be assigned to any of the RB1/RB2/RC3/RC4 pins. PPS assignments to the other pins (e.g., RA5) will operate, but input logic levels will be standard TTL/ST, as selected by the INLVL register, instead of the I^2C specific or SMBus input buffer thresholds.

Legend: – = unimplemented locations read as '0'. Shaded cells are not used by PORTC.

14.12 PORTF Registers

Note: Present only on PIC16(L)F15385/86.

14.12.1 DATA REGISTER

PORTF is an 8-bit wide, bidirectional port. The corresponding data direction register is TRISF (Register 14-42). Setting a TRISF bit (= 1) will make the corresponding PORTF pin an input (i.e., put the corresponding output driver in a High-Impedance mode). Clearing a TRISF bit (= 0) will make the corresponding PORTF pin an output (i.e., enable the output driver and put the contents of the output latch on the selected pin). Figure 14-1 shows how to initialize an I/O port.

Reading the PORTF register (Register 14-41) reads the status of the pins, whereas writing to it will write to the PORT latch. All write operations are read-modify-write operations. Therefore, a write to a port implies that the port pins are read, this value is modified and then written to the PORT data latch (LATF).

The PORT data latch LATF (Register 14-43) holds the output port data, and contains the latest value of a LATF or PORTF write.

14.12.2 DIRECTION CONTROL

The TRISF register (Register 14-42) controls the PORTF pin output drivers, even when they are being used as analog inputs. The user should ensure the bits in the TRISF register are maintained set when using them as analog inputs. I/O pins configured as analog inputs always read '0'.

14.12.3 INPUT THRESHOLD CONTROL

The INLVLF register (Register 14-48) controls the input voltage threshold for each of the available PORTF input pins. A selection between the Schmitt Trigger CMOS or the TTL Compatible thresholds is available. The input threshold is important in determining the value of a read of the PORTF register and also the level at which an interrupt-on-change occurs, if that feature is enabled. See Table 37-4 for more information on threshold levels.

Note: Changing the input threshold selection should be performed while all peripheral modules are disabled. Changing the threshold level during the time a module is active may inadvertently generate a transition associated with an input pin, regardless of the actual voltage level on that pin.

14.12.4 OPEN-DRAIN CONTROL

The ODCONF register (Register 14-46) controls the open-drain feature of the port. Open-drain operation is independently selected for each pin. When an ODCONF bit is set, the corresponding port output becomes an open-drain driver capable of sinking current only. When an ODCONF bit is cleared, the corresponding port output pin is the standard push-pull drive capable of sourcing and sinking current.

Note: It is not necessary to set open-drain control when using the pin for I^2C; the I^2C module controls the pin and makes the pin open-drain.

14.12.5 SLEW RATE CONTROL

The SLRCONF register (Register 14-47) controls the slew rate option for each port pin. Slew rate control is independently selectable for each port pin. When an SLRCONF bit is set, the corresponding port pin drive is slew rate limited. When an SLRCONF bit is cleared, The corresponding port pin drive slews at the maximum rate possible.

14.12.6 ANALOG CONTROL

The ANSELF register (Register 14-44) is used to configure the Input mode of an I/O pin to analog. Setting the appropriate ANSELF bit high will cause all digital reads on the pin to be read as '0' and allow analog functions on the pin to operate correctly.

The state of the ANSELF bits has no effect on digital output functions. A pin with TRIS clear and ANSELF set will still operate as a digital output, but the Input mode will be analog. This can cause unexpected behavior when executing read-modify-write instructions on the affected port.

Note: The ANSELF bits default to the Analog mode after Reset. To use any pins as digital general purpose or peripheral inputs, the corresponding ANSEL bits must be initialized to '0' by user software.

14.12.7 WEAK PULL-UP CONTROL

The WPUF register (Register 14-45) controls the individual weak pull-ups for each port pin.

14.12.8 PORTF FUNCTIONS AND OUTPUT PRIORITIES

Each pin defaults to the PORT latch data after Reset. Other output functions are selected with the peripheral pin select logic. See **Section 15.0 "Peripheral Pin Select (PPS) Module"** for more information.

Analog input functions, such as ADC and comparator inputs, are not shown in the peripheral pin select lists. Digital output functions may continue to control the pin when it is in Analog mode.

REGISTER 14-44: ANSELF: PORTF ANALOG SELECT REGISTER

* Page with Register information.

28.1.2 TIMER1 MODE RESOURCE

Timer1 must be running in Timer mode or Synchronized Counter mode for the CCP module to use the capture feature. In Asynchronous Counter mode, the capture operation may not work.

See **Section 26.0 "Timer1 Module with Gate Control"** for more information on configuring Timer1.

28.1.3 SOFTWARE INTERRUPT MODE

When the Capture mode is changed, a false capture interrupt may be generated. The user should keep the CCPxIE interrupt enable bit of the PIE6 register clear to avoid false interrupts. Additionally, the user should clear the CCPxIF interrupt flag bit of the PIR6 register following any change in Operating mode.

Note:	Clocking Timer1 from the system clock (FOSC) should not be used in Capture mode. In order for Capture mode to recognize the trigger event on the CCPx pin, Timer1 must be clocked from the instruction clock (FOSC/4).

28.1.4 CCP PRESCALER

There are four prescaler settings specified by the CCPxMODE<3:0> bits of the CCPxCON register. Whenever the CCP module is turned off, or the CCP module is not in Capture mode, the prescaler counter is cleared. Any Reset will clear the prescaler counter.

Switching from one capture prescaler to another does not clear the prescaler and may generate a false interrupt. To avoid this unexpected operation, turn the module off by clearing the CCPxCON register before changing the prescaler. Example 28-1 demonstrates the code to perform this function.

EXAMPLE 28-1: CHANGING BETWEEN CAPTURE PRESCALERS

```
BANKSEL CCPxCON     ;Set Bank bits to point
                    ;to CCPxCON
CLRF    CCPxCON     ;Turn CCP module off
MOVLW   NEW_CAPT_PS ;Load the W reg with
                    ;the new prescaler
                    ;move value and CCP ON
MOVWF   CCPxCON     ;Load CCPxCON with this
                    ;value
```

28.1.5 CAPTURE DURING SLEEP

Capture mode depends upon the Timer1 module for proper operation. There are two options for driving the Timer1 module in Capture mode. It can be driven by the instruction clock (FOSC/4), or by an external clock source.

When Timer1 is clocked by FOSC/4, Timer1 will not increment during Sleep. When the device wakes from Sleep, Timer1 will continue from its previous state.

Capture mode will operate during Sleep when Timer1 is clocked by an external clock source.

28.2 Compare Mode

Compare mode makes use of the 16-bit Timer1 resource. The 16-bit value of the CCPRxH:CCPRxL register pair is constantly compared against the 16-bit value of the TMR1H:TMR1L register pair. When a match occurs, one of the following events can occur:

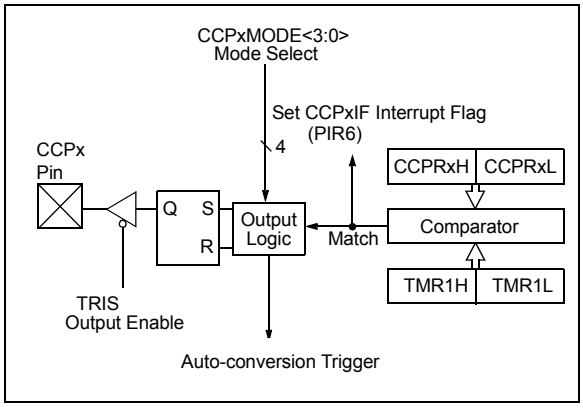
- Toggle the CCPx output
- Set the CCPx output
- Clear the CCPx output
- Generate an Auto-conversion Trigger
- Generate a Software Interrupt

The action on the pin is based on the value of the CCPxMODE<3:0> control bits of the CCPxCON register. At the same time, the interrupt flag CCPxIF bit is set, and an ADC conversion can be triggered, if selected.

All Compare modes can generate an interrupt and trigger and ADC conversion.

Figure 28-2 shows a simplified diagram of the compare operation.

FIGURE 28-2: COMPARE MODE OPERATION BLOCK DIAGRAM



30.1.2 PUSH-PULL MODE

In Push-Pull mode, two output signals are generated, alternating copies of the input as illustrated in Figure 30-2. This alternation creates the push-pull effect required for driving some transformer-based power supply designs.

The push-pull sequencer is reset whenever EN = 0 or if an auto-shutdown event occurs. The sequencer is clocked by the first input pulse, and the first output appears on CWG1A.

The unused outputs CWG1C and CWG1D drive copies of CWG1A and CWG1B, respectively, but with polarity controlled by the POLC and POLD bits of the CWG1CON1 register, respectively.

30.1.3 FULL-BRIDGE MODES

In Forward and Reverse Full-Bridge modes, three outputs drive static values while the fourth is modulated by the input data signal. In Forward Full-Bridge mode, CWG1A is driven to its active state, CWG1B and CWG1C are driven to their inactive state, and CWG1D is modulated by the input signal. In Reverse Full-Bridge mode, CWG1C is driven to its active state, CWG1A and CWG1D are driven to their inactive states, and CWG1B is modulated by the input signal. In Full-Bridge mode, the dead-band period is used when there is a switch from forward to reverse or vice-versa. This dead-band control is described in **Section 30.5 “Dead-Band Control”**, with additional details in **Section 30.6 “Rising Edge and Reverse Dead Band”** and **Section 30.7 “Falling Edge and Forward Dead Band”**.

The mode selection may be toggled between forward and reverse toggling the MODE<0> bit of the CWG1CON0 while keeping MODE<2:1> static, without disabling the CWG module.

0 = CLCIN0 (inverted) is not gated into CLCx Gate 1

33.1.2.3 Receive Interrupts

The RXxIF interrupt flag bit of the PIR3 register is set whenever the EUSART receiver is enabled and there is an unread character in the receive FIFO. The RXxIF interrupt flag bit is read-only, it cannot be set or cleared by software.

RXxIF interrupts are enabled by setting all of the following bits:

- RXxIE, Interrupt Enable bit of the PIE3 register
- PEIE, Peripheral Interrupt Enable bit of the INTCON register
- GIE, Global Interrupt Enable bit of the INTCON register

The RXxIF interrupt flag bit will be set when there is an unread character in the FIFO, regardless of the state of interrupt enable bits.

33.1.2.4 Receive Framing Error

Each character in the receive FIFO buffer has a corresponding framing error Status bit. A framing error indicates that a Stop bit was not seen at the expected time. The framing error status is accessed via the FERR bit of the RCxSTA register. The FERR bit represents the status of the top unread character in the receive FIFO. Therefore, the FERR bit must be read before reading the RCxREG.

The FERR bit is read-only and only applies to the top unread character in the receive FIFO. A framing error (FERR = 1) does not preclude reception of additional characters. It is not necessary to clear the FERR bit. Reading the next character from the FIFO buffer will advance the FIFO to the next character and the next corresponding framing error.

The FERR bit can be forced clear by clearing the SPEN bit of the RCxSTA register which resets the EUSART. Clearing the CREN bit of the RCxSTA register does not affect the FERR bit. A framing error by itself does not generate an interrupt.

Note:	If all receive characters in the receive FIFO have framing errors, repeated reads of the RCxREG will not clear the FERR bit.

33.1.2.5 Receive Overrun Error

The receive FIFO buffer can hold two characters. An overrun error will be generated if a third character, in its entirety, is received before the FIFO is accessed. When this happens the OERR bit of the RCxSTA register is set. The characters already in the FIFO buffer can be read but no additional characters will be received until the error is cleared. The error must be cleared by either clearing the CREN bit of the RCxSTA register or by resetting the EUSART by clearing the SPEN bit of the RCxSTA register.

33.1.2.6 Receiving 9-Bit Characters

The EUSART supports 9-bit character reception. When the RX9 bit of the RCxSTA register is set the EUSART will shift nine bits into the RSR for each character received. The RX9D bit of the RCxSTA register is the ninth and Most Significant data bit of the top unread character in the receive FIFO. When reading 9-bit data from the receive FIFO buffer, the RX9D data bit must be read before reading the eight Least Significant bits from the RCxREG.

33.1.2.7 Address Detection

A special Address Detection mode is available for use when multiple receivers share the same transmission line, such as in RS-485 systems. Address detection is enabled by setting the ADDEN bit of the RCxSTA register.

Address detection requires 9-bit character reception. When address detection is enabled, only characters with the ninth data bit set will be transferred to the receive FIFO buffer, thereby setting the RXxIF interrupt bit. All other characters will be ignored.

Upon receiving an address character, user software determines if the address matches its own. Upon address match, user software must disable address detection by clearing the ADDEN bit before the next Stop bit occurs. When user software detects the end of the message, determined by the message protocol used, software places the receiver back into the Address Detection mode by setting the ADDEN bit.

33.2 Clock Accuracy with Asynchronous Operation

The factory calibrates the internal oscillator block output (INTOSC). However, the INTOSC frequency may drift as V_{DD} or temperature changes, and this directly affects the asynchronous baud rate. Two methods may be used to adjust the baud rate clock, but both require a reference clock source of some kind.

The first (preferred) method uses the OSCTUNE register to adjust the INTOSC output. Adjusting the value in the OSCTUNE register allows for fine resolution changes to the system clock source. See **Section 9.2.2.2 "Internal Oscillator Frequency Adjustment"** for more information.

The other method adjusts the value in the Baud Rate Generator. This can be done automatically with the Auto-Baud Detect feature (see **Section 33.3.1 "Auto-Baud Detect"**). There may not be fine enough resolution when adjusting the Baud Rate Generator to compensate for a gradual change in the peripheral clock frequency.

REGISTER 33-4: RCxREG(1): RECEIVE DATA REGISTER

R-0	R-0	R-0	R-0	R-0	R-0	R-0	R-0
RCxREG<7:0>							
bit 7							bit 0
